E. R. ASHTON, Esq. (gr. Mr. C. Kent), Broadlands, Tunbridge Wells, submitted a lovely specimen of *Sophrontitis grandiflora* carrying thirty flowers (Cultural Commendation), *Dendrobium Brymerianum*, *D. atro-vioaceum*, the fine old *Odontoglossum triumphans* var. *Lionel Crawshaw*, *Odontioda Fairy Queen*, *Laelio-Cattleya Faust*, and *Lycaste Balliae*, among other good things.

*Dendrobium Devonianum* and the allied *D. Freemanii* were conspicuously beautiful in Messrs. SANDER'S group, where also *Cymbidium Erica* var. *Eclipse* and the deep, ruddy-bronze *C. Magali Sander* var. *Surprise*, arrested attention. *Laelio-Cattleya Royal Sovereign*, *Oncidium pulchellum*, *Ada aurantiaca*

and *Dendrobium Wardianum* were included, with several *Odontoglossums* and *Odontiodas*.

Messrs. J. CYPHER AND SONS exhibited a small group of *Cymbidiums*, *Odontoglossums* and *Dendrobiums*. Notable examples shown were of *Dendrobium atro-vioaceum*, *D. crepidatum* (a fine form), *Maxillaria Harrisoniae*, *Odontoglossum Edwardsii*, *Laelio-Cattleya Dominiana* and the curious, yellow *Eria pannea*. Mr. H. DIXON contributed a small group containing *Dendrobium Thwaitesiae*, *Cypripedium Cupid* and *Odontoglossums*. Messrs. SUTTON Bros. exhibited *Lycaste Skinneri*, *Odontoglossum triumphans* and *Cypripedium Maudiae* in a small corner group.

The large exhibit from Messrs. CHARLES-WORTH AND CO. contained a fine centre grouping of *Odontoglossum crispum* in variety, and around this was displayed capital specimens of *Wilsonara Wendy*, *Vuykstekeara Lutetia*, *Cypripedium niveum*, *C. Morganiae burfordiense*, *Odontioda Karao*, *Odontoglossum Regium*, *Sophrone-Laelio-Cattleya Meuse*, *Brasso-Cattleya Olona* and many other fine Orchids.

In Messrs. STUART LOW AND CO.'S group a few of the more attractive subjects were *Dendrobium Farmeri*, *Cymbidium Devonianum*, *Brasso-Cattleya Hans Hunter*, *B.-C. Milo*, *Laelio-Cattleya Jacquinetta*, the old and still beautiful *Cochlidia Noezliana* and *Odontoglossum Zena*.

#### Floral Committee.

*Present:* Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Charles E. Pearson, Mr. A. Turner, Mr. H. J. Jones, Mr. William Howe, Mr. D. Ingamells, Mr. J. M. Bridgeford, Mr. Donald Allan, Mr. Hugh Dickson, Mr. M. C. Allwood, Mr. R. Findlay, Mr. E. R. James, Mr. A. E. Vasey, Mr. James B. Riding, Mr. W. B. Gingell, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mrs. Ethel M. Wightman, Mr. Courtney Page and Mr. Cartwright (Secretary).

Section B.—Mr. Gerald B. Loder (in the chair), Mr. W. J. Bean, Mr. R. C. Notcutt, Mr. George Harrow, Mr. G. Reuthe, Mr. Amos Perry, Mr. Eric M. Marsden-Jones, Mr. Reginald Cory, Mr. A. Williams, Mr. L. R. Russell, Mr. E. H. Wilding, Mr. G. Yeld, Mr. A. Bedford, Mr. T. Hay, Mr. Charles T. Musgrave, Mr. F. G. Preston, Mr. W. G. Baker, Mr. Clarence Elliott, Mr. W. B. Cranfield, Mr. E. A. Bowles, Mr. R. D. Trotter and Mr. N. K. Gould (Secretary).

#### AWARDS OF MERIT.

*Acacia fimbriata*.—According to the *Index kewensis*, the correct name of this *Mimosa* is *A. prominens*. It is a very graceful species furnished with narrow, dark green leaves and bearing plenty of short spikes of yellow flowers. Shown by the DIRECTOR, Royal Botanic Gardens, Kew.

*Arctotis breviscapa* var. *Durns*.—In *Index kewensis*, *Arctotis breviscapa* is recorded as a synonym of *A. leptorhiza*, while Nicholson's *Dictionary of Gardening* states that it is a synonym of *A. speciosa*. On June 29, 1926, the species, when shown by Mr. T. Hay, received an Award of Merit. The variety *Durns* is a more robust plant. The pinnate leaves are quite attractive and the sturdy flowers are of rich cardinal red, with lines of a deeper shade of colour. An illustration of *A. breviscapa* was given in *The Gardeners' Chronicle* of July 10, 1926. Shown by Messrs. B. LADHAMS, LTD.

*Arctotis scapigera*.—The name of this species must be considered to be provisional, for according to the *Index kewensis*, *A. scapigera* should be *A. acaulis*, but a certain amount of confusion exists in the genus. Mr. T. Hay informs us that he received seeds from South Africa under the name *A. acaulis*, but his plants differ from that species as grown at Kew. The seedlings are variable in habit, foliage and colour of the flowers, though the general colour of the latter seemed to be a bright orange with a darker zone, but the colour was dull on the older flowers. Shown by Mr. T. HAY, Hyde Park.

*Auricula Duchess of York*.—A very handsome Alpine variety. The large, perfectly round flowers are of rich, velvety plum-purple colour, paler at the margins of the petals,

and have a broad, pale yellow zone. Shown by Mr. JAMES DOUGLAS.

*Auricula Prince Henry*.—This is a beautiful Show Auricula of uncommon colouring. A vigorous plant, well-furnished with mealy leaves and bearing a stout spike, was shown. The colour is satiny mauve, and the flowers have a broad, white zone. Also shown by Mr. JAMES DOUGLAS.

*Camellia Lady Clare*.—A very handsome semi-double variety, bearing flowers as large as those of *C. reticulata*. The colour is a medium pink, and it appears to be a vigorous shrub. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Hants.

*Carnation Mrs. A. J. Cobb* (see Fig. 124).—This handsome, velvety-crimson-maroon variety was awarded the *Daily Mail* Cup as being the best new fragrant Carnation at the show of the British Carnation Society last week (see page 238). Shown by Mr. A. F. DUTTON.

*Carnation W. H. Page*.—A medium-sized, Perpetual-flowering variety, which appears to be very free-flowering. The flowers are bright pink with lines of a deeper shade of the same colour. The blooms are well-formed and have lightly serrated edges; the calyx is non-splitting. Shown by Mr. W. H. PAGE.

*Prunus incisa*.—A dwarf species from Japan which produces clusters of pendulous, white flowers which open widely. Shown by Mr. COLLINGWOOD INGRAM, Benenden.

*Prunus serrulata Yoshira* (*Yedoensis*).—This is a graceful little tree, bearing plentiful clusters of rounded, single, pale blush flowers. Shown by Mr. R. C. NOTCUTT.

*Rhododendron carneum*.—This handsome, evergreen species was discovered by Browne in the Northern Shan States, North Burma, at an altitude of 7,500 feet, in 1912. It belongs to the Maddenii series and makes a bush three feet to four feet in height. The large, ovate leaves have plentiful greyish spots on the upper surface and are silvery below. The flowers are large, open widely and are produced in a loose truss. They are of flesh-pink colour. Shown by LIONEL DE ROTHSCHILD, Esq.

#### GROUPS.

Immediately inside the hall, Messrs. L. R. RUSSELL, LTD., arranged a large group of *Azalea indica* varieties which provided a fine display of colouring. The many plants illustrated the various methods of growing this useful greenhouse flowering shrub, and the exhibit comprised many of the best varieties.

Some tall plants of *Acacia Riceana*, *A. spiralis* and *A. leprosa* formed a good background to a collection of *Hippeastrums*, *Grevillea alpina* and *Camellias* staged by Messrs. STUART LOW AND CO. Messrs. R. GILL AND SON showed an attractive collection of *Rhododendrons*, chiefly of the type grown in the warmer parts of the country. They also exhibited sprays of several shrubby *Veronicas* and a batch of *St. Brigid Anemones*.

*Rhododendrons* were also shown by Mr. G. Reuthe, who had good trusses of *R. Elsa* and *R. arboreum* varieties. He also staged well-flowered sprays of *Stachyurus praecox* and various alpinas. In association with profusely-flowered *Azalea mollis* hybrids and *Azalea Hinomanya*, Messrs. WM. CUTBUSH AND SON showed *Tulipa praestans* of brilliant colour.

Rock gardens, appropriately planted, were made by various exhibitors. Messrs. W. H. ROGERS AND SON made a special feature of *Daphne Cneorum*, and also had various seasonable alpinas. Messrs. M. PRICHARD AND SONS gave the central place to a pretty drift of *Asperula suberosa*, and also used *Aubrietias* and *Saxifrages* effectively. Messrs. HODSONS, LTD., had good breadths of *Primula denticulata* and *P. Julia*, while in the background they planted *Wistarias*, *Azalea malvatica* and other shrubs.

*Tulipa Clusiana*, various *Sedums*, *Saxifrages*, *Anemone graeca* hybrids and *Drabas* were utilised by Messrs. TUCKERS, LTD. The Misses HOPKINS and Mr. J. ROBINSON had interesting little rock garden exhibits. In a well-designed

rock garden Mr. CLARENCE ELLIOTT planted a large quantity of *Primula pubescens* Mrs. J. H. Wilson and also well-placed sweeps of *Viola gracilis* Golden Wave and *Primula marginata* Linda Pope.

In their rock garden, Messrs. WATERER, SONS AND CRISP planted *Erythronium Dens-canis* E. D.-c. White Beauty, *E. Hendersonii*, *E. revolutum* var. *Johnsonii* and various *Primroses*, and in the background placed well-flowered *Forsythias*, *Spiraeas* and other flowering shrubs. Messrs. B. LADHAMS, LTD., showed *Caltha palustris* fl. pl., *Omphalodes cappadocica*, *Primulas* in variety and early *Irises*. Messrs. Maxwell and BEALE gave prominence to *Erica carnea* and *Gentiana acaulis*; while Messrs. JEANS AND TROWBRIDGE had an attractive batch of *Polygala Chamaebuxus purpurea*, *Primula altaica* and the dwarf *Rosa Roulettii* in the exhibit of Mr. F. G. Wood attracted attention.

An admirable collection of alpinas in pots and pans was again shown by C. G. KIRCH, Esq. (gr. Mr. J. Wall), Edenhall, Beckenham. On the present occasion he had a splendid pan of *Primula* Mrs. J. H. Wilson, and also showed a good pot of *P. Arkwrightii*, bearing very large flowers. Other plants well worthy of special mention were *Epigaea repens*, *Saxifraga Grisebachii*, *S. Arco Valley*, *S. Bridget*, *Armeria caespitosa*, *Arabis bellidifolia*, *Dodecatheon Hendersonii* and *Primula rosea splendens*. Messrs. BAKERS, LTD., showed *Brooms*, *Deutzia*, Japanese *Cherries* and various alpinas. Messrs. REAMSBOTTOM AND CO. had a good exhibit of *St. Brigid Anemones*. Violets were shown by Mr. J. J. KETTLE and Mr. B. PINNEY.

Messrs. SUTTON AND SONS had an attractive exhibit of *Cineraria Feltham Beauty* strain in rich pink, blue, salmon and rose shades of colour. Carnations of good quality were shown by Messrs. C. ENGELMANN, LTD., Messrs. ALLWOOD BROS. and Messrs. STUART LOW AND CO.

A large collection of splendidly grown *Schizanthus* was staged by Messrs. BLACKMORE AND LANGDON. These were *S. Wisetonensis* hybrids, and illustrated a first-class strain which produced a wide range of beautiful colours. Mr. JAMES DOUGLAS had a good exhibit of *Auriculas* of both the Show and the Alpine varieties. Seedling *Freesias* in various colours, and a number of named varieties, were shown by Mr. G. H. DALRYMPLE.

Pot Roses were staged by Messrs. CHAPLIN BROS., whose chief varieties were *Royal Scarlet*, *Mrs. Dunlop Best*, *Sovereign*, *Chatillon Rambler* and *American Pillar*. They also had vases of *Mrs. Herbert Nash*, *Richmond* and *Ophelia*. By the Tea Annexe, Mr. J. H. PEMBERTON had an attractive group of *Polyantha* Roses. The principal varieties were *Ella Poulsen*, *Grass an Aache*, *White Ella Poulsen*, *Edith Cavell*, *Topsis* and *Eblouissant*.

Good vases of cut Roses were staged by Mr. GEORGE PRINCE, who had fine blooms of *Richmond*, *Lord Lambourne*, *I. Zingari*, *Mrs. H. Stevens*, *Victoria* and *Paul's Scarlet Climber*. The principal Roses shown by Mr. ELISHA J. HICKS were climbing *Lady Hillingdon*, *Mrs. Elisha J. Hicks*, *Mrs. H. Stevens* and *Madame Edouard Herriot*.

*Polyanthuses* of exceptional quality were staged by Messrs. DOBBIE AND CO., Mr. H. J. JONES and Mr. G. W. MILLER, and the last-named also showed *Darwin Tulips*.

#### Narcissus and Tulip Committee.

*Present*: Mr. E. A. Bowles (in the chair), Mr. G. W. Leak, Mr. William Poupart, Mr. C. W. Needham, Sir Daniel Hall, Mr. J. Jones, Miss E. Willmott, Mr. F. Secrett, Mr. F. Herbert Chapman, Mr. W. B. Cranfield, Mr. J. Duncan Pearson, Mr. P. R. Barr, Mr. Charles H. Curtis, Mr. W. F. Copeland, Mr. Alfred W. White and Mr. A. Simmonds (Secretary).

#### AWARDS OF MERIT.

*Narcissus Suda* (4a).—A beautiful giant Leedsii variety, the flowers being bold and of fine substance. Perianth white, trumpet soft sulphur-yellow, fairly wide at the mouth. Shown by Messrs. HERBERT CHAPMAN, LTD.

*Narcissus Eskimo* (I.b.).—A shapely flower of fair size; perianth soft white; trumpet cream-coloured, with slightly deeper tint on the frill. This variety was registered as I.b. (white trumpet), but several members of the Committee considered it to be a 4a. (giant Leedsii); anyhow, it is an elegant Daffodil, and on the border line between the Trumpet and Leedsii sections. Shown by the DONARD NURSERY CO., Newcastle, Co. Down.

#### GROUPS.

A large collection arranged by Messrs. BARR AND SONS included many exceptionally good seedlings, principally of the *Incomparabilis* type, with vividly coloured coronas, though there were seedlings of other types of considerable merit. Their named varieties included *Mustapha*, *King Alfred*, *MacMahon*, *Ben Hur*, and *Alasman*, richly coloured Trumpet varieties; *Lavender*, a small Leedsii, with a fascinating orange-coloured rim to the corona; *Surprise*, *Bernardino* and *Gallipoli*, large *Incomparabilis* varieties, with vivid, orange coronas; *Ibis*, a shapely *Poeticus*, and *Mountain Pride*, a *Barrii* bloom of yellow colour, with a narrow orange rim to the corona.

Seedlings of merit were also included in their large collection by the DONARD NURSERY CO., who also had excellent vases of *Gog. Magog*, *Comely*, *White Nile*, *Moirs O'Neill* and *Clare de Lune*, of the large Trumpet section; *Fortune's Giant*, an *Incomparabilis* with an orange cup, and *Dragoon*, a large *Barrii* variety. *Lady Bird*, a small, star-like *Incomparabilis* with a vivid corona, was particularly attractive in the collection of Mr. J. W. BARR. He also staged especially good blooms of *Sunrise*, a lovely *Barrii* variety; *Flame*, an *Incomparabilis* with an attractive orange-coloured Picotee edge to the corona; and *W. J. Grant*, a large bicolor Trumpet.

The *Incomparabilis* varieties, both as new seedlings of merit and named varieties, were prominent in a good exhibit arranged by Messrs. J. R. PEARSON AND SONS. They had fine vases of *Tosca*, *Isabel*, *Red Eye* and *John Evelyn*. The last-named has a broad, frilled corona of great charm. In the centre of this well-arranged group there was a good vase of *Mrs. R. D. Backhouse*, a Trumpet variety with a beautiful Peach-shaded tube. *Mrs. Barclay*, a *Barrii* variety with a flattish corona, was also very attractive.

Seedlings of several types were shown by Messrs. R. H. BATH, LTD., who also had excellent vases of *Fiery Knight*, a large double with a definite yellow perianth and a cluster of vivid orange and yellow segments; *Gaiety*, an *Incomparabilis* with a pretty, frilled corona, and *Orange Glow*, of similar type, were also of great merit. Mr. W. F. M. COPELAND had a small but choice collection of double Daffodils.

Some very good seedlings were staged by Messrs. H. CHAPMAN, LTD., who also showed in *White Nile* and *Holmdale* two very good white Trumpets. *Imperial*, a large Trumpet with pale yellow perianth and a richer-coloured, widely expanded tube, and *Fortunatus*, which has a bright orange corona, were exceptionally good varieties. In the Annexe, Messrs. STEWART AND SON, LTD., showed a collection of *Narcissus*, which included *Horace*, *Coeur de Lion*, *King Alfred*, *Soleil d'Or*, *Argent* and *Van Waveren's Giant*.

Pot plants, set in fresh moss, shown by Messrs. SUTTON AND SONS, included attractive groups of such good *Incomparabilis* as *Red Eye*, *Gallipoli*, *Salembro*, *Robin Adair* and *Milford Haven*. They also included *Life Guard*, a bicolor Trumpet, and *Lovenest*, a Trumpet with a paper-white perianth and Peach-stained tube.

A large group of *Darwin Tulips* was arranged with considerable skill by Messrs. J. CARTER AND CO. Along the centre they placed well-flowered specimens of *Prunus triloba* fl. pl. The principal Tulips were *Professor Rawenhoff*, rich rose; *Mauve Claire*, *Frans Hals*, and *Afterglow*, of salmon-pink shades; *William Pitt*, rich cardinal; *Princess Elizabeth*, medium pink; and *La Tulipe Noir*.

**Fruit and Vegetable Committee.**

**Present:** Mr. C. G. A. Nix (Chairman), Mr. J. Cheal, Mr. A. Bullock, Mr. G. F. Tinley, Mr. H. Markham, Mr. W. F. Giles, Mr. F. Jordan, Mr. Edward Beckett, Mr. A. Poupart, Mr. A. C. Smith, Mr. H. Prince, Mr. W. H. Divers, Mr. E. A. Bunyard, Mr. A. Metcalfe and Mr. A. N. Rawes (Secretary).

The only exhibit before this Committee comprised two dishes of Pears from Mr. G. L. LANGRIDGE, Nina Park Orchards, Athi River, Kenya Colony. They were labelled Williams's Bon Chretien and Kieffer respectively, but neither of the fruits were like those grown in this country, and although the "Williams" was doubtless true, doubts were expressed as to the correct name of the other. The flavour of both was very good.

**MANCHESTER AND NORTH OF ENGLAND ORCHID.**

At the Meeting held on March 3, 1927, the members of Committee present were Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. A. Burns, Mr. A. Coningsby, Mr. J. Cypher, Mr. J. Evans, Mr. A. Keeling, Mr. J. Lupton, Mr. D. McLeod and H. Arthur (Secretary).

**FIRST CLASS CERTIFICATES.**

*Cattleya Prince Shimadzu* var. *Springtide* (*Tityus* × *Hardyana*).—A large, shapely flower, white with slight pinkish tinge; lip with crimson lines and yellow throat. A Silver-Gilt Medal was awarded.

*Odontoglossum St. George* var. *Albion* (*eximium* × *Alexandria*). Both from the late H. T. PITT, Esq.

*Odontioda Olympia* var. *nigrum* (*Oda. Charlesworthii* × *Odm. Olympia*).—A large flower of good shape; sepals and petals deep maroon, lip flat, deep brick red. From J. B. ADAMSON, Esq.

**AWARDS OF MERIT.**

*Odontioda Colinge* var. *Arminii*; *Oda. Colinge* var. *Adrien*; *Oda. Bonar Law* (*Oda. Coronation* × *Odm. ardentissimum*); *Cypripedium Scipio* (*Bassano* × *Euryades*); *C. Minotaur* var. *Radiance*; *C. Perseus*, Townley Grove var.; *C. Thebian* (*niveum* × *aureum virginalae*); *Cattleya Clotho* var. *Ursus*; *Lycaste Skinneri* var. *Hannibal*. All from J. B. ADAMSON, Esq.

*Cypripedium Memoria* F. M. Ogilvie, Chardwar var.; *C. Rob Roy* (*Idina langleyense* × *Christopher*); *C. Rowland* (*Vandyke* × *Peter*); *Dendrobium Mora* (*nobile* Sir F. W. Moore × *Rubens grandiflorum*); *Miltonia Wm. Pitt* var. *Purple Monarch*; *Laelio-Cattleya Hassallii* alba, Rossii var.; *Cattleya White Empress* (*Trianae*, Brownhill var. × *Susanne Hye de Crom*). All from the late H. T. PITT, Esq.

*Laelio-Cattleya Zeno* (*C. Luegeae* × *L.-C. St. Jothard*), *Brasso-Cattleya Ajax*, Llewelyn's var.; *Cypripedium Eurybiades*, Llewelyn's var.; *Odontoglossum Albion* (*Lambeaunianum* × *Rossii*); *Dendrobium Merlin* var. Mrs. G. V. Llewelyn; *D. Merlin* var. *Rex*. All from G. V. LLEWELYN, Esq.

*Cymbidium Pauwelsii* var. *Norah*; *C. Alexanderi* var. *Alice*; and *Odontoglossum Carola* var. *Mary*. From the Hon. G. E. VESTEY.

*Brasso-Laelio-Cattleya Lyra* (*L.-C. callistoglossa* × *B.-C. Apollo*); *Brasso-Cattleya frigida* (*C. Blackii* alba × *B. glauca*). From Mrs. BRUCE and Miss WRIGLEY.

*Odontoglossum Clydoma*, Beardwood var. From Col. Sir J. RUTHERFORD, Bart.

**AWARD OF APPRECIATION.**

*Cypripedium* Mrs. Francis Horner (*Beckmanii* × *nitens Leeannum*). From J. B. ADAMSON, Esq.

**BOTANICAL CERTIFICATE (FIRST CLASS).**

*Coelogyne sparsa* and *Epidendrum pumilum*. From the late H. T. PITT, Esq.

**CULTURAL CERTIFICATE.**

To Mr. A. BURNS, for *Lycaste Tunstillii*; to Mr. B. COLLINS, for *Cymbidiums* in variety; to Mr. J. HOWES, for *Lycaste Skinneri* and

*Odontioda Olympia* var. *nigrum*; and to Mr. G. V. LLEWELYN, for *Cypripedium Euryades* New Hall Hey var.

**GROUPS.**

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded; *Odontoglossums* in variety, *Odontioda Olympia* var. *nigrum*, *O. Colinge* var. *Adrien* and *O. Arminii*; *Cypripedium Perseus* var. *Townley Grove*, *C. Beta*, *C. Minotaur* var. *Radiance*, *C. Thebian*, *C. Mrs. Francis Horner*, *C. Princess Patricia*, *Cattleya Clotho* var. *Ursus*; *L.-C. Luminosa aurea*; *Masdevallia Schröderiana*, with *Lycastes* and *Cymbidiums* were included.

The late H. T. PITT, Esq., London (gr. Mr. F. W. Thurgood), was also awarded a Gold Medal for a most interesting group that included *Cypripedium F. M. Ogilvie*, *Chardwar* var., *C. Rob Roy* and *C. Robert Paterson*; *Cattleya Prince Shimadzu* var. *Springtide* and *C. White Empress*; *Odontoglossum St. George* var. *Albion*; *Miltonia Wm. Pitt* var. *Purple Monarch*, and *Dendrobium Norah*.

The Hon. G. E. VESTEY, Southport (gr. Mr. B. Collins), was awarded a Silver-Gilt Medal for a group of *Cymbidiums* in variety, including *C. Alexanderi* vars. *Alice*, *roseum* and *Margarita*; *C. Auriga Vesteyanum*, *C. Miranda*, *C. President Wilson*, *C. Martin* and *C. Petrel*.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a Large Silver Medal for a group containing *Cypripedium Archie Nield*, *C. Halo*, *C. nitens-Leeannum Sunrise*, *C. Actaeus* var. *Lady Greensleeves*, *Odontoglossum crispum* in variety; *Lycaste Tunstillii*, *L. Imshootiana* and forms of *L. Skinneri*, with *Cymbidiums* and *Brasso-Cattleyas*.

G. V. LLEWELYN, Esq., Southport, staged a group to which a Silver Medal was awarded. This included *Cypripedium Eurybiades*, Llewelyn's var., *C. Mrs. Francis Horner* and *C. Euryades*, New Hall Hey var., *Odontoglossum Albion* and *O. Woodroffeae*, *Brasso-Cattleya Ajax*, Llewelyn's var., *Cirrhoptalum picturatum* and *Dendrobiums*.

Col. Sir J. RUTHERFORD, Bart., Blackburn (gr. Mr. J. Lupton), staged *Odontoglossum Cliftoniae*, Beardwood var.

Messrs. J. CYPHER AND SONS were awarded a Silver Medal for a group of *Cypripediums* and *Dendrobiums* in variety, with *Odontoglossum Rossii*, *Cymbidium Alexanderi*, *Cattleya Maggie Raphael*, *Ada aurantiaca*, *Oncidium cheiroporum*, etc. Messrs. KEELING AND SONS, Bradford, exhibited *Cypripediums*, *Odontoglossum Wiganianum*, *Odontioda Dacia*, *Dendrobium Brymerianum* and *Cymbidium Felicity*. Mr. J. EVANS, Colwyn Bay, sent *Dendrobiums* and *Cypripediums* in variety.

**Obituary.**

**E. White.**—On the morning of March 31, Mr. E. White passed away peacefully, after an illness of only two days' duration. Mr. White was for nearly forty years gardener at Cranford Hall, Kettering, Northamptonshire. He was seventy-five years of age and had lived in semi-retirement at Barnwell for some years. He is survived by a daughter and two sons.

**Joseph Sanderson.**—We regret to learn of the death of Mr. Joseph Sanderson, at The Rosary, Glen Conway, who was for a long period associated with the famous gardens at Bodnant. Previous to taking charge at Bodnant, Mr. Sanderson spent seven years at Chatsworth, where he obtained a wide experience of many phases of horticultural activities. In 1881, the late Mr. H. D. Pochin—father of Lady Aberconway—was developing the Bodnant estate, and Mr. Sanderson was invited to take charge of the gardens and carry out many improvements and extensions. After the death of Mr. Pochin, Mr. Sanderson served under Mrs. Pochin, and, later, again under the present Lord and Lady Aberconway, and throughout the long period of thirty years during which he was associated with the fortunes of Bodnant, he saw this fine establishment develop wonder-

fully. Over a considerable period he was famous as a fruit grower and took numerous prizes in the Chester district for Grapes and other produce. The rock garden at Bodnant owes a great deal to his skill and intelligence. He was at all times ready to impart his knowledge to interested people, thousands of whom visited Bodnant during his tenure of office. He retired about fifteen years ago (see *Gard. Chron.*, April 29, 1911), and during his retirement took a very keen interest in the affairs of the Parish of Glan Conway, also acting as Churchwarden, and supporting the schools and other institutions of the neighbourhood.

**Madame Louise Guillion.**—The death is announced in the French horticultural press of Madame Vve. Guillion, née Louise Arluison, sister of M. Gaston Arluison, the well-known Paris representative of the firm of Geo. Monro, Ltd., of Covent Garden, and International Secretary for England of the Fédération Horticole Professionnelle Internationale.

**Karl Schöne.**—We are sorry to learn of the death, on March 5, of Herr Karl Schöne, who was possibly the best-known and most successful Dahlia raiser in Germany. Over eighty excellent modern varieties were raised by him, including *Goldene Sonne*, *Meisterstück*, and the latest of all, *Andreas Hofer*. Herr Schöne was a man of attractive character, a hard worker, a true and constant friend, and affable and kindly to all with whom he came in contact. German horticulture has sustained a real loss in his death.

**Charles Sprague Sargent.**—As these pages were being passed for press the news reached us of the death of this distinguished horticulturist, whose name is inseparably associated with the famous Arnold Arboretum at Jamaica Plain, Massachusetts. He died at his home at Brookline, on the 22nd ult., aged eighty-five years.

**ANSWERS TO CORRESPONDENTS.****PRUNING AN ESCALLONIA MACRANTHA HEDGE.**

**D. G.** About mid-April would be the best time to prune this species and other *Escallonia*s when fairly hard cutting is contemplated. A foot of growth at the top and nine inches to one foot at the side of the hedge may be pruned back the same season, or even more if you consider it desirable. In pruning, cut the long branches back to points where there are side branches, so that no ugly, leafless spurs are apparent. Cover the surfaces of large cuts with Stockholm tar or coal tar.

**SHORT-STEMMED TULIPS.**—**O. C.** When the bulk of the blooms in a batch of forced Tulips have short stems, this is probably due to incorrect treatment, or because the variety is not suitable for early forcing. The trouble is more likely to occur among single varieties than among double ones. Certain double varieties do give a percentage of short-stemmed flowers, and while this may be sometimes due to disease, in others it may be because the bulbs were unduly exposed to the sun and became more or less scorched immediately after lifting. It is very often found under these circumstances that the inner skin of the bulb is brown on one side only, whereas it should be white. In the case of *Couronne d'Or* the base of the bulb is sometimes covered by a hard outer skin, so that the roots are not able to penetrate readily into the soil. In certain instances the outer covering is so hard that the roots endeavour to push up between the first and second scales of the bulbs, and, in consequence, fail to reach the soil. In the first instance the trouble may be prevented by the removal—with the point of a knife—of the hard outer skin from the base of the bulb, and in the second instance by cutting through the skin of the first scale just above the rooting base, before the bulbs are potted or boxed.

REMARKS.—Daffodils and Narcissus have been in excessive supply for some days past. Those arriving from the Channel Islands have been in a very soft condition and

salesmen were pleased to accept any reasonable offer for them; the supplies from Guernsey and Cornwall have been the heaviest so far received this season. There is also a considerable increase in the numbers of Roses, and more sorts are now on sale, including Madame Abel Chateaux and Molly Sharnan Crawford. The prices of Carnations are similar to last week; second grade blooms are difficult to clear. The best sorts marketed are Aviator, Faith Dutton and Spectrum (Scarlet), Cupid, Laddie, Enchantress Supreme, Lady Northcliffe, Mayday, Mrs. Hemus, Eileen Lowe, Lady Boscawen, Winsor, Cerise Peerless, Mrs. Ward, Favourite, Una Wallace and Burnett, (pink); Topsy (crimson), Enchantress and White Wonder (white). Richardias (Arums) may meet with a better demand during the next few days; there should be more demand for them for Palm Sunday and the Easter festivities. Lillium longiflorum is arriving in good condition and the prices remain normal. Sweet Peas show a little improvement in quality, but there is not much demand for these flowers at present. Irises are receiving more attention from buyers, with a gradual improvement in quality; blue white and yellow sorts are being sent by growers in very fine condition. Single Violets are decreasing in quantity, and their prices are firmer. Darwin Tulips are still the most attractive of these flowers, and their prices are similar to those of last week. A few blossoms of Gardenias comprise the newest subject in this department; there are also some very fine blooms of white and pink Ranunculus, also St. Brigid Anemones from Cornwall.

REMARKS.—There has been a better tone throughout the market during the past week. Shipments of fruits from the Cape are moderately heavy and consist of Grapes, Peaches, Pears and Plums. The Grapes were in variable condition, and some holders have been unable to clear them, but on the whole, the South African fruit trade has been good. Apples from the United States and Canada are still available. New Zealand Apples have sold well and the first Australian Apples of the season are due. Some good home-grown fruits of Lane's Prince Albert and Newton Wonder are still being marketed and are meeting a fair demand. Grapes from Belgium are good and selling well, in spite of competition with Grapes from South Africa and Australia. Forced Strawberries are very dear but they are selling well. Prices for Oranges from Spain,

California and Jaffa are inclined to be easier. Larger quantities of Tomatoes are arriving from the Lea Valley and Worthing districts, and prices for Tomatoes are much lower than those that were ruling a week ago. The Cucumber trade is good, and the fairly heavy supplies that are available are selling comparatively well. French Beans are more plentiful and slightly lower in price. Asparagus from France is more abundant every day and is selling at more favourable prices. New Potatoes from Guernsey have sold quite well, but the first consignment of Spanish new Potatoes is a bad omen for the Guernsey produce. Hothouse Peas are a quieter business. Mushrooms are selling well notwithstanding supplies are fairly heavy. Salads from France are not quite so abundant; some good English Lettuces are now available. Green vegetables are a slightly better trade. The conditions of trade in old Potatoes remain about the same as last week.

## GLASGOW.

Following on the spell of mild weather, the daily supplies of Daffodils in the cut flower market were in excess of the demand, and prices dropped to the lowest levels of the season. Golden Spur, princeps and Sir Watkin were sold from 9d. to 1/3 per dozen bunches; Emperor and Victoria for 1/- to 1/6; King Alfred for 2/- to 1/4; ornatus for 1/6 to 2/6; and Primo for 9d. to 1/3. Tulips were also cheap, prices for Clara Butt varying from 4d. to 8d. per bunch; Muriel, 5d. to 8d.; Bardigon, 6d. to 8d.; La Reine and William Saunders, 6d. to 9d.; Prince of Austria, 8d. to 10d.; William Copland, 9d. to 1/-; Lucretia, Van der Neer and Lulsant, 10d. to 1/-; Couronne d'Or, 8d. to 1/-; and White Hawk, 10d. to 1/2. Wedgwood Iris made 3/6 to 4/- per dozen; white Iris, 2/- to 2/3; yellow Iris, 2/-. Carnations, 3/- to 4/- per dozen; red Roses, 2/6 to 5/- per dozen; pink Roses, 6/- to 8/-; Wallflowers, 1/- to 1/6; Violets, 6d.; Anemones, 6d. to 1/-; Lily-of-the-Valley, 2/6 to 3/- per bunch; Lilac, 1/- to 1/3; Richardia, 3/6 to 4/6; and Asparagus, 9d. to 1/6.

Business in the fruit market was very quiet, and prices generally moved in a downward direction. Jaffa Oranges were cheaper at the following values: 240's, one chalk, 21/-; two chalks, 20/-; three chalks, 18/-; 144's and 152's, one chalk, 19/-; two chalks, 17/6; three chalks, 15/-; 136's, one chalk, 17/-; two chalks, 16/-; three chalks, 13/-; 128's, one chalk, 17/-; two chalks, 15/6, and three chalks, 14/6. The price of Sunkist Oranges averaged 27/-; Apples were slow to move. Winesap, ex fancy, were worth 11/- to 13/6 per case; fancy, 9/6 to 12/6. Newtown Pippin, 10/- to 15/-; Baldwin, 16/- to 19/- per barrel; Ben Davis, 19/- to 22/-. Prices for Porto Rico Grape Fruit were steady at 20/- to 22/-. Melons realised 2/- to 2/6 each, and Pine Apples, 7/-. There were large deliveries of fruits from Cape Colony, especially Grapes, which were quoted as follows: Waltham Cross, 8/- to 10/- per tray; Gros Colmar, 10/- to 12/6; red Hanepoot, 7/- to 10/-; and Barbarossa, 10/-. The value of Pears ranged from 5/- to 7/-, and Kelsey Plums, 4/- to 6/-.

New vegetables were plentiful and cheap: Cucumbers sold at 5d. to 8d. each; Lettuces at 1/6 to 3/- per crate; Turnips and Carrots at 6d. to 8d. per bunch; Endive at 3d. and Radishes at 2d. to 3d. Rhubarb realised 30/- to 32/- per cwt. Tenerife Potatoes were worth 16/- per box; Tomatoes, 12/- to 24/- per bundle; and Levant Onions, 9/- to 11/- per bag.

## LAW NOTE.

## MIXED POTATO SEED.

SHERIFF DUDLEY STUART, Cupar, has given judgment for the pursuer in an action raised by James Douglas, Potato Merchant, Falkland, against Colonel Oliver Haig, Ramorine, Falkland, for £30 damages for breach of contract. Pursuer averred that defender's farm manager sold him two tons of Arran Chief seed Potatoes which were guaranteed pure. Defender asserted that he gave no guarantee and that he told pursuer the Potatoes were mixed. A Board of Agriculture inspector said the Potatoes which were planted at Auchterarder were mixed to the extent of fifty per cent.

## GARDENING APPOINTMENT.

Mr. F. S. Hart, previously foreman at The Dell Park, Englefield Green, Surrey, and at Tilstone Lodge, Tarpole, Cheshire, as gardener to ATICK S. AGNEW, Esq., Woodlands, Wilmshurst, Cheshire. (Thanks for 2/6 for R.G.O.F. Box.—EDS.)

## SCHEDULES RECEIVED.

NATIONAL DAHLIA SOCIETY.—Exhibition to be held on Wednesday, September 14, at the Royal Horticultural Hall, Westminster.—Secretary, Mr. W. J. Chittenden, 2, Dents Road, Wandsworth Common, S.W.11.

BLACKPOOL FLOWER SHOW.—First annual exhibition, to be held in Stanley Park, on July 20, 21 and 22.—Secretary, Mr. W. Foster, Town Hall, Blackpool.

TWEKESBURY AND DISTRICT DAFFODIL AND SPRING FLOWER SOCIETY.—Exhibition to be held in the Town Hall, on Thursday, April 14.—Secretary, Mr. J. S. Gannaway, Eastville, Ashchurch Road, Tewkesbury.

WHITLEY AND MONKSEATON CHRYSANTHEMUM SOCIETY.—Fiftieth Chrysanthemum Show, to be held on Friday, and Saturday, November 11 and 12, in the Y.M.C.A. Hall, Whitley Bay.—Secretary, Mr. J. Haley, 22, Countess Avenue, Whitley Bay.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

### SOUTHGATE URBAN DISTRICT COUNCIL.

APPLICATIONS are invited for the post of HEAD GARDENER of Broomfield Park (54 acres, including extensive gardens, greenhouses, two bowling greens, croquet lawn, grass and hard tennis courts, football and cricket pitches, running track, putting green, swimming lake, etc.). The duties will also include supervising the maintenance of the Council's Bowling Green in Grovelands Park.

Wages £3 15s. 0d. per week, with uniform and quarters in house in the Park, but not including heating and lighting.

The person appointed may be required to contribute to the Workmen's Pension Fund under the provisions of the Southgate Urban District Council Act, 1913.

Applicants must be qualified persons, of good health, with practical experience of maintenance of ornamental gardens and bowling greens, supervision of sports grounds, etc., and must not be over 40 years of age. Forms of application will be sent by the undersigned upon receipt of a stamped addressed foolscap envelope, and must be returned, with copies only of three recent testimonials, not later than 18th April next, to

A. E. LAUDER,

Clerk of the Council.

Southgate Town Hall,  
Palmer's Green,  
London, N.13.

WANTED at once, for Berks., SECOND JOURNEYMAN, age 21-25, single, for nursery. Must have glass experience and be quick and reliable. State age, wages, refs.—Q. E. D., Box 37, 5, Tavistock Street, Covent Garden, W.C.2.

# SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

## SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## MUNICIPAL AND PUBLIC.

ADVERTISER, age 38, seeks post as HEAD GARDENER or SUPERINTENDENT of Parks. Life experience in first-class private gardens; ten years as Head.—T. A. B., Box 28, 5, Tavistock Street, Covent Garden, W.C.2.

GOOD Greenhouses last—others do not.

The ROBIN HOOD BOILER  
reduces the fuel bill and saves labour.

*Estimates on application Free.*

## Constructed to stand the most cruel treatment

A Glass House has a hard life! All the year round it is subjected to the ferocious attacks of our variable climate. Scorching sun, sharp gusts of wind, storms of hail and the hard frosts of winter. Each in turn tests the qualities of the Glass House. When you have your Glass House built you would do well to remember the stability that is thus so necessary. See that you get the best, therefore. William Duncan Tucker & Sons Ltd.—admittedly leaders in Glass House creative and repair work for nearly a century—will satisfy the most exacting demands. Their work is sound and accurate and the result most pleasing to the eye. Drop them a line about *your* needs.

**GARDENERS' CHRONICLE, LTD.**,  
5, Tavistock Street, Covent  
Garden, London, W.C.2.

# RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

**T**his fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

**THE GARDENERS' CHRONICLE, LTD.**, 5, Tavistock Street, London, W.C. 2.

## TURF, FIBROUS MOULD and LOAM

Prepared cultivated turf for best lawns, bowling greens, tennis courts, etc.

# CALENDAR OF GARDEN OPERATIONS

Price 2/6, post free 2/10.

The CALENDAR OF GARDEN OPERATIONS is indispensable and unrivalled, because it represents the accumulated experience of over half-a-century. Originally compiled by Sir Joseph Paxton, it has been revised and enlarged by the

staff of The Gardeners' Chronicle until it is now as nearly perfect a gardening guide as any that exists. Its claim to be a "calendar" is undoubted, as the work to be done is arranged under the heading of each month.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47° 3'.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Tuesday, April 12 10 a.m. Bar. 30.4. Temp. 50°. Weather, Fine.

By the death, on March 22, of Professor Charles S. Sargent, head of the Arnold Arboretum and Professor of the Arboricultural Depart-

ment of Harvard University, Massachusetts lost one of her most distinguished citizens, America its leading dendrologist, and the world a great horticulturist. Professor Sargent was eighty-six years of age, and his fatal illness lasted but a fortnight; prior to that time he took an active part in the business of his beloved Arboretum. Born in Boston, graduated from Harvard College, and breveted major at the ending of the Civil War "for faithful and meritorious service," Prof. Sargent identified himself with Harvard College, where he was Professor of Horticulture in 1872 and 1873, and Director of the Botanical Gardens there from 1873 to 1879. On March 29, 1872, Professor Sargent's connection with the Arnold Arboretum began, when the indenture signed by the trustees of James Arnold, a New Bedford merchant, and the president and trustees of Harvard College, gave to

the College for the Arboretum then proposed, an endowment of \$104,000 with which to purchase 125 acres of farm and forest land in Jamaica Plain, the agreement providing that "the Arboretum shall contain as far as is practicable all the trees, shrubs and herbaceous plants, indigenous or exotic which can be raised in the open air" at the site of the institution. The city of Boston and Harvard College agreed to Professor Sargent's suggestion that the City take the Arboretum by right of eminent domain as part of its park system, and immediately the state legislature ratified a special Act turning the property back to Harvard on lease for 1,000 years at a yearly rental of \$1.00, this being in 1882. The site selected for the Arboretum was rolling and romantic, with wonderful cliffs and a splendid remnant of a Coniferous forest. At first meeting with but scant support in the big work he visualised and had undertaken, Professor Sargent gradually enlisted active support for his project as people grew more interested in arboriculture and saw the wonderful developments made. Always deeply interested in forestry, Professor Sargent was selected by the American Association for the Advancement of Science to make a comprehensive study of the forest resources of the country, the first Federal action ever taken on this vital subject. He was chairman of the U.S.A. Commission on Forest Policy which saved great areas in the Catskills and Adirondacks for the state of New York—the real beginning of the National Forests now covering an area of over 150,000,000 acres. He encountered bitter opposition from interested parties in the course of his long and strenuous battles for Forest Conservations, but urged the President to stand firm, which he did. The formation of the great National Parks also was urged by Professor Sargent, and that excellent journal, *Garden and Forest*, which he issued for ten years, was a stalwart champion of forest conservation, and the passing of this magazine is still deplored in America. Professor Sargent had travelled extensively, and many new plants were collected by him personally in Japan, China and other lands; he also sent first-class collectors to divers countries in the search for new material, which greatly enriched American gardens. Always a staunch advocate of the increased planting of more of the beautiful, native American plants, he revolutionised plantings which up till that time had been too heavily of imported subjects, many of them utterly unsuitable and far less satisfactory than American material. It would need a whole catalogue to enumerate the many valuable trees and shrubs introduced to commerce by the instrumentality of Professor Sargent through the Arnold Arboretum. In 1923, he was awarded the Frank N. Meyer Medal for "distinguished services in the field of foreign plant introduction." He was the first recipient of the George R. White Medal of Honor, offered through the Massachusetts Horticultural Society for distinguished services to horticulture. He was also the recipient of the Loder Medal of the Royal Horticultural Society for his work with Rhododendrons, and had received many high awards for exhibits made at the exhibitions of the Massachusetts Horticultural Society. Horticulture has lost a staunch friend in Professor Sargent, who had for a long term of years been an indefatigable worker for the Massachusetts Horticultural Society, Azaleas, Rhododendrons, Wistarias, Clivias, Nerines and tree Paeonies being but a few of the plants he favoured, but everything hardy enough and of merit for the garden was planted and

tried at his beautiful estate, Holm Lea, in Brookline; this estate was annually visited by thousands when the collections of Lilacs, Pyrus, Cornus, Kalmias, Rhododendrons, Azaleas and other hardy subjects were at their best. It is earnestly to be hoped that this lovely estate, so beautifully planted, may be retained, if not as an estate, as a part of Boston's great park system. As an author, Professor Sargent was well-known, and his many works include *A Catalogue of the Forest Trees of North America*, *The Woods of the United States*, *The Forest Flora of Japan*, *Report on the Forests of North America*, *Trees and Shrubs*, *Silva of North America*, and *A Manual of the Trees of North America*. The Arnold Arboretum will serve, if anything were needed, to perpetuate the memory of Professor Sargent, as its 275 acres of rolling land, beautifully planted with what is the greatest collection of trees and shrubs in the Western Hemisphere and, in addition, its matchless herbarium and great library, make it a place to which students in dendrology in the north temperate zone must resort if they desire to master the subject. Many distinguished horticulturists attended the funeral service at Boston on March 25, when his remains were laid to rest in Walnut Hills Cemetery, Brookline, a lovely, restful spot, not far from the scenes of his labours. One son and three daughters survive Professor Sargent; his distinguished son-in-law, Guy Lowell, a noted landscape architect, died so recently as February 4 last, at Madeira, while enjoying a holiday.

**Economic Botany at Kew.**—Mr. Hugh C. Sampson, formerly Director of Agriculture, Madras, has been appointed Economic Botanist at the Royal Botanic Gardens, Kew. The appointment follows the grant to Kew of £4,000 for five years from the Empire Marketing Board. Mr. Sampson will be available either to visit the Dominions and Colonies from time to time, or to set free a superior officer of the Kew staff to undertake overseas missions. Part of the grant will also be devoted to sending botanical collectors to various parts of the world to study and bring home plants of economic importance for cultivation at Kew and distribution to the Dominions and Colonies. Since Mr. Sampson retired from his post in India he has been engaged in carrying out researches in Cotton and other economic products in Nyasaland under the auspices of the Empire Cotton-growing Association.

**Honour for Sir Frederick Keeble.**—Under Rule 11, which empowers the annual election by the Committee of persons of distinguished eminence in science, literature, the arts, or for public service, our colleague, Sir Frederick William Keeble, formerly Sherardian Professor of Botany at Oxford University, and previously Director of Wisley Gardens, has been made a member of The Athenaeum.

**Legacy to a Gardener.**—The Rev. Algernon H. Cochran, of Merry Hall, Ashted, Surrey, who died on February 15, left a legacy of £182 to his gardener, Mr. A. E. Newby.

**Lapponicum Rhododendrons flowering at Kew.**—Horticulturists proposing to visit Kew during Eastertide may be glad to know that many of the interesting 'Lapponicum' Rhododendrons are now in flower on the rock garden and by King William's Temple. Taking the 'Lapponicum' series generally there is probably no other group, with the exception of the 'Triflorums,' which gives such first-rate garden value. They are small, compact, and brightly floriferous. In mass, they are most effective, and their foliage, which is generally aromatic, is pleasant. They usually flower in their third year, and in five or six years form stout little bushlets or low, rounded cushions, smooth.

ered beneath a foam of charmingly-coloured blossom—lavender, violet, purple, rose-pink or yellow, in varying tints. The tussocky habit is one to encourage so far as possible. Species now in flower include the following:—*R. flavidum*, with lemon-yellow flowers on twiggy growths, two to three feet high; *R. hippophaeoides*, lavender flowers on bushlets, three to four feet high,—there is also a form from which the blue pigment is lacking, with rosy-pink flowers; *R. scintillans* (this is practically *R. hippophaeoides*); *R. impeditum*, a much dwarfier, hassock-forming species, also with lavender flowers,—the fallacy, however, of describing any of these as blue may be realised by comparing them with a really blue flower, such as a *Gentian* or *Muscari*; *R. orthocladum*, a beautiful, rounded undershrub, crammed with pale lavender flowers; *R. cantabile*, with almost violet flowers; *R. osmerum*, with dark-coloured flowers, which might be called lavender-purple; and *R. lysolepis*, one of the brightest of the purple-flowered species, abounding in blossom. The largest shoots of the last have been killed back, but far from spoiling the plants, this seems to have given them more substance and a sturdier bushiness. No doubt all the above-mentioned species are good on their day, but the pick just now are undoubtedly *R. impeditum*, *R. orthocladum*, *R. cantabile* and *R. lysolepis*.

#### Amount of Tithe Rentcharge in 1926.—

The total amount of tithe rentcharge charged on lands in England and Wales by the Tithe Act, 1836, and the amending Acts, was, according to the *Journal* of the Ministry of Agriculture, £4,054,405. It is estimated that, by the end of the year 1926, this sum had been reduced by redemption, merger and other means to about £3,249,000. There are no available statistics showing exactly what portion of this estimated sum of £3,249,000 was payable to incumbents of benefices, but the amount was probably about £1,889,000. It may further be estimated that about £273,000 was owned by the Ecclesiastical Commissioners, £96,000 belonged to ecclesiastical corporations, and £209,000 was owned by the Welsh Church Commissioners, the balance of £782,000 being held by various schools, colleges, charities and individual lay owners.

**Paris Spring Show.**—The programme of the International Horticultural Exhibition, to be held in Paris from May 25 to June 3, is now to hand, and it would appear that it is likely to be well supplied with important exhibits and to attract large numbers of interested visitors. The exhibition will be formally opened at 11 a.m. on the 25th, after which, at 12.30, the judges will lunch at the headquarters of the Society in the Rue de Grenelle. At 4 p.m., the Horticultural Congress will open at the same place. On Thursday, May 26, there will be an excursion to Versailles, comprising visits to nurseries and to the Versailles Horticultural College, as well as to the park, etc. On Friday, the 27th, the second session of the Congress will begin at the early hour of 8.30 a.m. At 2 p.m., a visit will be made to the National Natural History Museum, and at 5 p.m. a reception at the Hôtel de Ville will take place. On Saturday, there will be an excursion to Bourg-la-Reine, Châtenay, and Verrières-le-Buisson with déjeuner at Sceaux-Robinson; at 9 p.m., a reception will take place at the Society's headquarters, Rue de Grenelle.

**Barr Memorial Daffodil Cup.**—On the occasion of the London Daffodil show, the members of the Royal Horticultural Society's Daffodil and Tulip Committee award the Barr Memorial Daffodil Cup—which commemorates the late Mr. Peter Barr—to someone who has done good work on behalf of Daffodils. The cup is held for one year only, and was awarded on April 12 to Mr. J. T. White, of Spalding, a pioneer of the cultivation of Daffodils for market, and now eighty years of age. A portrait and appreciation of Mr. J. T. White were given in our issue of April 4, 1925. The Barr Memorial Cup has been held previously by the Rev. G. H. Engleheart, 1912; Mr. Peter R. Barr, 1913; Mr. E. M. Crossfield, 1914;

Mr. P. D. Williams, 1915; Mrs. R. O. Backhouse, 1916; Mr. Walter T. Ware, 1917; Miss Ellen Willmott, 1918; Rev. J. Jacob, 1919; Mr. J. Duncan Pearson, 1920; Mr. Alex. M. Wilson, 1921; Mr. W. F. M. Copeland, 1922; Mr. Charles H. Curtis, 1923; Mr. J. K. Ramsbottom, 1924; Mr. F. Herbert Chapman, 1925; and Mr. W. Poupert, 1926.

**Mr. A. F. Dutton.**—The winning of the *Daily Mail* Cup for the best scented Carnation has again brought Mr. A. F. Dutton into prominence. Between twenty and twenty-five years ago Mr. Dutton was a frequent and successful exhibitor of Carnations, but in more recent years his exhibits have been few and far between, as his attention has been devoted largely to the production of cut flowers for market. He commenced business as a grower at Bexley Heath, but after a dozen years or so, he took up land at Iver, Buckinghamshire, where he has been established about twenty-five years. At Iver there are eight acres of Carnations, and thirty-two acres of hardy plants, all grown for cut flowers for market. For four years Mr. Dutton has tested his new crimson Carnation, named Mrs. A. J. Cobb, and in all

MR. A. F. DUTTON.

probability he would never have distributed plants of it, but for the recent competition which excited his interest, otherwise the variety would have been grown only for market. Having already described and illustrated his fine new Carnation, there is no need to use further adjectives in its favour. It is bound to become popular. Mr. A. F. Dutton attends to the cultivation of Carnations, Chrysanthemums, etc., at Iver, while Mr. Arthur Dutton acts as salesman, both in Covent Garden Market proper and at the Tavistock Street warehouse, where he sells the flowers grown by his brother. Since winning the Cup the award of the First Class Certificate of the British Carnation Society has been made to Mr. Dutton's new variety, after an inspection of the plants by the B. C. S. Floral Committee at Iver.

**Royal Commission on Land Drainage.**—The King has been pleased to appoint a Royal Commission on Land Drainage with the following Terms of Reference:—"To inquire into the present law relating to land drainage in England and Wales and its administration throughout the country, to consider and report whether any amendment of the law is needed to secure an efficient system of arterial drainage without undue burdens being placed on any particular section of the community, and to make recommendations having regard to all the interests concerned." The members of the Commission will be as follow:—The Rt. Hon. Lord Bledisloe,

K.B.E. (Chairman); The Lord Clinton, Lt.-Col. Sir George Courthope, Bt., M.P., Lt.-Col. F. D. W. Drummond, C.B.E., Sir George Etherington, Mr. Leopold Harvey, Major J. W. Hills, M.P., Mr. H. A. Learoyd, M.A., LL.B., Sir Joseph Priestley, K.C., Sir Albert Pritchard, Mr. Rowland R. Robins, C.B.E., and Mr. Walter R. Smith, with Mr. H. Meadows and Mr. D. B. Toye, O.B.E., as Joint Secretaries, and the Hon. Arthur Peel, Assistant Secretary (unpaid). Since the war, especially as a result of the impetus afforded by the Land Drainage Act, 1918, there have arisen in various drainage districts, all over England and Wales, difficulties of great and increasing magnitude. The main cause of this is probably to be found in the fact that the drainage legislation of this country, which is largely based on a Statute of Henry VIII, is inadequate and unworkable in the light of modern conditions. The Government have therefore come to the conclusion that the whole of the present drainage law requires to be closely examined with a view to possible alteration, and it is with this object in view that the Royal Commission has been appointed. All communications relating to the Royal Commission should be addressed to the Joint Secretaries to the Royal Commission on Land Drainage, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W. 1.

**Classified List of Daffodil Names.**—The new *Classified List of Daffodil Names* (1927) brought up to date, is now available for those who specialise in Daffodils, and obtainable from the Royal Horticultural Society for one shilling per copy. In the first *List of Daffodil Names* published, the varieties were not classified, but in 1906 a larger list was issued, and the varieties classified; this method of classification, however, failed to meet with general acceptance and numerous modifications were suggested, consequently the R.H.S. Council re-appointed the Classification Committee in 1909, with the result that the present system was put forward and authorised. Since then some sub-divisions have been added, as in the Leedsii and Triandrus groups. In the new issue there are, in round figures, 2,800 Daffodils named in bold type, each one classified, and if it has gained an Award of Merit, the date of such award is given. It is assumed that all these varieties are in cultivation and useful either for garden or show purposes; but there is another list, occupying forty pages at the end of the booklet, containing well over two thousand names of varieties, either lost to cultivation or surpassed by modern varieties. Altogether about five thousand names are listed!

**Capsid Bug in the Wisbech District.**—Growers in the Wisbech district are experiencing severe trouble with attacks of Capsid Bugs on Apple trees, and the severity of the infestation is attributed to the large number of Willows which are found in the Wisbech neighbourhood, the Willow being one of the hosts of the pest. It is found that the Capsid bugs are most severe in their attacks on Apple trees with soft, quickly-growing shoots; the large amount of water in the alluvial soil of the Wisbech district is said to be favourable to the development of such growth.

**Post Office Concession to Covent Garden Market.**—The Postmaster-General, having been asked to install a telegraph office in Covent Garden Market, states that he is willing to allow the Strand, Southampton Street, Branch Post Office to be opened at 7 a.m. instead of 8 a.m. on week-days, from April 1 to September 30 next for the acceptance of telegrams and for the sale of postage stamps. The innovation will be in the nature of an experiment, and the matter will be reviewed at the end of September in order to see whether the amount of business transacted at the earlier hour justifies making the arrangement permanent during the summer months.

**Dr. A. Ragionieri.**—The fifty-years' jubilee is being celebrated this year by horticulturists of the first hybrid raised—in 1876—by the veteran horticultural botanist, Dr. Attilio Ragionieri. The name of this hybrid is *Dieffenbachia Memoria Corsi*, a cross between *D. Seguine picta* and *D. Wallisii*. Born at Sesto

Florentina, near Florence, in 1856, this indefatigable Italian botanist has raised hybrids in many different families of plants, including Richardias; he is, perhaps, best known for his work amongst Freesias and Ranunculuses. A portrait and appreciation of Dr. Ragnieri appeared in *The Gardeners' Chronicle* of April 19, 1924.

#### Honour for Belgian Horticultural Official.—

We are pleased to record that M. Hector van Orshoven, the Director of Horticulture in the Belgian Ministry of Agriculture, has been made an Officer of the Order of Orange-Nassau. Our congratulations are the warmer as we do not forget the valuable assistance rendered to *The Gardeners' Chronicle* during the war by M. van Orshoven, who for many months edited a page written in French and Flemish by which this paper was enabled to get into touch with the many Belgian refugees who fled to our country in the early days of the German invasion.

**Pimpernels.**—At a recent meeting of the Linnean Society Miss Eleanor Vachell gave an interesting account of an unusual *Anagallis*, found in a newly-constituted public park at Coldknap, Barry, in July, 1926. The plant was growing in a border amongst a large colony of normal plants of *Anagallis arvensis*; it had eleven stems, seven bearing scarlet flowers, and four bearing blue flowers. Two types, *A. arvensis*, Linn., and *A. foemina*, Mill., were apparently represented on the same plant, i.e.,—Seven stems: Corolla-segments scarlet, edge even, fringed with numerous glandular hairs, calyx two-thirds as long as corolla. Four stems: Corolla-segments blue, edge denticulate, with very few glandular hairs, calyx as long as corolla. The root appeared normal, no fusion of two roots being visible. The interest of the specimen is that the characteristic features of two species (as usually recognised) are represented, but remain distinct. No parti-coloured flowers suggested hybrid origin: it appears rather that one portion of the plant may have reverted. The capsules on the seven stems bearing scarlet flowers were considerably in advance of those on the four stems bearing blue flowers. Dr. Rendle read the following letter from the Rev. Canon F. W. Galpin on the subject of Miss Vachell's paper:—"With reference to Miss Vachell's interesting exhibit, I should like to state that, in the year 1924, a great quantity of *Anagallis foemina*, together with an abundance of the common *A. arvensis*, was growing in a field near Rivenhall Place, Witham. My neighbour, Mrs. Bradhurst, who lives at The Place, and is a good field-botanist, observed a plant on which three stems bore red flowers and one stem blue. She transferred the plant to her garden, as the field was shortly coming under cultivation again; there I saw it, but unfortunately all the flowers had dropped. I am glad, however, that her find, which was somewhat doubted at the time, has now received ample corroboration. I may add that, after a prolonged search, I failed to find any similar specimen; nor did I observe any parti-coloured hybridization between the two types." In the discussion which followed, Dr. Stapf suggested that Miss Vachell's plant was an instance of somatic segregation, and that these two species should be subjected to genetic experiment, which might throw much light on the problem of our smaller, wild Pimpernels.

**Honour for M. Louis Gentil.**—We are gratified to learn that M. Louis Gentil, Curator of the Brussels Botanic Garden and Editor of our contemporary, *La Tribune Horticole*, has been made an Officer of the French Order of L'Instruction Publique. Many of our readers will remember that during five years of his stay in London, M. Gentil acted as Secretary of the now defunct Société Française d'Horticulture de Londres.

**Sweet Pea Exhibition in Brussels.**—From June 25 to 27 this year, an exhibition of Sweet Peas will take place in the Botanic Gardens in Brussels. This will be the first occasion on which entries are invited from foreign, as well as Belgian, growers. The schedule may be obtained from

the Secretary of the Sweet Pea Society, 31, Rue de la Démocratie, Anderlecht, Brussels. Both amateurs and professional growers are invited to compete, and many valuable cups and other prizes are being offered.

**Appointments for the Ensuing Week.**—TUESDAY, APRIL 19: Winchester Horticultural Society's meeting. WEDNESDAY, APRIL 20: Herefordshire Spring Flower Show; Royal Gardeners' Orphan Fund meeting. THURSDAY, APRIL 21: North of England Horticultural Society's show (two days); Midland Daffodil Society's show (two days). FRIDAY, APRIL 22: National Rose Society's show; Manchester and North of England Orchid Society's meeting.

forests and jungles of Guatemala, others from the cold table land of Rachiquel, where they are actually gathered in a snow storm; twelve hundred square miles of country are said to have been ransacked by Indians in search of materials for this Orchid sale. In all respects the lots are of a very interesting description; and even if a man is not a buyer, still we would have him visit the collection, so that he may see how Orchids grow at home; what masses of entangled roots, dead sticks and leaves afford them sustenance; what swarms of Ferns and other plants crawl among them, what layers upon layers of the most humid but not wet, most rich but not stimulating, most cool but not cold, most rotable but not rotten, matters

FIG. 129.—AURICULA DUCHESS OF YORK.

R.H.S. Award of Merit, April 5. Flowers plum-purple and soft yellow. Shown by Mr. James Douglas (see p. 255.)

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Orchids for the Million.*—The beginners in Orchid-growing have now an opportunity of buying cheap the materials of their apprenticeship. The million, as our friend "Dodman" calls them, have a great chance; for shillings they may procure what, under other circumstances, might cost them pounds. Seven or eight-and-twenty chests of *Laelias*, *Chysids*, *Lycastes*, *Barkerias*, *Cattleyas*, *Arpophylls*; *Epidendrum Skinneri*, *Stamfordium* and *bicornutum*; *Oncidium leucochilum*, *Odontoglossum pulchellum*, and all the *élite* of Guatemalan epiphytes come to the hammer at Stevens's on Tuesday next. The lots consist of huge masses of rarities, or of what is better, first-class ornamental species, any one of which would stock a house for ever. Some are from the

they delight in; and how, as they themselves decay, they furnish pabulum, on which they also feed and flourish by devouring their own substance. All these things the Orchid-grower may see and largely profit by, has he but skill to interpret the universal language in which nature speaks to those who can decipher the living characters in which her operations are emblazoned in woods and fields and on rocks and mountain tops. *Gard. Chron.*, April 17, 1852.

**Publications Received.**—*Magnolias*, by J. G. Millais, Illustrated; Longmans, Green and Co., Ltd., 39, Paternoster Row, E.C.4; price 32/- net.—*Vegetable Gardening*, by A. J. Macself, Thornton Butterworth, Ltd., 15, Bedford Street, W.C.2; price 6/- net.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Blotchley Park, Blotchley, Bucks.

**Catesetum, Cynoches and Mormodes.**—These quaint and interesting Orchids all succeed under similar conditions, both as regards temperature and rooting material. The plants are commencing to grow after their long rest during the winter, and should receive water at the roots at intervals to prevent the pseudo-bulbs from shrivelling. They need repotting each year, and this is best done when the new growths are developing roots from their bases. Shake all the old compost from the plants, cut away all decayed portions and dead roots, and remove all useless back pseudo-bulbs. Somewhat deep pans, which can be suspended, are the most suitable receptacles, and they should be well drained with clean crocks.

**Compost.**—A suitable rooting-medium for these Orchids consists of a mixture of Osmunda, peat fibre, and Sphagnum-moss, cut into rather fine portions, thoroughly mixed together and warmed before being used. Employ pans of a suitable size, but guard against over-potting, as all these plants resent too much material about their roots. Place the compost firmly around the bases of the pseudo-bulbs. After repotting, water should be applied with extreme care until the roots and young growths are developing freely, as the latter are liable to decay if the compost becomes too wet when they are in a young state. When the young growths are well-rooted and roots plentiful, liberal supplies of water will be necessary until the season's growth is completed. During the early stages of growth, slight shading is necessary but later the plants may receive more direct sunshine.

**Temperatures of the Houses.**—The weather in April is often very changeable; periods of sunshine and shade, heat and cold, render it almost impossible to maintain the temperatures of the different houses at a normal level, but much may be done by a judicious use of the blinds and ventilators, even in the most exposed districts, to minimise the fluctuation of temperature. As the weather improves the temperatures of all the houses may be gradually increased, more atmospheric moisture promoted, and the general conditions made more conducive to growth.

### THE KITCHEN GARDEN.

By E. H. CROOKFORD, Gardener to THE RT. HON. LORD  
WYRETHORPE, Horsley Hall, Grafton, N. Wales.

**Globe Artichokes.**—Remove all litter and weeds from these plants and apply a liberal dressing of well-rotted manure, which should be lightly forked into the soil. Later, when the plants are growing freely, copious soakings of liquid manure should be given the roots on frequent occasions. This stimulant will prove of great assistance in helping to produce very fine heads of this highly esteemed vegetable. In making fresh plantations of this vegetable, set out strong plants about four feet apart on deeply-trenched, heavily manured ground.

**Brassicas.**—About this date is a good time for sowing seeds to provide the main crops of winter and spring Broccoli, late Kales, Cabbages and Savoyas. Sow thinly and protect the seeds from birds.

**Herb Border.**—The herb border should be examined and any weak subjects renewed at once. Prepare a fresh site on which to plant herbs which are being raised under glass.

**Seakale Beet.**—This useful vegetable should now be sown in well-manured ground. The

leaves of this plant are a good substitute for Spinach, and the thick, succulent stems may be blanched and used as Seakale. Seakale Beet is hardy, does not readily run to seed, and may be relied on to give a constant supply of leaves throughout the season.

**Onions.**—Strong plants growing in boxes may be planted in the open after they have been hardened thoroughly. The ground having been well-trenched and manured previously, should now be dressed with a liberal amount of burnt refuse and fair quantities of bone-meal and soot, all of which should be either forked or well-raked in the soil. Make the surface firm by treading, and again rake it to promote a good tilth. Choose a warm day for setting out the young plants, which should be lifted carefully from the boxes with a trowel in order to disturb the roots so little as possible. Plant very firmly, and do not bury the stem deeply. Should the weather be dry at the time of planting, water the plants and damp the foliage during the afternoons of very warm days. Allow a distance of not less than fifteen inches between the rows and twelve inches between the plants. If the latter are required for exhibition allow eighteen inches between the rows. Should the bed be a large one, allow a space of two feet between every four rows to enable the necessary attention to the plants to be given without stepping amongst them. Keep the foliage lightly dusted with old soot as a deterrent to Onion-fly. An occasional spraying with paraffin emulsion will also help to ward off this pest. Free use should be made of the Dutch hoe (once a week, if possible) as stirring the soil will do much to promote healthy growth.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NAIL-CAIN,  
Brocket Hall, Hertfordshire.

**Lachenalias.**—These useful plants should receive every attention during the next few weeks. After Lachenalias have flowered they are often stood in some odd corner or under the stage, but if the plants are to be grown and flowered to perfection they must receive every attention until such time as the growths turn yellow and gradually die down, after which they should be placed on a shelf fully exposed to the sun, and be allowed to rest until they are repotted in August. Freesias need the same treatment.

**Souvenir de la Malmaison Carnations.**—Two-year-old plants of Souvenir de la Malmaisons that were shifted into eight-inch pots to produce a wealth of bloom, have filled their receptacles with roots and will be sending up their flower stems. If the plants are not too vigorous, they may be fed with Carnation manure, or soot-water, which will provide a good change of plant food. These Carnations resent over-feeding and, given excessive supplies of organic manures, the flowers are inclined to produce hard centres. When the plants are fed judiciously, the flowers show a marked improvement, both in quality and colour. Layers rooted last season, that are growing in four-and-a-half inch or six-inch pots, require much the same treatment with regard to feeding, but here again, I would strongly advise the grower to err on the weak side, otherwise the flowers will probably show signs of coarseness. Support the growths with neat stakes to prevent damage to the flower-stems, and disbud the flowers at the earliest opportunity. Greenfly is very partial to Malmaison Carnations, and should never be allowed to infest the plants; light fumigations will keep these pests in check. The house in which the plants are growing should be ventilated freely on all favourable occasions, and very little warmth from the hot-water-pipes will be necessary now, except on very cold nights, for these Carnations resent an arid atmosphere at all stages of their growth.

**Cyclamens.**—Plants raised from seeds sown last August and potted on into small receptacles as previously advised, should now be ready for transferring to three-and-a-half-inch pots. The compost for this potting may consist of

equal parts of fibrous loam and leaf-mould, with a liberal dash of silver sand and old bricks broken very small to ensure a free passage of water. Cyclamens delight in plenty of moisture at the roots, but at the same time they dislike anything approaching stagnation. After potting them they should be stood on a moist base in a fairly cool house near the roof-glass and shaded from bright sunshine. Keep a sharp watch for mite and aphid; the former pest may be checked by fumigating the plants with sulphur, and the latter by the use of a nicotine insecticide.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Figs in Borders.**—Trained Fig trees in successional houses will now require constant attention in thinning, stopping and tying the shoots. The extension system of training is the simplest of all methods of growing good Figs, where space admits. As the roots of the trees are growing in restricted borders, the development of surface roots should be encouraged by applying light mulchings of rich manure, and feeding them with weak liquid manure, soot-water or guano water on alternate waterings. Air should be admitted when the temperature rises to 70°, and the temperature may be allowed to rise gradually to 80° before closing the house early in the day with plenty of sun-heat and atmospheric moisture.

**Late Figs.**—The latest Fig houses should be kept cool, dry and well-ventilated until the buds at the ends of the shoots begin to start into growth. If, however, fire-heat is available, there will be no necessity to delay forcing, for early growth may be protected from injury by late frosts. If fire-heat is not available, close the house early in the afternoons, make the fullest use of sun-heat, and syringe the trees on the mornings of fine days only.

**Early Melons.**—The earliest fruits will soon require to be supported, and for this purpose nets are the safest to use, for when square boards are requisitioned there is a liability of them being upset when being touched by any object, and a sudden knock often detaches the fruit from the stalk. The night temperature of the house may range from 68° to 73°, admitting a little air at night whenever the weather is fine. Attend to top-dressing and feeding of the roots, especially of plants growing in pots. Stop the shoots of successional plants after the requisite number of fruits has set; for these successional plants a night temperature of 65° to 68° will be sufficient. Be sparing in the application of water and liquid stimulants at this early stage, for an excess of moisture is conducive to weak foliage, which is readily injured by hot sunshine.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Bamboos.**—The various members of the Bamboo family may be transplanted now. In gardens generally, there are many situations where Bamboos could be planted with excellent effect, but always select a sheltered position, as cold, cutting winds are the chief cause of failure with these plants.

**Canterbury Bells.**—Where good specimens are required for autumn-planting, a stock of Canterbury Bells should now be raised from seeds sown in a cold frame. When of a suitable size to handle, the seedlings should be pricked off a few inches apart, in seed boxes. When large enough and hardened off, they should be planted out in the reserve garden. In the immediate neighbourhood of London very large plants will not withstand the winter unless they are potted and grown in cold frames; they do not winter well also in damp, cold districts. In these circumstances, growers in unfavourable

districts should defer sowing until next month and be content with smaller plants.

**Campanula pyramidalis and variety alba.**—Chimney Campanulas are excellent plants for furnishing lawn beds or for grouping in the mixed border. Where it is desired to grow these plants for bedding purposes, seeds should be sown next month. Young plants raised from seeds sown last year and wintered in boxes should now be planted out in the nursery garden, where they should make fine specimens for putting in the open in the autumn.

**Forcing Bulbs.**—Bulbs that have been grown in pots for conservatory decoration are often thrown away, yet many of them, especially Narcissi, may be successfully naturalised in grass, or they may be planted out in the nursery and grown on for a season or two. It is not necessary, nor indeed desirable, to dry them off; they may be merely turned out of their pots, the soil shaken from the roots and planted forthwith, either in the grass or in the nursery garden. The florists' varieties of Hyacinths are also excellent for naturalising in grass, where they will come up for many years in situations that suit Narcissi. The plants usually develop several small inflorescences instead of one large one, and this renders them more suitable for this particular purpose. It has been for many years our practice at Kew to turn the plants out of their pots when they have finished flowering and plant them out in grassy places, the essentials for success being a soft, spongy turf.

**Eranthis hyemalis.**—The Winter Aconite is a charming subject for under-planting large beds of shrubs or naturalising in open, woody places. In suitable conditions it establishes itself and increases freely in grass. If possible, the plants should be lifted, divided and replanted just before the foliage dies down.

#### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Peach and Nectarine Trees.**—So soon as the young growths are sufficiently advanced, dis-budding should be commenced and carried on at intervals throughout the season. It is prudent not to thin too severely at first, but remove just so many shoots as will not cause a check to the trees and the fruits that have just formed. In doing this work retain one good shoot at the base of each of last season's fruiting growths and on the upper side. This new shoot will furnish fruits next year and take the place of the older one when it is removed. When dis-budding the trees for the first time, rub off all foreright shoots and a few others at intervals along the current season's fruiting wood. After an interval of ten or twelve days, if the weather is warm and favourable to rapid growth, more shoots that are not wanted should be removed, and the work should be continued from time to time until only sufficient required for furnishing the space are left. So soon as the fruits are well set and well on the move, watch for aphid, and if the pest is detected, syringe the trees on a few occasions with clear water, after which wash the foliage with XL All insecticide, using it at a weak strength at this early stage. See that every part of the leaves are washed thoroughly so that the new growth is not checked.

**Birds and Fruit Buds.**—Fruit trees are all showing well for bloom, and if the weather proves favourable there should be heavy crops of fruit. Keep a watchful eye on birds in the fruit garden. Sparrows are, as a rule, very troublesome and destructive to the flowers of the Pear, Apple, Sweet Cherry and Plum when they are about to expand. It is frequently necessary to protect wall trees with netting to save the crop. Syringing with soap-suds and Quassia extract, followed by a liberal dusting with soot, lime and wood-ash, will help to keep birds in check. Bullfinches and tits do much harm to Plums, Damsons, etc., and should be checked.

#### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Perpetual Carnations.**—All young plants rooted early in the year are ready for transferring to larger pots, and this should be done before they become pot-bound. Four-inch receptacles are suitable for this potting. The compost should consist of good loam mixed with a small quantity of leaf-mould and sand, with a dusting of soot. The plants should henceforth be grown in quite cool conditions, and when they are established in their new pots the leading shoot should be removed by pinching or jerking it right out, at a suitable joint, to favour the development of numerous side-shoots. Older plants which have been flowering all the winter will now require attention, and should be given a top-dressing of some suitable Carnation manure, at intervals, according to the conditions of the plants. All side-shoots on the flower stems should be pinched out. The plants should be

Camellia, Carpentaria, Ceanothus, Choisya, Clethra and Colletia, as well as choicer subjects, such as Lomatia, Embotrium, Hoheria and Tricuspidaria. The evergreen species of Olearia, Escallonia and Berberis provide us with many outstanding free-flowering and fine-foliaged subjects.

**Cyclamens.**—These plants are now passing out of flower and should be rested for a few months by gradually reducing the supply of water and standing them in a sunny place to thoroughly ripen the corms. Old plants which have passed their useful stage may be discarded, and the younger ones ripened carefully, so that when they are required to be repotted in July they will be in a suitable condition. Too often one sees Cyclamens lying under the plant stages, or otherwise totally neglected during the summer, and it is no wonder that plants treated in this manner fail. Two-year-old corms produce a wealth of foliage and flowers

FIG. 130.—CYMBIDIUM PAUWELSII, ANKERSMIT'S VAR.

R.H.S. First-Class Certificate, April 5. Flowers greenish-yellow, pink, bronze, cream and brown.

Shown by Messrs. Cowan and Co. (see p. 255).

kept erect by means of stakes or other supports, in order to obtain long, straight stems. Ventilate the house freely, and keep a close watch for the first sign of green-fly, which should be eradicated at once.

**Planting Evergreen Shrubs.**—Evergreen shrubs should now be planted, and where large specimens have to be shifted, it is understood that these have been prepared for removal by cutting a trench around them about twelve months in advance, and severing all thong-like roots encountered. This preparation enables the plants to develop numerous young roots in a compact ball of soil so that they will transplant successfully. Young shrubs which have been transplanted while in the nursery at regular intervals, will present no difficulties in moving them, and choicer ones grown in pots may be planted at almost any time. In the milder districts, there is an almost bewildering choice of evergreen shrubs which may be grown successfully, such as Arbutus, Andromeda, Aristotelia, Azara, Benthania, Callistemon,

from November to April. Seedlings sown last July should now be filling their first small pots with roots and may be shifted into five-inch pots, using, as compost, equal parts of turfy loam and flaky leaf-mould, mixed with a small quantity of dried cow-manure and sufficient sand to render the compost porous. These seedlings should not be rested the first year, but kept growing actively in a partially-shaded house or frame, and syringed freely in order to keep them free from insect pests.

**Asparagus.**—Asparagus plants are now sending up succulent shoots, and if not already applied, a liberal dressing of agricultural salt should be given, preferably during showery weather. This dressing acts not only as a stimulant to the young growth, but also as a deterrent to slugs; a dressing of sulphate of ammonia may be applied later when the crop is further advanced. All usable shoots should be cut at regular intervals, and if not required for immediate use, tied into bundles and stood in shallow trays in water.

## INDOOR PLANTS.

### BEGONIA MANICATA.

THIS Begonia is in bloom from the New Year until well into April, and is the finest of the winter-flowering species; indeed, it rivals from a decorative point of view even the best of the hybrid Begonias. It is not suitable for cultivating on a large scale for market purposes in the same manner as Begonia Gloire de Lorraine and its varieties, because its habit does not render it suitable for packing and travelling, but for conservatory and greenhouse decoration in private establishments it is ideal, and it is also extremely useful for indoor decoration.

Unfortunately, the species does not appear to be well-known, but it is certainly worthy of more extended cultivation.

April or May is a suitable time to insert cuttings, and year-old plants make specimens a foot or more in height, with large, spreading leaves. The individual flowers are rather small, and of a beautiful pale pink colour; they are dipetalous and borne very freely in loose panicles on peduncles two feet or more in length. The whole effect of the plant is decidedly graceful and it remains in good condition for a long period.

Plants potted on and grown a second year make wonderfully fine specimens and they develop much finer trusses of bloom than one-year-old stock. Plants of this description are very useful for furnishing the beds in the conservatory.

### STROBILANTHES DYERIANUS.

THIS stove or intermediate-house Acanthaceous plant is generally grown for its beautiful leaves, which are extremely attractive, especially when young. They are shaded with pink, and in addition, possess a violet, metallic lustre such as is not frequently met with in foliage plants. *Strobilanthes Dyerianus* is also worth growing as a flowering plant. The lilac, tubular flowers are marbled with purple and borne in a terminal spike. *T. H. Everett.*

## TREES AND SHRUBS.

### RHODODENDRON ARGYROPHYLLUM.

DISCOVERED by David, and first described by Franchet in 1886, this variable species (see Fig. 133), was introduced by Mr. E. H. Wilson, who found it in 1904, when collecting for Messrs. James Veitch and Sons. It is quite a common species in Szechuan at altitudes of from 6,500 to 11,500 feet. Although the usual colour of the flowers is pale pink, there are numerous forms, some with deeper colouring, some bluish white and others pink with white spots. Rehder and Wilson (*Plantae Wilsonianae*) record two distinct varieties i.e., *R. argyrophyllum cupulare* and *R. a. omeiense*, the former having a broadly campanulate or cup-shaped corolla and the latter differing from the type in having a dun-coloured tomentum on the undersides of the leaves instead of the usual white or silvery tomentum.

*R. argyrophyllum* is evergreen and grows from six feet to twenty feet high, but in this country it grows slowly, although it is quite hardy. The broadly campanulate flowers are one-and-a-half-inch wide and borne in loose trusses of from six to eight.

### CERCIDIPHYLLUM JAPONICUM.

IN early April, this shrub is very lovely, more especially in bright sunlight, when the shell-pink suffusion in the colouring of the delicate young leaves gives a well-grown specimen a charming appearance. In the autumn the heart-shaped leaves of fine texture turn a brilliant and arresting red, a flamboyant beauty in direct contrast to the delicate loveliness they assume in spring.

The plant is quite hardy and grows freely and easily in almost any soil, in an open situation; if any preference is noticeable, it is for a rich

deep, loam. *C. japonicum* is certainly one of the treasures of the spring and autumn garden, and is easily propagated by cuttings of half-ripened wood inserted in the summer. *A.*

### POTENTILLA FRUTICOSA.

OF the shrubby species of *Potentilla*, the subject of this note is the best, and is well worth growing on account of its late season of blooming, which lasts from June onwards for two months or more.

It is a native of many parts of the Northern Hemisphere, and is found wild in certain parts of northern Britain and Ireland. It forms a dense bush, from two to three feet high, and is very effective when in bloom. The deep yellow flowers are an inch or more in diameter, and are produced with great freedom.

The plant is useful for grouping in the shrubbery, or in beds on the outlying portions of the lawn. It succeeds well in good, loamy soil, and is readily propagated by means of seeds.

### ALNUS OREGONA.

LARGE numbers of hardy Alders bloom early in the year, but none is more beautiful than the Oregon Alder in late February or March, when it produces its handsome male catkins from the tips of slender shoots.

The catkins are borne in bunches of from three to five, and are from four inches to six inches in length.

*Alnus oregona* attains a height of forty to fifty feet in this country when fully grown, and succeeds best when planted in a deep, rich, moist loam. *T.*

## FLOWER GARDEN.

### ARCTOTIS SCAPIGERA.

SEEDS of this plant, which received the R.H.S. Award of Merit on April 5, were received from South Africa in February, 1926, under the name of *A. acaulis*; they germinated readily in a warm house, and many of the seedlings were in full flower in July.

On plants being sent to Kew it was pointed out that it was something quite distinct from the *A. acaulis* as known there, which was always found to bear yellow flowers only. Whatever name this fine and showy *Arctotis* may eventually bear, there is no question about its merits as a greenhouse or summer bedding plant.

A batch of about one hundred year-old plants shows great diversity, both in flower and foliage, the blooms varying from rich red to the most brilliant orange; some bear blossoms four inches in diameter, others smaller, but none the less striking and showy.

The great merit of the plant is the ease with which it may be cultivated; its vigour is remarkable, and when pot-grown, it soon fills an eight-inch pot with a mass of roots and produces great quantities of flowers.

*A. scapigera* may be had in bloom any month of the year; if grown in a warm house, and provided the flowers are pollinated, good seed is produced in abundance.

At present, we have some two hundred young plants raised from home-saved seeds of the best forms. It can be divided with the greatest ease and these divisions seem quite as vigorous as plants raised from seeds.

It is almost impossible to describe the foliage, as no two plants are exactly alike. On the same specimen may be found leaves that are entire, others lyrate and pinnatifid; the upper surface is of a dull green, the underside white and woolly. Some plants have white foliage similar to the well-known *Centaurea candidissima*.

Another fine *Arctotis* is *A. undulata*; this species is also in flower, and was introduced by Mrs. Lloyd Edwards a few years ago. It shows the same fine colour range but there is less diversity in the foliage; the flowers are

carried on footstalks two feet long. Like *A. scapigera*, it is a perennial of the easiest cultivation. *T. Hay.*

### ASTERS.

*CALLISTEPHUS chinensis*, the China Aster, in its many beautiful single and double varieties, is deservedly popular for garden and general decorative work. The seeds should be sown now thinly in boxes, as the seedlings are very prone to damping off, and overcrowding in their younger stages will probably lead to attacks of *Botrytis* later.

As Asters transplant readily, even when they are coming into flower, it is not necessary to plant them direct in their flowering quarters, but, if desired, they may be planted in the reserve garden, from which they may be lifted later to refurbish beds where early-flowering plants are over. *J. C.*

## HARDY FLOWER BORDER.

### ANCHUSA ITALICA DROPMORE VARIETY.

THE subject of this note is a well-known plant, and is invaluable for planting in groups in the herbaceous border or for filling beds on the lawn. As a garden subject it is infinitely better than the type, the flowers being much larger—nearly one-and-a-half inch in diameter—and of an intense blue. They are borne in great profusion, so that a group of plants appears as a sheet of blue when viewed from a little distance.

This *Anchusa* remains in bloom for a long period, and the spikes last for a long time when cut and placed in water. Given good treatment, a vigorous specimen will attain a height of six feet or more, and in due season will be clothed from base to summit with bloom.

Seeds are not a satisfactory means of increase as many of the seedlings do not come true. The best method of propagating the plant is from root-cuttings. These should be taken from plants lifted during the winter, cut into pieces about two inches long, and inserted in pots of sandy soil. The pots should be stood in a cold frame and top growth will appear in a few weeks. The young plants should be grown on for planting out so soon as danger from frost is over.

A group of this *Anchusa*, planted in a suitable situation in the wilder portion of the garden, produces a wonderful effect when in flower. *T. H. Everett.*

## CULTURAL MEMORANDA.

### PROPAGATING ANTIRRHINUMS AND OTHER FLOWERS FROM CUTTINGS.

LAST year I required a large number of Antirrhinums for bedding, and as is my usual plan, I sowed the seeds about the end of January in order to get the plants well forward and hardened before they were required for planting in the beds. At the time of pricking them off for the first time, I found that it would be impossible to get the necessary number, so I had the alternative of buying more seeds, which would give later plants, or finding some other means of making good the deficit. As a matter of fact, I did both.

The young plants which were pricked off into boxes did well, and in a warm temperature they soon became established in the boxes. At that time, the idea occurred to me that it might be possible to root the tops, and in order to test this, I put in about a dozen tops, cutting these off with a pair of scissors just above the lowest pair of leaves, so that my cuttings were mere tops with a bunch of leaves at the extremity. The shoots were dibbled into wet sand in a closed propagator standing in a vinery. In ten days they had rooted,

## WILLIS BROS.' Garden Fertiliser

THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1 cwt., 15/-; 1/2-cwt., 9/-; 28 lb. 5/-; £14 10/- per ton. All Carriage Paid.

LOOK TO YOUR VINES!  
The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

### LAWN MANURE.

Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

### LAWN SAND AND DAISY KILLER.

This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid. DIRECTIONS FOR USE.—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

### SUSSEX TRUG BASKETS.

18" 4/-; 20" 5/-; 22" 6/-; 24" 7/-; 26" 8/-; each. Carriage Paid.

and on the success of this experiment I at once took the tops off four hundred plants and dibbled them into the sand propagator. Practically all of them rooted, and were in due course boxed up and took their place among the seedling *Antirrhinums*.

As I was still a bit sceptical regarding the ultimate success of the experiment, so far as flowering was concerned, I kept them marked, and eventually made a separate bed of them. Though they were about a week later in flowering than the seedlings, the tops of which were not taken off, it would have been otherwise difficult to see any difference between the beds when the plants were fully in flower. The *Antirrhinums* from which the cuttings were taken were planted out also and gave good results. The date when the small cuttings were taken was April 20, and on April 28 I was able to remove and box over two hundred rooted cuttings, the remainder being put back again for a few days because they were not sufficiently rooted.

I find also that it is quite possible to root way pieces of *Heliotrope* in precisely the same I required about 1,200 plants for bedding by May or June and had only one hundred cuttings but by rooting these and then snipping off the tops with a pair of scissors so soon as they were long enough to enable this to be done and still leave some buds at the base, I was able to get well over the number required. Usually these rooted in about ten days, and after another ten days the tops were taken off and put into the propagator.

I find also that it is easy to root internodal cuttings of the mauve *Nepeta Mussinii*. These also were snipped off with scissors, not below a joint as is usual, but above it so that there was no need to remove any of the leaves, and only the one cut of the scissors was needed.

The cuttings were taken from plants which had been grown beneath the shelter of a south wall so that the growths were well forward. The date of putting them in the propagator was February 16, and a later batch was inserted on April 6. The first lot was rooted by March 1, and the second lot on April 20, making about a fortnight in each case. The plants were boxed and eventually planted among *Roses* to add a little colour, but they grew so well that I was forced to clip them back with sheep shears late in July to prevent them from smothering the *Roses*, which were set at two feet apart. I merely give these notes for the benefit of those who, like myself, have sometimes to propagate plants in a hurry.

Doubtless there are many other plants which could be successfully rooted as internodal cuttings. *William F. Rowles, Wroxham Hall Gardens, Norwich.*

## ALPINE GARDEN.

### ERYTHRONIUM REVOLUTUM PINK BEAUTY.

THE nomenclature of the *Erythroniums*, or Dog's-Tooth Violets, is a little obscure, and some would class the one named Pink Beauty with another species than *revolutum*. I am, however, following the classification of a good authority. It is just coming into flower with me and, to-day (April 4) looks as if it would be open fully in a few days.

I have had this Dog's-Tooth Violet for many years; it was removed six years ago to its present position in a border facing south, where it spears through a plant of one of Backhouse's varieties of *Erica carnea*. It looks delightful there, with its large, lovely, marbled leaves of deep green and white, and its handsome, charmingly coloured pink flowers on stems about nine inches high. There are brown tinges on the leaves which add to the attractions of the foliage.

The plant does not increase rapidly with me, but the necessity of removing it when in flower is not conducive to increase, and it has another removal in store in this month of April. However, I am confident that it will not suffer if due care is taken of it. I regard Pink Beauty as one of the most fascinating of the American *Erythroniums*. *S. Arnott.*

### STACHYS CORSICA.

THIS uncommon species is a charming carpeting plant for the rock garden. Being of easy culture and rapid in growth, it is deserving of wider cultivation than it at present enjoys. It is of dwarf, prostrate habit, forming a dense carpet of small, bright green leaves, which are about half-an-inch in length, ovate, with broadly crenated margins and blunt apices. The flowers are produced throughout the summer in such profusion as to practically cover the whole plant with a sheet of pink-tinted cream, the individual, large-lipped blooms being of considerable size for so small a plant.

*S. corsica* is a native of Corsica and Sardinia, where it is to be found chiefly in cornfields. To secure the best results in the rock garden it should be planted in light, well-drained soil in a sunny position, under which conditions it will survive the winter.

As indicated by the accompanying illustration (Fig. 131), it is a useful subject for a display in late spring in the alpine house. *A. G. F.*

FIG. 131.—STACHYS CORSICA.

### TWO ROCKERY CRANESBILLS.

*ERODIUM chamaedryoides* is the gem of the family. It is a native of the Balearic Isles and Corsica and forms a tuft, half-an-inch high, of dark green, scalloped foliage. From June to September the plant produces numerous rose-veined, white flowers, singly on stalks one inch tall. A sunny ledge should be chosen for this *Cranesbill*, and a deep, light soil, as it roots deeply.

*E. corsicum*, from Corsica and Sardinia, is a larger plant forming mats of silvery foliage covered with down, and producing glowing rose-pink flowers on three-inch stems. It should have an equally sunny, but not so choice a place as the above. *L. T.*

### HABERLEA RHODOPENSIS.

THIS *Haberlea* is a beautiful companion to *Ramondia*, and will thrive under similar conditions. The horizontal position usually recommended for this and *Ramondias* is by no means essential, provided stagnant moisture does not settle around the crowns. I recommend arrang-

ing the plants on a slightly elevated position: some of the finest specimens I have seen were grown in this way.

The rosettes of leaves are deep green and corrugated like those of *Ramondia*. From the stems arise long, tubular, drooping flowers of a pretty shade of lilac, with a yellow throat. *G. L.*

## BOG GARDEN.

### PRIMULA ROSEA.

THIS Himalayan *Primula* is now in full beauty of flowering, before the foliage is fully developed. The stout pedicels are from four inches to six inches long and surmounted by umbels of bright rose-coloured buds, turning to a bright rosy carmine colour as the flowers develop gradually.

The foliage lies close to the ground in rosette

formation until after flowering, when the leaves commence to develop; whilst, at the same time, the flower pedicels elongate somewhat as the seed capsules are formed.

An admirable situation for this little gem is on the edge of a stream where the roots can obtain abundant moisture; often the roots will hang down into the stream.

Every two or three years, or when the plants appear to be of poor quality, they should be lifted after flowering and replanted in turves of good, fibrous loam, by the stream's edge, so that whilst new roots are forming additional nourishment may also be provided for the developing crowns. The plants are often slightly lifted out of the soil by the action of frost, and should be made firm again by applying a top-dressing of leaves and sand, and then pressing the crowns gently into the turves.

This *Primula* may be grown successfully in pots for use in the alpine house. Given the necessary requirements, *Primula rosea* should flourish almost anywhere, and those growing it will assuredly be rewarded adequately. *T. D. B.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W C 2

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, if artless, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## IDEAL GARDENS AND PLANT LORE.

## I.—A GARDEN OF ADONIS-FLOWERS.

"That garden where  
Venus with her revived Adonis spend  
Their pleasant hours." *Massinger.*

MY old-time dream has never been fulfilled. It was my wish to have sufficient leisure, wealth and land to lay out a series of beds, parterres or gardens, and fill them with flowers and plants relating to saints and divinities, heroes and virgins, who have left their special imprint on our garden and plant-lore. A border was to be devoted to Venus, and a bed to her successor the Virgin; Hercules and Juno would, perhaps, have found a place, and the flowers of St. John would have claimed a site, for he has given us much. And thus, as I roamed at leisure from point to point, my memory would have been refreshed concerning the great and good who, either in legend and history, in myth or action, in poetry and in prose, have enriched our lives, set us noble examples, or embodied for us in tradition or song many things relating to the past which ought not to be forgotten by those who inherit so great a legacy.

It is not claimed that the idea is an entirely new one. At Stratford, for example, a garden is devoted to the plants which are mentioned by Shakespeare. Elsewhere is to be found a Garden of Bible Plants, and other attempts to put this thought into practice. It might be yet further extended, and gardens devoted to Paradise Lost or the poems of Milton, to Dante, Homer and others. A Canticles' Garden, containing all the plants to which allusion is made in the Song of Songs, a Virgil Garden on the same lines, or a border stocked with the plants which are sung by Horace, would each and all prove instructive and interesting. What a variety of legends and traditions, what history, poetry, science and lore of many kinds would gather around such beds and borders, and how valuable would they not become when used for the purpose of teaching the subjects to our children and scholars.

That others may carry out the suggestion, if they so desire, it is proposed to take up in turn some of these poets and authors, saints, heroes or divinities, enumerating the plants which are associated with their names or works, and giving such particulars relating to the plant-lore and legends connected with them as may prove most attractive or instructive.

To begin with, a survey may be made of the various plants which would in this way claim a place in a new Garden of Adonis.

It was pointed out in a previous article\* that the term "Gardens of Adonis" is erroneously limited by some writers to the pots or baskets which were sown with Lettuce, Fennel, Cress and other plants which soon withered and died. Milton, who was a classical scholar, uses the term (as does Massinger, whom I have quoted at the head of this article) in quite another sense, when he tells us that Eden was a place of charm:—

"Spot more delicious than those gardens  
feign'd,

Or of revived Adonis, or renown'd

Alcinous, host of old Laertes' son,

Or that, not mystic, where the sapient king.

Held dalliance with his fair Egyptian spouse.

Though pushed into the background through the emphasis which was laid on the other usage, I claim that Pliny and Milton were right in using the term "Gardens of Adonis" in the sense of Garden of Love or Pleasure.

FIG. 132.—DENDROCALAMUS GIGANTEUS.

The "Giant Bamboo" in the Peradeniya Gardens, Ceylon; height, about 90 ft.; circumference of largest stems, at base, about 30 inches.

Standing recently by the Arch of Titus, in Rome, I found the entrance to "a wild and beautiful garden possessing most lovely views of the various ruins, occupying the site of the Gardens of Adonis." It was planted by Domitian, and he ought to be a better authority on the subject than those who lived nearly two thousand years later. Why may we not follow him, and devote a plot of ground to the cultivation of those plants which have been consecrated to Adonis' memory? With a marble statue of the beautiful boy in the midst, how pleasing would be the effect.

What would our garden contain? Adonis, it will be remembered, was the son of Theias and Smyrna, Cinyras and Myrrha, or some other fabulous pair, and was of such surpassing loveliness that Aphrodite or Venus became enamoured of him. He was eventually slain by a wild boar, and from his body sprang a flower. Perhaps this was the way in which in pre-logical times, men tried to account for the soul. If a flower grew up where a body was slain, was it not the dead one come to life again?

What, then, was the plant which in this

instance came into existence? This question has received many answers, and if we collect all the different forms to which the legend has been attached, and add thereto such other plants as have become associated with the name of the hero, our Garden of Adonis will not be lacking in charm. We will proceed to plant:—

## THE ANEMONE.

According to some writers the one and rightful claimant to the honour of being the true Adonis flower is the large-blossomed red Anemone. To give all the variants of the legend would be to fill a volume. Thanks, however, to the recent researches of Semitic and other scholars, interesting light has in these recent days been thrown upon the subject. It used to be contended that the word Anemone came from the Greek, and it was therefore called the Wind Flower. Among the Arabs, however, we find that the red Anemone, or Poppy Anemone (*A. coronaria*), is named "Shakaiku'n noman," or the wounds of Noman. Noman is the Arabic equivalent of the Hebrew Naaman, which means The Pleasant One, and it is held by competent scholars that this name was applied to Adonis, just as Buddha was spoken of as The Pure One, or Jehovah was named The Holy One. Thus, Adonis was known as The Pleasant One, or perhaps better as "He who gave pleasure by his beauty and charm." When he was slain, the red Anemone sprang from his blood-drops, and so became known as the Flower or Wounds of Adonis, and the etymology of the name Anemone is now traced to Naaman or Noman. It would be wearisome to the general reader to work through all the details, but scholars who are interested will find all the critical apparatus in the newest lexicons and cyclopaedias bearing on Semitic studies and comparative religion.

It is to be noted that those who prefer other flowers to this, still link the Anemone with the Adonis legend. Thus the Greek poet Bion, in his epitaph on Adonis, makes the Anemone the offspring of the tears of Venus or Aphrodite. In any case, this flower must receive the primary place in our new Garden of Adonis.

## ARGEMONE.

The true flower of Adonis must, of course, be of a sanguineous hue—red, scarlet, purple, crimson, or the like. In an ancient codex of Dioscorides which is preserved in Vienna is to be found an illustration of the Adonis-flower as described by Ovid under the name Argemone. This is the designation of a genus of plants belonging to the Poppy Order (*Papaveraceae*), and if a red-flowering variety cannot be obtained, our own flora supplies us with an excellent substitute in the cornfield Poppy (*P. Argemone*, L.). This would recall, also, the Red Poppies of Flanders, and link up the legend of Adonis with our own more recent history. A learned German authority on the mythology of plants informs us that the Argemone or Poppy with scarlet blossoms agrees well with the flower mentioned in the Adonis tradition.

The list of plants, however, is a somewhat lengthy one, and other kinds must be reserved for another article. *Hilderic Friend.*

(To be continued.)

## THE GROWTH OF BAMBOOS.

THE rate of growth in plant life is a subject upon which I know little or nothing, but I should imagine it attains its maximum in the more humid tropical districts. In Ceylon and Java careful records have been kept by competent observers of the vertical growth of the Giant Bamboo, *Dendrocalamus giganteus*. To those who are only familiar with plants in the temperate zone, the figures obtained appear to be almost incredible. At the Peradeniya Botanical Gardens, near Kandy, Ceylon, Dr. Lock found that a young shoot of this Bamboo grew 18½ inches in twenty-four hours, during the rains of the south-west Monsoon, while Krans, of

\*The Gardeners' Chronicle, February, 1926, p. 186; and January 29 and February 26, 1927.

Buitenzorg, in Java, noted 22·4 inches during the same space of time. Nearly an inch an hour! It almost reads like a Jack-and-the-Beanstalk fairy tale!

In all probability, development is equally rapid in its native countries, which are Burma and Malaya, but on this point I have no information. At Peradeniya, where the plant was introduced in 1856, I roughly estimated that the height of a fully mature stem was between eighty feet and ninety feet, while the girth near the base must have been over two feet. My thanks are due to Mr. Parsons, Curator of these gardens for the above-quoted records of growth.

It may be noted that even in England the stems of the Japanese Bamboo, *Phyllostachys mitis*, have, according to Bean, grown nearly a foot in twenty-four hours. In Japan the young shoots of this species are commonly eaten as a vegetable. Although rather tasteless, with a suitable sauce these form a sufficiently palatable dish, but possibly their chief merit lies in the consistency of the "flesh," which has a pleasing crunch, like that of a raw Celery root. In order to obtain large-sized shoots when the plant is cultivated as a vegetable, only one stem is allowed to mature; when grown for the sake of the canes, it is permitted to form dense clumps. *Collingwood Ingram.*

### THE LATE SIR THOMAS HANBURY AND LA MORTOLA.

As one who spent twenty years at La Mortola, having the great privilege and pleasure to be Sir Thomas Hanbury's collaborator, I consider it a debt of gratitude to his memory to recall to the readers of *The Gardeners' Chronicle* that March 9 was the twentieth anniversary of his death, and that on May 2, 1927, it will be sixty years since he purchased La Mortola. In 1867, after a life of strenuous work in China Sir Thomas Hanbury came as a winter visitor to the Riviera, and decided to carry out the dream of his early youth to create a botanical garden somewhere on the Mediterranean and to share its pleasures and botanical interests with his brother Daniel, the famous pharmacologist.

When he became acquainted with the little Cape of La Mortola, the beauty of which made a striking impression upon him when he first approached it by sea, he decided to purchase the place. At that time it was little more than an abandoned countryside, with scanty vegetation, poor vineyards, and Olive groves surrounding an old Palazzo of the Renaissance period, but almost a ruin.

There have been created other fine gardens along the Riviera, some before and many afterwards, but none can rival La Mortola. It is not only the unique natural beauty of the place, but the way the brothers Thomas and Daniel Hanbury undertook the work that strikes those who visit the gardens. It was their ideals, their perseverance and skill, that built up the garden and directed its progress. Both possessed a wonderful gift for preserving and increasing the natural beauties of the spot and a desire and capability to collect and to grow the innumerable treasures of plants that soon began to fill and to enliven the place, and which since have made it the Mecca of all plant-lovers.

I need not repeat the early history of this famous garden. It has often been told in *The Gardeners' Chronicle*, and the late Lady Hanbury has left a most charming account of it in her *Letters of Thomas Hanbury*, a book I wish to recommend to everybody who has been at La Mortola. Also in the *Hortus Mortolensis*, published in 1912, a short history of the garden and some account of the plants are given. Besides, many excellent descriptions of the garden were given by enthusiastic visitors, among them perhaps the best by the late Professor Flückiger, and by E. Strasburger in his *Rambles on the Riviera*.

In addition to the services rendered to botany and horticulture by his own garden, Sir Thomas Hanbury founded, in 1892, the Institute Botanico Hanbury of the University of Genoa, where his friend Dr. O. Penzig has worked since as Professor of Botany; and the Royal Horticultural Society owes to his generosity the gift of Wisley Gardens.

Sixty years is a long time, not only in human life but also in a garden. Many a small tree that hardly showed anything of its real character has had time to grow into an imposing specimen at La Mortola. Many changes came and were necessary and prove also that a garden is something living, that has its youth and its age and changing periods. Moreover, the history or biography of a garden can be as attractive as that of man. For about forty years Sir Thomas Hanbury enjoyed his garden. During that time

### GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

THE note on page 225 from *The Gardeners' Chronicle* of 1852 is of much interest at the present time, when the genus *Rhododendron* has won such importance in decorative planting. British springtide must ever remain as Mr. Masters (father of the late Dr. Maxwell Tylden Masters) found it seventy-five years ago—a season of anxiety for *Rhododendron* enthusiasts.

The present spring bears an ominous resemblance to that of 1926 when, in this district at least, the mildness of March and April were the prelude to 7° of frost on May 15. Never before

FIG.—133.—RHODODENDRON ARGYROPHYLLUM.

(see p. 264.)

he lived up to his ideal, i.e., that to promulgate the love for plants and to distribute seeds and plants, was his mission in life. How much he and long after him, his garden, have contributed towards this aim is difficult to tell, but it can hardly be over-estimated. A wealth of wonderful plants that now adorn the gardens along the Mediterranean and in other similar climates the world over owe their introduction to La Mortola.

It was a noble pursuit to create and maintain this garden. It is to be hoped that many future generations will enjoy it and benefit by it, and that the ashes of the founder of this unique garden may quietly rest under the shadows of the century-old, tall, Mourning Cypress trees of La Mortola. *Alwin Berger.*

have I known the young growth on *R. barbatum* to be frosted, for that species is prudently late in starting. Shoots six inches long were killed on a seven-foot bush of *R. pachytrichum*; yet, strange to say, that bush flowered generously in March of the present year. Further mischief was wrought by an unusually sharp frost in the closing days of October; but on the whole, the damage from unfavourable weather has proved less serious than might have been expected.

While *R. arboreum* and *R. campanulatum* are sparsely furnished with bloom this year, the soft splendour of *R. Fargesii* and *R. oreodoxa* has been very gratifying, and we are looking forward to a specially lavish display on *R. decorum*.

Among the species that flowered here for the first time last year, two are worth noting as very desirable. *R. cyclium*, discovered by Forrest in 1919, resembles its near relative *R. Souliei* in stature, foliage and flower, with this important difference, that, whereas the carmine buds of *R. Souliei* open to flowers of a wan white, the blossoms of *R. cyclium* remain delicate rose till they fade. The other is *R. desquamatum*, introduced by Forrest in 1817. It is of the *Heliolepis* series, and when it approaches the height of twenty to twenty-five feet, as reported, it should be a beautiful object if well set with its white and mauve, purple-spotted flowers.

Not many flowers last so well as *Rhododendrons* when cut and brought into the house, provided they are kept in a cool place. Three weeks and two days ago I placed a couple of trusses of *R. sutchuenense* in the porch, and to-day they are still untarnished. The flowers of this species are pale rose, with crimson markings.

Chance contrasts and harmonies of colour are worth noting. *Narcissus Johnstonii* Queen

## NOTES FROM GLASNEVIN.

MARCH was a stormy, wet month, redeemed only towards the end by occasional sunny days with rather less wind. There was, however, no lack of interest in the garden, and especially in many of the bulbous plants that followed the Snowdrops and Crocuses of February and early March.

The early Squills, *Scilla bifolia* and *S. sibirica*, have been very beautiful for several weeks and particularly good is the form of *S. sibirica* called *ucranica*, of uncertain origin. The flowers are more numerous on each stem and are of a deeper and more intense shade of blue; grouped in the rock garden, massed under shrubs, or furnishing the front of a border, these early blue flowers are delightful. There are white and pink varieties of *S. sibirica*, but they lack the charm of the typical blue colour. Of equal value are the *Chionodoxas* of which there are several species and many varieties. *C. Luciliae* is the so-called Glory of the Snow and needs no encomiums; the variety *gigantea* has larger

*Bulbocodium*, which I have alluded to in former notes. This year the colony is better than ever, and *Narcissus moschatos*, with nodding, white flowers, also loves a gritty soil in a sunny position, and is now in flower. *N. minor*, *N. minimus*, *N. triandrus* and *N. cyclamineus* have all flowered recently in the rock garden, and in their dainty beauty are in marked contrast to the masses of large-flowered garden varieties now flowering in thousands in the grass and the hundreds of named varieties of all sections now on view in a long border set apart for this purpose.

Other prominent plants in the rock garden at present are the hybrids of *Primula juliae*, including *P. Jewel*, *P. Juliana*, *P. Wanda*, and *P. Purple Splendour*, the last, in my opinion, the best of all; the plants are at the moment literally one mass of flower. *Primula rosea*, by the pond and river, is just coming into full bloom, and a colony of *P. denticulata*, with its roots in the water, looks remarkably happy. Other species and varieties of *Primula* in flower are *P. Palinuri*, *P. ciliata*, *P. marginata* and its variety or hybrid *Linda Pope*.

Visitors show great interest in several fine groups of *Viola gracilis* which are now full of flower, the dark, purple-blue blooms, each with a white "eye," proving a great attraction. Many clumps of the Pasque Flower, *Anemone Pulsatilla*, are in bloom, and show great variation. In some, the flowers are pale with pointed sepals and borne on tall stalks, while in others the colour is deeper, the sepals blunter and the stalks scarcely exceeding the fast developing leaves. Interesting, too, is the "Shaggy Windflower," *Anemone vernalis*, whose opalescent flowers, furnished with long, soft hairs, are now open. Clumps of *Anemone Hepatica* lend colour to the rock garden, which is rapidly coming into its own again, helped immensely by the dwarf *Rhododendrons*, which we owe to the indefatigable efforts of several intrepid collectors. Noteworthy at present are dwarf, twiggly forms of *R. racemosum*, *R. hippophaeoides* covered with blue flowers, *R. telmateium*, *R. mollicomum*, pink, and *R. flavidum*, yellow. The next few weeks, given reasonable weather, will see a large accession to the number of *Rhododendrons* in bloom.

Notable among shrubby plants now in bloom are *Clematis Armandii* and *C. A. Appleblossom*, the former white and the latter with pink-tinted flowers; both succeed best here on a wall facing north. *Forsythias* bloomed profusely, the best being *F. intermedia spectabilis*, with deep yellow flowers, and *Wilson's F. suspensa atrocaulis*, with dark shoots and large, clear-yellow flowers. These are being quickly followed by the *Prunuses*, of which many will flower during April. At present, *P. tomentosa endotricha* is in full bloom, somewhat in advance of the type, which, as grown here, as a much finer plant. I am of the opinion, however, that *P. tomentosa* varies in quality of flower when raised from seeds, and only the finest forms should be propagated from cuttings or layers. *P. subhirtella* is in full flower, and the beautiful forms of *P. serrulata* will in all probability be just right for Easter. Others now in flower are *P. Amygdalus macrocarpa*, *P. consociiflora*, *P. triflora* and *P. Sargentii*.

## INDOOR PLANTS.

Among the more striking of the plants flowering under glass, mention may be made of a fine group of *Hippeastrums*, of which a large number was bequeathed to the Gardens by the late Lt.-Col. Sir George Holford. His collection was generally admitted to be the finest extant, and the large, richly-coloured flowers are a source of great interest and pleasure to visitors.

*Sedum bellum* (Fig. 131) is a dainty Mexican species well-adapted to the cool greenhouse or alpine house. The shoots of the current year are thickly clothed with mealy leaves, and those of the previous year are bearing large corymbs of pure white flowers; after flowering the shoots die.

*Aotus gracillima*, once a well-known greenhouse plant, is now seldom seen in private gardens, yet all it requires is greenhouse treatment. The shoots of last year are now wreathed in small, pea-shaped, yellow flowers. After flowering, the shoots should be shortened

FIG. 134.—*SEDUM BELLUM* IN THE GLASNEVIN BOTANIC GARDENS.

of Spain, a natural hybrid from the mountains of Portugal, never shows to better advantage than when springing from a carpet of purple *Aubrietia*, and *N. Bulbocodium citrinus* chimes agreeably with the pale mauve *Aubrietia deltoidea* var. *græca*. We have never been able to keep here the rich yellow *N. Bulbocodium*, which, I suppose, is the type; but the sulphur-yellow *N. citrinus* thrives vigorously and increases self-sown.

One does not often see the Snow-flake—*Leucojum vernum*—naturalised in woodland, where it can be established as easily as the Snowdrop. It ripens plenty of seeds and spreads fast; but it should not be planted among Snowdrops, for their flowering seasons overlap, and the pallor of the Snowdrop suffers in competition with the more opaque white of the Snowflake.

It would be interesting to hear whether any of your readers have experience of a dark grey aphid or chermes attacking the foliage of *Viburnum Carlesii*. I noticed it first in an Irish garden last year. On returning home, I found that a bush here, about five feet high, which had flowered very freely in April, had been completely defoliated by swarms of this pest. A second crop of leaves developed in summer; the aphides did not reappear, but that bush has not a single flower on it this year, which is not surprising, seeing the severe check the plant sustained in the loss of its foliage in 1926. Our other bushes were not attacked. *Herbert Maxwell, Monreith.*

flowers, rather paler in colour, but still invaluable for massing under shrubs and about the rock garden. *C. L. Tmolii* and *C. L. Boissieri* are good and distinct, as also is *C. L. sardensis*, but the best of all for effect is *C. Siehei* (*Bot. Mag.* 9068), and it is usually the earliest here. The flower stems are tall and stout, bearing many flowers of deep blue.

*Tulipa Kaufmanniana* is assuredly one of the best species as it is the earliest. It is variable in colour, ranging from creamy white to rich red in the variety *coccinea*. A very fine unnamed form from Turkestan is deep carmine on the outside of the segments. The variety *intermedia* is the most distinctly yellow of all the forms, and has the brown, mottled leaves of *T. Greigii*. *T. Eichleri*, a robust species, is now flaunting its large, bright red flowers, and is very conspicuous in the rockery from a long distance. It will be followed soon by the even more striking *T. Fosteri*. *T. pulchella* is a dwarf species with globular flowers of a pink shade; it loves a sunny, well-drained pocket in the rock garden, where, indeed, all the Tulip species flourish. The smaller species seem to like a gritty soil, for *T. stellata* has lived happily for many years in a gritty moraine and never fails to flower freely.

In the same moraine, *Fritillaria armena* is flowering, the nodding, bright yellow flowers at once attracting the lover of plants although the total height of the plant in flower is only some four inches to five inches. Another satisfactory plant in the moraine is *Narcissus*

## BENTLEY'S WEED DESTROYER

(POISON)

Has ranked first for nearly fifty years.

Stronger than any other. One application keeps gravel paths and drives clean for nearly two years. Commands the largest sale both at home and abroad, with a rapidly spreading popularity.

Concentrated Liquid (1 to 80)

3 galls., 19/-; 6 galls., 36/-; 12 galls., 69/-; 24 galls., 126/-; 40 galls., 200/-

(Powder 1 to 25).

6 tins, 18/9; 8 tins, 18/-; 12 tins, 25/6; 20 tins, 40/9; 40 tins, 78/-.

## BENTLEY'S DAISY KILLER

The only scientific Lawn Sand.

Weeds of all kinds are quickly killed by one dressing of this unique speciality. Afterwards the finer grasses are free to develop into a dense, rich green sward.

One pound is sufficient to dress 3 sq. yards.

1 ton £26; 4 cwt. 26/6 per cwt.; 1 cwt. 28/-; 56 lbs. 15/6; 28 lbs. 8/6; 14 lbs. 4/9; tins 1/6 each.

Carriage paid on 15/- orders and upwards.

Sole Manufacturers:

JOSEPH BENTLEY LIMITED

Barrow-on-Humber, Linco.

Other species and varieties of *Primula* in flower are *P. Palinuri*, *P. ciliata*, *P. marginata* and its variety or hybrid *Linda Pope*.

Visitors show great interest in several fine groups of *Viola gracilis* which are now full of flower, the dark, purple-blue blooms, each with a white "eye," proving a great attraction. Many clumps of the Pasque Flower, *Anemone Pulsatilla*, are in bloom, and show great variation. In some, the flowers are pale with pointed sepals and borne on tall stalks, while in others the colour is deeper, the sepals blunter and the stalks scarcely exceeding the fast developing leaves. Interesting, too, is the "Shaggy Windflower," *Anemone vernalis*, whose opalescent flowers, furnished with long, soft hairs, are now open. Clumps of *Anemone Hepatica* lend colour to the rock garden, which is rapidly coming into its own again, helped immensely by the dwarf *Rhododendrons*, which we owe to the indefatigable efforts of several intrepid collectors. Noteworthy at present are dwarf, twiggy forms of *R. racemosum*, *R. hippophaeoides* covered with blue flowers, *R. telmateium*, *R. mollicomum*, pink, and *R. flavidum*, yellow. The next few weeks, given reasonable weather, will see a large accession to the number of *Rhododendrons* in bloom.

Notable among shrubby plants now in bloom are *Clematis Armandii* and *C. A. Appleblossom*, the former white and the latter with pink-tinted flowers; both succeed best here on a wall facing north. *Forsythias* bloomed profusely, the best being *F. intermedia spectabilis*, with deep yellow flowers, and *Wilson's F. suspensa atrocaulis*, with dark shoots and large, clear-yellow flowers. These are being quickly followed by the *Prunuses*, of which many will flower during April. At present, *P. tomentosa endotricha* is in full bloom, somewhat in advance of the type, which, as grown here, as a much finer plant. I am of the opinion, however, that *P. tomentosa* varies in quality of flower when raised from seeds, and only the finest forms should be propagated from cuttings or layers. *P. subhirtella* is in full flower, and the beautiful forms of *P. serrulata* will in all probability be just right for Easter. Others now in flower are *P. Amygdalus macrocarpa*, *P. consociiflora*, *P. triflora* and *P. Sargentii*.

### INDOOR PLANTS.

Among the more striking of the plants flowering under glass, mention may be made of a fine group of *Hippeastrums*, of which a large number was bequeathed to the Gardens by the late Lt.-Col. Sir George Holford. His collection was generally admitted to be the finest extant, and the large, richly-coloured flowers are a source of great interest and pleasure to visitors.

*Sedum bellum* (Fig. 131) is a dainty Mexican species well-adapted to the cool greenhouse or alpine house. The shoots of the current year are thickly clothed with mealy leaves, and those of the previous year are bearing large corymbs of pure white flowers; after flowering the shoots die.

*Aotus gracillima*, once a well-known greenhouse plant, is now seldom seen in private gardens, yet all it requires is greenhouse treatment. The shoots of last year are now wreathed in small, pea-shaped, yellow flowers. After flowering, the shoots should be shortened

FIG. 134.—*SEDUM BELLUM* IN THE GLASNEVIN BOTANIC GARDENS.

of Spain, a natural hybrid from the mountains of Portugal, never shows to better advantage than when springing from a carpet of purple *Aubrietia*, and *N. Bulbocodium citrinus* chimes agreeably with the pale mauve *Aubrietia deltoidea* var. *græca*. We have never been able to keep here the rich yellow *N. Bulbocodium*, which, I suppose, is the type; but the sulphur-yellow *N. citrinus* thrives vigorously and increases self-sown.

One does not often see the Snow-flake—*Leucojum vernum*—naturalised in woodland, where it can be established as easily as the Snowdrop. It ripens plenty of seeds and spreads fast; but it should not be planted among Snowdrops, for their flowering seasons overlap, and the pallor of the Snowdrop suffers in competition with the more opaque white of the Snowflake.

It would be interesting to hear whether any of your readers have experience of a dark grey aphid or chermes attacking the foliage of *Viburnum Carlesii*. I noticed it first in an Irish garden last year. On returning home, I found that a bush here, about five feet high, which had flowered very freely in April, had been completely defoliated by swarms of this pest. A second crop of leaves developed in summer; the aphides did not reappear, but that bush has not a single flower on it this year, which is not surprising, seeing the severe check the plant sustained in the loss of its foliage in 1926. Our other bushes were not attacked. *Herbert Maxwell, Monreith.*

flowers, rather paler in colour, but still invaluable for massing under shrubs and about the rock garden. *C. L. Tmoli* and *C. L. Boissieri* are good and distinct, as also is *C. L. sardensis*, but the best of all for effect is *C. Siehei* (*Bot. Mag.* 9068), and it is usually the earliest here. The flower stems are tall and stout, bearing many flowers of deep blue.

*Tulipa Kaufmanniana* is assuredly one of the best species as it is the earliest. It is variable in colour, ranging from creamy white to rich red in the variety *coccinea*. A very fine unnamed form from Turkestan is deep carmine on the outside of the segments. The variety *intermedia* is the most distinctly yellow of all the forms, and has the brown, mottled leaves of *T. Greigii*. *T. Eichleri*, a robust species, is now flaunting its large, bright red flowers, and is very conspicuous in the rockery from a long distance. It will be followed soon by the even more striking *T. Fosteri*. *T. pulchella* is a dwarf species with globular flowers of a pink shade; it loves a sunny, well-drained pocket in the rock garden, where, indeed, all the Tulip species flourish. The smaller species seem to like a gritty soil, for *T. stellata* has lived happily for many years in a gritty moraine and never fails to flower freely.

In the same moraine, *Fritillaria armena* is flowering, the nodding, bright yellow flowers at once attracting the lover of plants although the total height of the plant in flower is only some four inches to five inches. Another satisfactory plant in the moraine is *Narcissus*

## BENTLEY'S WEED DESTROYER

(POISON)

Has ranked first for nearly fifty years.

Stronger than any other. One application keeps gravel paths and drives clean for nearly two years.

Commands the largest sale both at home and abroad, with a rapidly spreading popularity.

Concentrated Liquid (1 to 80)

3 galls., 19/-; 6 galls., 36/-; 12 galls., 69/-; 24 galls., 126/-; 40 galls., 200/-

(Powder 1 to 25).

## KELWAY'S DELPHINIUMS

THE TOUCH OF SPRING is upon the garden—Now is the time to plant KELWAY'S DELPHINIUMS. An Ideal Hardy plant for every garden. The magnificent Delphinium or Perennial Larkspur is one of the several hardy perennials which Kelways have brought to a high degree of beauty. It was the firm of Kelway which first improved the varieties and gave the plant its leading position in the flower garden. The many-flowered spikes make a striking display wherever they are grown. No garden plan and no colour scheme can be looked upon as complete without Kelway's lovely blue Delphiniums.

They are at prices to suit every purse, for example:

Collection 'B,' good varieties to name, 21/- per doz., 150/- 100  
Collection 'D,' a wonderful selection, 40/- per doz., 300/- 100  
Collection 'F,' the cream of the varieties - 70/- per doz.

Carefully packed and sent free when remittance is enclosed with order for £3 and over; or a descriptive priced catalogue will be sent on demand.

'Here were new types, new habits of thought, new ideas, new reactions, new morals, new ways of living.'—H. G. Wells on the present age. And there is the old love of flowers and gardens but a desire for new types of flowers.

## MAKES THE GARDEN GAY ALL THE YEAR ROUND

Sold everywhere in TINS at 10d. and 1/6; and in BRANDED and SEALED BAGS—7 lbs. 3/6; 14 lbs. 6/-; 28 lbs. 10/-; 56 lbs. 18/-; 112 lbs. 32/- Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except TINS).

Every Genuine Tin, Bag and Seal bears the Trade Mark.

and the plant watered carefully until the new shoots are growing freely.

*Agapetes buxifolia*, somewhat sparse of foliage, is striking, however, with its numerous, bright red, tubular flowers over an inch long. This, too, is one of the older "hard-wooded" plants requiring careful cultivation.

*Prostanthera nivea*, an Australian shrub with narrow leaves, bears beautiful pure white flowers and is not difficult to cultivate. Quite small plants flower freely, suggesting that it would make a useful subject where groups of flowering plants are required for furnishing a conservatory. Like other early-flowering shrubs, outdoor as well as indoor, it pays to shorten the shoots when the flowers are over.

*Tacsonia mixta* is an excellent climber for a warm greenhouse. It is now bearing its long-tubed flowers, with petals of a good shade of pink. Of rampant habit of growth, considerable roof space is required to do the *Tacsonias* justice, but a periodical thinning of the shoots after flowering serves to keep the plant within reasonable limits.

*Aristolochia gigas*, from Guatemala, is remarkable for the size of its flowers. Although smaller than the variety *Sturtevantii*, they are nevertheless, sufficiently large to arouse interest which is, however, somewhat tempered by their vile odour. The spreading part of the corolla is heart-shaped and extended into a long tail, the total length exceeding two feet. The colour is cream, with deep purple blotches merging into a deep purple throat. *J. W. Besant, Glasnevin.*

## THE BOTANIC GARDENS, GEORGETOWN.

THE Botanic Gardens of Georgetown, British Guiana, situated at Vlissingen, at the back of the town, are about 150 acres in extent, exceedingly well-kept and contain many beautiful examples of the indigenous flora, and also a very large number of introduced Palms, trees, shrubs and climbers.

In the north wall of the lodge entrance is a clock, placed there in 1909, with a brass tablet to commemorate Mr. George Samuel Jenman, Government Botanist and Superintendent of the Garden from 1879 to 1902, "to whose knowledge, skill and work the Colony is indebted for the laying out of the garden and the formation of the Herbarium."

Near this entrance is a series of beds and borders largely furnished with such well-known plants as *Cannas*, *Celosias*, *Coleus*, *Codiaeums*, *Acalyphas*, *Cosmos*, *Gaillardias*, *Hibiscus*, *Plumbagos*, *Salvias*, *Sunflowers*, *Lantanas* and *Begonias*, all so luxuriant in growth and profusely flowered as to excite the envy of those who grow these same subjects at home under less favourable conditions. Close by is a meteorological station where accurate and comprehensive meteorological records are kept and sent to various stations throughout the world. The garden is enclosed on this side by an exceedingly fine hedge of the Barbados Cherry (*Malpighia glabra*), which forms a dense, impenetrable barrier, and is covered, at certain seasons of the year, with a multitude of small, Cherry-like berries.

A broad drive, about a mile in extent, runs through the Gardens. On either side are spacious, open lawns, rich with the green of the *Bahamas grass*, and studded with fine specimens or well-balanced groups of a large variety of tropical plants. *Euterpe Jenmanii* is of giant dimensions; it has a clean, shining trunk of nearly 100 feet, and is surmounted with a massive crown of luxuriant leaves. Near here also is a very fine specimen of the Brazilian Royal Palm (*Attalea Cohune*). Amongst the largest native trees, the Cannon-ball tree (*Couroupita guianensis*) is the most striking, with its peculiar, sweetly-scented flower and large, brown, cannon-ball-like fruits hanging on the naked branches well up the stem. Other notable native trees are represented by fine examples of the Crabwood (*Carapa guianensis*), the Balata (*Mimusops globosa*), the Mora (*Dimorphandra Mora*), the Trysil (*Pentaclethra filamentosa*), the Silk Cotton (*Bombax Ceiba*), the Sandbox (*Hura crepitans*), the Hog Plum (*Spondias lutea*), the Long John (*Triplaris surinamensis*), the

Wakenham Lilac (*Jacaranda ovalifolia*), the Wild Cacao (*Pachira aquatica* and *P. insignis*), *Ficus leucosticta* and *Cedrela* sp.

Indigenous Palms are well represented by *Astrocaryum tucuma*, *A. tucumoides*, *Bactris Maraja* and *B. flavispina*, while fine clumps of *Manicote* Palms, *Euterpe edulis* and *E. stenophylla* are to be seen along the upper portion of the central drive, together with magnificent specimens of *Maximiliana regia*.

Starting at right-angles from the central drive are two serpentine drives bounded with avenues of huge clumps of *Chrysalidocarpus lutescens* and, continuing in this direction under very fine specimens of *Pithecolobium Saman*, one reaches the *Ficus* grove containing twenty-five species of *Ficus*, including *F. laevigata*, *F. religiosa*, *F. indica*, *F. Vogelii*, *F. maculata* and *F. Hookeri*.

Several canals, about twelve or fifteen feet wide, run alongside the drives, the surface of the water being thickly covered with *Victoria regia* and *Nelumbium speciosum*. Long stretches of these canals are given over to the *Nelumbiums*, which throw their giant Tulip-like flowers well above the foliage. So plentiful are the flowers that they are gathered by hundreds every morning when in bud, and sold at the local market at four shillings per hundred! The beautiful *Victoria regia*, which is to be seen in many situations, attracts attention by reason of its huge, saucer-like leaves, and large, handsome, white to pinkish flowers.

Around the lakes are fine specimens of the giant Aroids (*Montrichardia arborescens* and *M. aculeata*), the Swamp Fern (*Acrostichum aureum*), the beautiful water Hyacinths (*Eichornia coerulea* and *E. azurea*), and the Water Lettuce (*Pistia Stratiotes*), while in the lakes *Utricularia*, *Nymphaeas* and *Salvinia auriculata* abound.

In the nursery house a fine collection of Ferns is grown, including many species of *Adiantums*, *Gymnogrammas*, *Nephrolepis*, *Platypteris* and *Polypodiums*, while in the so-called Calabash Walk, growing naturally on the trees and shrubs, is a large collection of Orchids, including *Cattleyas*, *Dendrobiums*, *Epidendrums*, *Oncidiums* and *Vandas*.

This by no means exhausts the interesting plants or the attractive features of the Gardens. There are no fewer than eighty-five species of tropical Palms, fifty species of *Codiaeum*, and probably as many of *Hibiscus* in a wide range of colours. *Agaves*, *Ardisias*, *Azalias*, *Bambusas*, *Bauhinias*, *Caesalpinias*, *Clerodendrons*, *Cycas*, *Diospyros*, *Dictyospermums*, *Eranthemums*, *Cereus*, *Euphorbias*, *Eugénias*, *Gleditschias*, *Ixoras*, *Jacobinias*, *Lagerstroemias*, *Monstera*, *Neriums*, *Petreas*, *Poincianas*, *Ravenalas*, *Sterculias*, *Tabernaemontanas*, *Swietenias* and *Psidium* abound, and a most attractive feature is the way in which many of the larger trees and shrubs are draped with such climbing plants as *Antigonon leptopus*, *Aristolochia elegans*, *Allamanda cathartica*, *Bougainvilleas* in variety, *Bignonia radicans*, *Dipladenias* in variety, *Hoya carnosae*, *Stephanotis floribunda* and *Thunbergias* in variety.

Under many of the larger Palms and trees and in the woodland glades the ground is carpeted with the Demerara Primrose (*Asystasia bella*), which throws up its delicate flowers in rich profusion.

Adjoining the Gardens are the nursery and trial fields, some forty acres in extent, under the able direction of Dr. Whittles. Here experiments with many plants of economic value, and especially seedling Sugar canes, are carried out. Formerly new varieties of cane were only obtained by chance variation, now the minutely divided "arrow" or inflorescence of a full-sized cane is laid on the top of rich soil in a wooden tray, the soil having been previously baked to kill all weed seeds. The fertilised seeds germinate in the ordinary way, and when the seedlings are about an inch high, the tiny grass-like plants are transplanted into baskets and eventually bedded out in the experimental grounds. Throughout its whole career, each cane selected for further test is known by a number, prefixed by a letter, indicating the colony of origin. Thus "D" stands for Demerara, so that when a variety gives evidence of exceptional usefulness its history may be traced easily. *W. Auton.*

## USES OF ARTIFICIAL MANURE.

UNDER most conditions it is good garden practice to use artificial manures in such a form as to add to the soil supplies of nitrogen, phosphate and potash; when artificial manures do this they are known as complete artificial manures. It is generally accepted that a complete artificial manure gives an increased yield, provided that the soil which is growing the crop has a fair reserve of organic matter, but that the results are not so sure if the organic content of the soil is low. I do not propose to discuss the question of complete artificial manures further, but rather to discuss the use of artificial manures containing only one kind of plant food for certain definite objects.

Nitrate of soda, or sulphate of ammonia, has for many years been used by gardeners as an aid to fight certain insect pests; for example, Turnip Flea Beetle (*Phyllotreta nemorum*, Linn.). In certain seasons this and allied species are troublesome on germinating Brassicas, and it does most damage in a period when the growth of the seedlings is slow. Under slow conditions of growth the effect of flea beetle attack is that the pest eats the foliage faster than the plants can produce it, with the consequence that the seedlings die, and the grower has to sow again. If an attack of flea beetle be taken in time and a dressing of either of the above-mentioned nitrogenous manures given at once, the seedlings grow faster and are then in the position of being able to produce more foliage than the beetles can eat. A crop in this position can generally pull through.

Another example of these manures being useful as an aid to good crops is in the case of a crop standing still in the spring. Weather in spring is varied in character, and often plants start off well and then stand still; in other words, the crop receives a check. This does not appear to injure some crops. Others suffer badly later in the season by running to seed instead of developing their normal growths. Turnips and Beets are very prone to this habit. A dressing of nitrate of soda will often help development in one of these periods of check. Again, all early crops are benefited by a very light dressing of nitrate of soda. The formation of nitrate is very slow early in spring, and crops often grow much better if nitrate is supplied to them. If the crop has to wait until the soil warms up sufficiently for bacterial action to start, growth is slow, because nitrate formation is dependent upon bacterial action. Even early Peas, which normally can look after themselves from a nitrogenous standpoint, benefit by a small dressing of nitrate of soda very early in spring. Other examples could be given, but more than enough have been given above to indicate that there are special uses to which quick-acting nitrogenous manures can be applied, especially when growth is desired.

To take the phosphatic manures next seems a natural sequel to the above because they are so useful in promoting early maturity. In cold, late districts, the application of superphosphate has a marked effect upon the ripening of a crop. A good example is the Onion crop in the northern parts of Britain. It does not take a lot of skill to grow a crop of Onions in those districts, but the finishing of the crop often tries the skill of the cultivator to the uttermost. The cultivator is helped by at least a week if he uses superphosphate during the growing season.

Again, the use of the same manure is a great aid to root-action in the early spring, and if a very light dressing be given the root-system of a plant will double in a very short period. It pays to apply superphosphate ten days before nitrogenous manures are given because, with a bigger root-system, the plant is better able to use the nitrogen when it is applied. I am inclined to think that for this purpose half-an-ounce per square yard of land gives quite as good a result as three ounces. Half-an-ounce per square yard can, of course, be easily spread if mixed with a carrier first. When only organic manures are used in a garden the crops sometimes suffer from lack of phosphate, and if a dressing of any phosphatic manure be given the crops are much improved.

The value of artificial manures containing potash is not so easy to demonstrate as in the

case of nitrogen and phosphorus. Perhaps the best example of a special use to which potash can be put is in the case of stripe disease of Tomato (*Bacillus lathyri*, Manns and Taub.). Bennett states: "An outbreak of this disease may be controlled and frequently eradicated if the plants be young, by altering the conditions of heat and damping so as to favour more hardy plant growth, and by using sulphate of potash for top-dressing at one ounce per square yard, or watering with a solution of 1 lb in 100 gallons."

Sulphate of potash is often used to correct the over use of nitrogenous manures and to help overfed plants to ward off fungous attacks. In other cases potash is used to delay maturity: this is especially useful in districts having a light rainfall. In such districts owing to the poor water supply, premature ripening is often troublesome. Under such conditions a dressing of potash salt causes the growth of the crop to be prolonged, and an increased crop is the result.

It would appear that certain artificial manures are useful when, under certain conditions, a definite object, apart from the actual feeding of the crop, is in view. Gardeners should remember that quick-acting nitrogenous manures are useful when early or quick growth is desired. They should sharply distinguish the difference between early growth and early maturity because the two are entirely different, and while nitrates favour the former, phosphates aid the latter. Potash delays maturity and is also a great aid in fighting fungous and bacterial plant diseases. *Somerset.*

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 181).

### MISCELLANEOUS ECONOMIC PLANTS.

THE tree locally known as Almond Tree or Almendro (*Terminalia Catappa*) is of East Indian origin, and not at all related to the true Almond (*Amygdalus*), but its fruit is similar in shape and texture. It reaches a height of fifty to sixty-five feet (15-20m.), and is commonly cultivated as a shade and ornament tree. It is not sensitive to the sea breezes. The large leaves are oval, shiny and dark green in colour. The oily, edible kernel is enclosed in a hard, fibrous shell, which is surrounded by a red pulp, commonly eaten by children.

The Cedar or Cedro (*Cedrela odorata*) is the tree known in commerce under the names of Spanish Cedar, West India Cedar, Jamaica Cedar or Honduras Cedar. It belongs to the family of the Meliaceae, and is a close relation of the Mahogany. It is entirely different from the true Cedar of Lebanon, which is a Coniferous tree, but its wood is thought to resemble that of true Cedar in colour and general appearance. This tree has a straight trunk and reaches a height of sixty feet to one hundred feet (18 to 30m.); it has compound leaves with leaflets set in two rows, like *Acacia* and *Logwood*. The wood is soft, light, porous and durable, but it splits easily; locally, it is made into dug-outs and furniture. The wood has a reddish or brown colour, and it has a very pleasant strong scent, which protects it from the attacks of insects.

This Cedar tree is found in none of the Bay Islands except Ruatan, and even there it does not occur in abundance. No wood is exported, but, from the mainland, Cedar logs are shipped with Mahogany to the United States where they are manufactured into furniture, moth-proof chests, cigar boxes, pencils, etc. From the bark of the tree a decoction is made which is said to be used to produce abortion. On the mainland of Honduras grows also a lighter variety of Cedar, of a more whitish colour, which is not found in the Bay Islands.

Several species of Oaks (*Quercus* sp.) are found which differ in the size of the leaves. In Spanish, the small-leaved varieties are called Encino, and the others Roble. These trees are particularly numerous in the savanna-like districts of Bonacca and Ruatan; they do not reach a great size, and the wood is of little use.

\*Fungi and Plant Diseases, by F. T. Bennett, B.Sc., p. 231.

The tree known among English- and Spanish-speaking natives by the name Santa Maria, is very common on all the islands. It reaches a great size, and is the only native lumber used to a great extent in ship-building. It is also used for making dug-outs; it is more durable than either Mahogany or Cedar, but it has the disadvantage of being also heavier. Except for the different leaves, and the fact that it has no spurs whatsoever, the Santa Maria might easily be taken for Mahogany.

A tree known as *Lignum Vitae* is said to grow on the hill sides of Ruatan, but no specimen has ever been observed by the writer. In Central America and in the West Indies the name *Lignum Vitae* is applied to different trees having very hard, durable wood.

The Buttonwood is a small, gnarled tree, with lance-shaped leaves, which is occasionally met with along the sea shore. Its hard, durable wood is sometimes used for house posts.

The Long-leaf or Pitch Pine (*Pinus tenuifolia*, Benth.) known in Central America by the Mexican name of *Ocote*, is found over the larger part of Bonacca and around Port Royal (Ruatan). On account of its abundance on Bonacca, Columbus named this island the *Isla de Pinos* (Pine Island), which name, however, soon afterward passed into oblivion.

The Pine trees are not found at an altitude under 100 feet (30m.) above sea level. They do not grow closely together, and the Pine-ridges often present the appearance of a well-arranged park. The wood is suitable for building purposes, but the islanders claim that it is more advantageous to import Pitch Pine lumber from the United States, as there is no saw-mill in the islands. The larger trees are occasionally used as schooner masts, while the poorer negroes and Caribs use the wood for kindling fires and for illuminating. No use is made of the resin with which the wood is saturated.

The Gumbolimbo, Jifucuite, or Indio Desnudo (*Bursera gummifera*, syn. *Bursera Simaruba*) is a high tree, the branches of which begin to form at a comparatively long distance from the ground. The red bark is very thin and smooth; no epiphytes manage to grow on it, as it is continually peeling off in shreds and sheets like the European Birch. For this reason the tree is called Birch, in parts of the British West Indies. It grows readily from cuttings and therefore is sometimes planted for fences.

The Gumbolimbo sheds its pinnate leaves at the beginning of the year, and then remains for one or two months entirely destitute of foliage; the new leaves begin to appear in April. The wood is soft and white and of no value. On the mainland, the gum from the bark is used as incense on account of its pleasant fragrance. A decoction from the bark is taken as a beverage, and is said to render efficient service in the treatment of skin diseases and other sicknesses; the blossoms may also be used for the same purpose. *Edouard Conzemiuss, 33, Boulevard des Batignolles, Paris.*

(To be continued).

## PUBLIC PARKS AND GARDENS.

DUNSTABLE Town Council has been notified by the Ministry of Health that it will hold an enquiry into its application for sanction to a loan for the purchase of land off High Street North for a recreation ground.

EALING Town Council has received sanction to borrow £20,298 for the purchase of land for permanent allotments and a recreation ground at Northfields.

STOKE-ON-TRENT Corporation has been recommended to accept the offer of the Mossfield Colliery Co., Ltd., to let on a lease of seven years about four-and-a-half acres of land at Longton for a recreation ground.

BRIGHTON Town Council is recommended to make application to borrow £2,200 for laying-out a portion of Patcham Place estate as a recreation ground.

## NOTICES OF BOOKS.

### Carnations for Amateurs.\*

As all who are acquainted with Mr. J. L. Gibson and his work amongst Carnations would expect, a book written by him on his favourite flower would treat largely of the Border varieties; nor would they be disappointed in the work under notice. But, while this is so, the Perpetual-flowering and the Malmaison Carnations are by no means neglected, for the author has enlisted the services of Mr. Laurence J. Cook, with the result that all the types of *Dianthus* are treated by experts who write from their own experience.

While most space is rightly devoted to the two above-mentioned types of Carnations, there are useful descriptions of the most desirable of the *Dianthus* species and hybrids. These are grouped into "Rock Garden Alpine Pinks," and "Border Alpine Pinks." In the very interesting chapter on the garden Pink, full credit is given to Messrs. Allwood Bros., Mr. Douglas and Mr. Herbert for the valuable work they have done in raising beautiful varieties of garden Pinks.

In the portion devoted to what may be termed the Carnation proper, Mr. Gibson advises the amateur to "try his fortune with seedlings of his own raising," and proceeds to offer valuable advice on this interesting phase of gardening. But he, very properly, warns the would-be hybridist that lucky-dips into the welter of seedlings are few and far between, and writes, "A few years ago, one of the best Carnation growers living put down 13,000 seedlings from the highest grade of seed. About ninety of the resulting plants were deemed so good that they were marked to try again. At the end of the second year one Carnation was named, and eventually put on the market, one out of 13,000." Such a statement coming from an authority might well give the amateur pause, but should not dishearten him, because as Mr. Gibson points out, it was an extreme case; his own estimate is that one seedling per thousand is worth naming. But the would-be amateur hybridist should bear in mind that the standard set by Mr. Gibson and most other experts is exceedingly high. A seedling to satisfy them must be superior to all others of its type. If the amateur raises seedlings for his own pleasure and without expectations of producing a First-class Certificate variety he should derive great enjoyment in the process, and obtain some seedlings of sufficient merit for his own purposes.

The book is well printed, and the many illustrations tell their story admirably.

## FRUIT GARDEN.

### FRUIT PROSPECTS.

On all sides there are complaints of the lateness of the season, and what is more to be regretted, the unfavourable weather and the bad state of the ground have caused all garden operations to be delayed. A mild winter following a wet autumn led fruit growers to fear very early development and expansion of fruit buds, but a cold February has effectually prevented precocious flowering, which might have been unfortunate for the fruit grower. Apricots seem to have suffered through the unusual length rather than the severity of the winter. The next thinnest crop appears to be Pears, which promise to give something like half the average yield, yet a moderate crop is sometimes better than a full one, because the fruits grow to greater size, and in this respect make compensation for lack of numbers.

So far as one is able to judge, the outlook generally for other fruits is very encouraging, and this is rendered more probable because the majority of hardy fruits, especially Apples, were failures in 1926. To particularise the principal fruits, Peaches, Nectarines, Plums and Cherries all look very promising, whilst Apples

\*Carnations for Amateurs, by J. L. Gibson. Published by W. H. and L. Collingridge, London. Price 5s. net.

are all that could be desired, and given favourable weather, are likely to furnish heavy crops. Owing to the lateness of wall trees in flowering protection this year seemed almost unnecessary; it is, however best to be on the safe side and cover the trees with a double thickness of netting fastened clear of the wall. This will effectually keep out frost and break the force of cold winds, while at the same time, plenty of air and light will reach the trees. An additional point in favour of netting is that, where labour is scarce, it may remain on the trees night and day until the danger from frost is over. It is too early to estimate the crops of bush fruits, but I think the outlook is promising. Raspberries promise well in length and strength of canes, while Currants and Gooseberries look like giving good yields of fruits. Strawberries vary much in appearance, some plants having suffered much, others but little. The younger plantations, as was the case last season, have wintered best, and with genial weather we may have something like an average yield of these fruits. *F. Jordan.*

## FRUIT REGISTER.

### APPLE WEALTHY.

This very handsome Apple of American origin is well worth planting; the tree is fertile and of clean, compact growth, making a good bush for garden culture.

The fruits are in season from October to November; they are of medium size, round, of very even outline, and striped crimson on a yellow ground. In sunny seasons, they are amongst the most handsome of Apples; the flesh is soft, juicy and of good flavour. The tree, if not a heavy, is a regular cropper.

This variety was raised in America, and has been known since about 1860; it should prove very useful as an early exhibition variety, the fruits being of excellent form and finely coloured. *Ralph E. Arnold.*

## VEGETABLE GARDEN.

### SOME UNCOMMON VEGETABLES WORTH GROWING.

SOME of the rarer vegetables are held in high esteem by owners of gardens, and in some establishments the employer is pleased and gratified when his gardener supplies him with some novelty of which he has never partaken before, or perhaps has never even heard of.

In the vegetables referred to below many are worth growing for their culinary value, apart from their being novelties. As to the real utility of others, the delicacy of flavour or rarity of the subject may appeal to many, but they may not find favour with those who have to prepare them for the table. In this latter connection the first crop referred to, the Chinese Artichoke, may be taken as an example. The tubers are small and require very careful peeling and cooking.

Brief cultural details only are included, and only those vegetables, the seeds or sets of which may be procured without difficulty, are touched upon.

*Stachys tuberifera*, the Chinese or Japanese Artichoke, is a delicious little vegetable which may be boiled, steamed or roasted, and served dry or with melted butter; as a delicacy it may be fried with salad oil. The tubers should be planted about the end of March or the first week of April, nine inches apart, and from four inches to six inches deep (according to their size), in rows made eighteen inches asunder. The crop will grow in ordinary soil that has been dug deeply. No earthing-up is required. Choose a sunny situation for this crop. Lift the tubers in autumn and store them in sand.

Asparagus-Broccoli (*Brassica oleracea botrytis asparagoides*) is none other than selected shoots of either white or Purple Sprouting Broccoli, prepared in a special way. The flower heads are merely cut off, and the tender, Asparagus-like shoots cooked and served separately

with melted butter, in much the same way as Asparagus proper. The flower-heads need not be wasted, but may be cooked separately, or used for making vegetable stews or soup. In this case it is hardly necessary for me to give cultural details beyond stating that seeds of both kinds of Sprouting Broccoli are sown in the open in May to provide heads for use during the following winter.

The Brocco-Cauliflower (*Brassica oleracea botrytis cauliflora*) is a cross between the Broccoli and Cauliflower, first introduced, I believe, and largely grown in Cornwall. Sown in the open in April, it will turn in ready for consumption during the following autumn, just as Cauliflowers are finishing in September and Broccoli are commencing. If sown in the open in September it will be ready for use during the following April and May, when Broccoli are finishing and Cauliflowers barely ready to take their place. The cultural details are the same as those for Broccoli or Cauliflowers. It is a decidedly useful vegetable in any garden. The seeds are only procurable so far as I am aware, from Cornwall.

The stalks of the inner leaves of the Cardoon (*Cynara Cardunculus*), together with the main root of the plant, make a delicate dish when boiled and served with white sauce. The stalks of the inner leaves, likewise, after blanching, become crisp and tender, and may be used like Celery in stews, soups, and salads. The seeds should be sown in specially prepared trenches about the third week in April, one inch deep and eighteen inches apart, in patches of three or four together. When the seedlings are three inches high, thin them to one to a patch. Place a stake to each plant when it is a foot high and secure the leaves loosely to it. In August draw the leaves tightly together, protect the plant with hay or straw, and cover it with soil. About eight weeks later the plants will be found sufficiently blanched for use as above described. Plants may also be raised from seeds sown out-of-doors in May and June, as successional crops, to be earthed up in September for consumption during November and December. Whole plants are thus available for boiling, without blanching and when stripped of their leaves, from August to September only, but blanched stalks and edible roots (cooked separately like Carrots) are available up to the end of December.

The leaves of the Chinese Mustard (*Brassica nigra*, syn. *Sinapis nigra*) are boiled, eaten like Spinach, and have a most agreeable flavour. The seeds are sown in August or early spring, in drills made from sixteen to twenty inches apart. The drills should be watered a few times in summer to assist the growth of the crop.

Chou de Burghley is a most delicious vegetable, a cross between the Cabbage and the Broccoli. If seeds are sown in the open in May and the seedlings finally transplanted in fairly rich, well-drained soil in August to September, the plants will produce medium-sized heads like Cabbage, with a small Broccoli in the centre, ready for cutting the following spring, say, April to May.

If a considerable breadth be grown, some of the Cabbage-like heads which are fully formed without the Broccoli, as early as November, and withstand frost well, make most delicious eating during the winter, when cut and cooked like white-heart Cabbage, more especially when flavoured with bacon or boiled in bacon-water. The culture of the crop is simplicity itself. The plants are treated just like Cabbages, only they prefer rather more generous treatment, and require good, rich soil.

Chou de Russie or Russian Kale (*Brassica oleracea acephala* var.) is a most delicious vegetable, resembling a Cabbage in form, but having curious, deeply-cut, glaucous foliage. In November the plant forms a dense head, from which a profusion of sprouts is produced in early spring; they are very tender when boiled and of a more delicate flavour than Kales. This Brassica is extremely hardy, and its culture is the same as for ordinary Kales, the seeds being sown out-of-doors early in April.

Couve Tronchuda or Seakale Cabbage, which is known as Portugal Cabbage or Portulaca (*Brassica oleracea costata*) is a delicious winter vegetable, and not nearly so extensively grown as

it should be. If seeds are sown in the open early in May, the seedlings should be treated in the same manner as ordinary Cabbage seedlings. The plants are ready for use from November to January. A second sowing made in June will provide a crop for use during February and March. The plants produce good heads and leaves with thick, fleshy midribs. The latter are boiled separately and served like Seakale, while the green, fleshy leaves are cooked and eaten as ordinary Cabbage, after being stripped from the midrib. *E. A. Saunders.*

(To be continued.)

## HOME CORRESPONDENCE.

**The Blue Primrose.**—I was much interested in the article on the above subject (p. 232), but fear the small beginnings of the Blue Primrose are now lost in obscurity. Had Mr. G. F. Wilson put the subject in concrete form as the late Rev. W. Wilks did in the case of the Shirley Poppy, the information would now be valuable, since good blue Primroses have become a reality. The history of the variety Scott-Wilson was what should have been recorded. I well remember the late G. F. Wilson bringing baskets of blue Primroses to the meetings of the Royal Horticultural Society, but he also brought flowers of *Gentiana acaulis* that were purple, as well as blue ones. The old blue Polyanthus was named *Primula elaeagnifolia* caerulea in the early eighties of last century, but it was merely a garden Polyanthus, and not related to *Primula elatior*, with the open throat. Neither had it anything to do with *P. amoena* which appears to have been confused with *P. Sieboldii* from Japan. Some very respectable blue varieties were developed from the latter during the eighties and nineties of last century. One was named Bruce Findlay. What has become of these? They were really attractive plants, hardy and easy to grow. I have had *P. Sieboldii* under my care, and it was reputed to be the parent or origin of the coloured garden Primroses. There seems no need to suppose hybrid origin to account for blue Primulas, since blue varieties have been developed in *P. sinensis*, *P. Sieboldii*, and now in the garden Primrose without the hybridisation of any two very distinct species. Even if the blue Polyanthus had been used in crossing, many modern writers are of opinion that it originated from *P. acaulis*. *J. F.*

**Acidity and Lawns.**—We read with much interest the article which appeared in a recent issue of your journal, entitled, "On Lawns," because our numerous experiments in turf culture give support to many of the views there expressed. The suggestions in your article are, of course, chiefly applicable to turf used for golf, tennis, croquet or bowls, rather than to the "pleasure lawns" which have always been, and are still, such a unique feature of our English gardens and parks. The best and oldest of the latter do contain a large variety of grasses and small Clovers, and to reproduce verdant green turf, soft to the tread, more species must be sown, and they must be encouraged by different treatment and different fertilising than that suitable for sports turf. For quite a number of years we have advocated withholding lime from tennis lawns and golf greens, as we have come to the conclusion that in many cases a dressing of this kind is not in the best interests of the turf. We are compelled to state, however, that much depends upon the character of the herbage present. Some grasses, such as the Poas and *Cynosurus* are lime lovers, and the method of allowing the soil to become acid is not likely to benefit them, so that the treatment to be effective in this case must be accompanied by the introduction of other and more suitable grasses. The *Agrostis* and *Festuca* species appear to benefit considerably from the acid treatment, and as these are without doubt the most desirable grasses for sporting turf, there is much to be said in favour of the method. The conclusion we have drawn from our experiments is that acidity of soil does not lead to any direct increase in the

development of the desirable *Agrostis* and *Festuca* species, but appears to restrain the growth of many other kinds of vegetation. At the same time it must not be forgotten that certain weeds and mosses flourish on acid soil, and if the method advocated in America is to be gradually adopted in this country there is no doubt that the standard of manurial treatment will have to be raised to enable the grasses to prevail against such species. We are aware, of course, that soil acidity prevents the decomposition of organic residues, and the subsequent release of nitrogen. For this reason an artificial dressing is all the more essential. If we may express an opinion on the subject, however, we must confess we are doubtful as to the wisdom of repeated doses of a purely nitrogenous fertiliser, even under the system of continual watering. According to our experience, the application of nitrogen alone—however successful at first—must eventually lead to deterioration in the turf unless supplemented annually by a more complete form of manuring. It is certainly true that species of *Agrostis* are stated to be most successful in America, and to some extent the same is true of British conditions. The fine *Fescues*, however, also contribute largely to some of our best turf, in marked contrast to their behaviour in America. So far, then, as Britain is concerned, a combination of *Fescues* and *Agrostis* would appear to represent the ideal. It is, of course, essential to obtain the correct form of *Agrostis* so highly prized for its dwarf foliage, creeping habit and capability of withstanding hard wear. Unfortunately, this is a matter of some difficulty owing to the extraordinary resemblance the pure seed bears to other forms of *Agrostis*, some of which are rank, coarse weeds that would do untold harm of sown on a lawn. *Sutton and Sons*.

**Seedling Snowdrops.**—As I was one of the correspondents referred to by Mrs. Thatcher on p. 210, it is interesting to me to be reminded that no satisfactory conclusion was then arrived at regarding the seedling of Snowdrops. At one time, I think it was in April, 1925, I sent the Editor a number of capsules, collected here, to prove that Snowdrops did produce seeds, and suggested a trial at Wisley, or Kew, when my friend, Mr. P. Murray Thomson, wrote me suggesting I should make the trial myself, sending me, at the same time, a number of Herefordshire-grown capsules to test with my own. These included seed-pods of both *G. nivalis* and *G. plicatus*, and they were kept on a shelf in the fruit room along with the home-grown ones until September 22, when I de-podded them. There were 180 plump seeds of *G. nivalis*, and 90 of *G. plicatus*, but when I turned my attention to the home-grown capsules, my disappointment was very great, for out of a considerable number of what were, when picked, plump-looking seed-pods, similar to those I forwarded to the Editor of *The Gardeners' Chronicle*, not one seed was forthcoming, nothing but what Mr. Holmes, under the *nom-de-plume* of *Formakin*, called "woolly-looking matter." I cannot attempt to explain this by any other reason than by remarking that our Snowdrops flower very early in the year and are usually in their beauty before the end of January, when few insects are available for pollinating the flowers, but I cannot understand why the seed-pods swell to a fair size if the flowers have not been fertilised. Regarding the Herefordshire-grown seeds, I have also a most disappointing record; they were sown in a box containing ordinary potting compost, the same day they were removed from the pods, and the box stood in a cold house all that winter and spring, but not one germinated. About mid-summer, 1926, I stood the box at the back of a north wall, as someone had suggested that as a likely place for them to germinate, but the Snowdrops of 1927 have come and gone, and still there is no sign of even one tiny seedling. It is possible that very different results might have been obtained had the Snowdrop seeds been sown at once, and not dried off, yet they were quite plump when sown in September. A further examination is taking place this year, and should seeds be found at any time, I will be only too pleased to communicate with anyone interested. *A. T. Harrison, Culzean Castle Gardens.*

## SOCIETIES.

### MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on March 18, the members of Committee present were Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. A. Burns, Mr. A. Coningsby, Mr. J. Cypher, Mr. J. Evans, Mr. A. Keeling, Mr. D. McLeod and H. Arthur (Secretary).

#### FIRST CLASS CERTIFICATES.

*Cattleya Enid alba* var. *Rex*.—A magnificent flower with pure white sepals and petals; lip large, the base almost solid in colour, light maroon. The plant carried nine blooms.

*C. Enid alba*, var. *Regina*.—A fine form, with pure white sepals and petals; base of lip light maroon, slightly veined. The plant carried eleven blooms. A Silver-gilt Medal and Cultural Certificate was awarded in each instance.

*Odontoglossum crispum ashlandense*.—A large flower of good form and substance, white, with fimbriated segments; large, well-shaped lip, with coloured blotch. From R. Ashworth, Esq. A Silver Medal was also awarded.

*Brasso-Cattleya G. V. Llewelyn* (B.-C. Cliftonii *Grand Monarch* × *C. Dominiana*).—A fine flower of good colour; lip rosy purple, with yellow throat. From G. V. LLEWELYN, Esq.

#### AWARDS OF MERIT.

*Odontioda Brewii* var. *Brunette*; *O. Olympia* var. *Magnificent*; *Cattleya Mrs. Ashworth* (Suzanne Hye de crom × *Mendelii* var. *Stuart Low*); *Sophro-Laelio-Cattleya ashlandense* (C. G. Woodhams × *S.-L. ?*); and *S.-L.-C. Anzac*, *Ashlands* var. (parentage unknown). From R. Ashworth, Esq.

*Odontoglossum Temeraire*, *O. Anzac*, *Towneley Grove* var.; *Odontioda Brewii* var. *Distinction*, and *Cypripedium Nephelia* (*Cyclops* × *Lord Wolmer*). From J. B. ADAMSON, Esq.

*Dendrobium Merlin*, *Bolholt* var., *D. Merlin* var. *nobilis*, *D. Leander* (*Thwaitesiae* × *Austin*), *Cypripedium Elidia* (*Elsie II* × *Idiana Lecana*), and *Odontioda Corncrest* var. *grandiflora*. From Captain W. HORRIDGE.

*Cypripedium Hesketh* (Charlotte Dillon × *Hera Mostyn*); *Cattleya Tityrana*, *Llewelyn's* var. (*Tityus* × *Trianae Grand Monarch*), *C. Tityrana*, *Hesketh* var., and *C. Empress Frederick*, *Llewelyn's* var. From G. V. LLEWELYN, Esq.

#### CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Cattleya Enid alba* vars. *Rex* and *Regina*, and *Coelogyne intermedia*; to Mr. A. BURNS, for *Coelogyne Mooreana*; and to Mr. A. CONINGSBY, for *Dendrobiums*.

#### GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group (Gold Medal) that contained *Odontoglossum Temeraire*, *O. Anzac*, *Towneley Grove* var., and *O. Arachne*; *Odontioda Brewii* var. *Distinction*, *O. Princess Mary*, and *O. Viscount Lascelles*; *Brasso-Cattleya The Baroness* var. *Margaret*, *Cattleya Enid alba* in variety, *Coelogyne intermedia*, *Dendrobium xanthocentrum*, *Towneley Grove* var., *Trichopilia sanguinolenta*, etc.

R. ASHWORTH, Esq., Newchurch (gr. Mr. W. Hough), was awarded a Gold Medal for a group of *Cattleyas* and *Brasso-Cattleya magnifica*, *Odontoglossum crispum ashlandense*, *O. Purple Queen*, *O. Hilda*, and *O. amabilis*; *Odontioda Brewii* var. *Brunette*, and *O. Olympia* var. *Magnificent*. Captain HORRIDGE, Bury (gr. Mr. A. Coningsby) was awarded a Silver-gilt Medal for a fine group of *Dendrobiums* in great variety.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), received a Silver Medal for a group including a well-flowered plant of *Coelogyne Mooreana*. G. V. LLEWELYN, Esq., Southport, was awarded a Silver Medal for a group containing *Cattleya Tityrana*, *Llewelyn's* var., *Brasso-Cattleya G. V. Llewelyn* and *Cypripediums* in variety. J. McCARTNEY, Esq.,

Bolton (gr. Mr. C. F. Potts), staged *Dendrobium hybrids*, and *D. linguiforme*.

To Messrs. J. CYPHER AND SONS were awarded a Large Silver Medal for a group of *Dendrobium xanthocentrum*, *D. Apollo alba*, *D. Virgil*, *D. Thwaitesiae*, *Veitch's* var., *D. Wardianum*, *Bifrenaria Harrisoniae*, *Ada aurantiaca*; *Cymbidium* President Wilson, and *Cypripediums* in variety. Messrs. KEELING AND SONS, Bradford, showed *Dendrobium Merlin*, *D. Jamesianum*, *D. atroviolaceum* and *D. Thwaitesiae*. Mr. J. EVANS, Colwyn Bay, sent *Odontoglossum Harryanum* × *Rolfae*, and *Dendrobium plumptonense*. Mr. D. McLEOD, Chorlton-cum-Hardy, showed *Cypripediums*.

### BRITISH MYCOLOGICAL.

At the March meeting of the British Mycological Society, held at University College, London, Dr. G. H. Pethybridge, Vice-President, occupied the chair.

The first paper was by Mr. W. R. I. Cook on the "Influence of Environment on Infection by *Ligniera Junci*." This fungus, which is one of the *Plasmodiophorales*, infects the roots of water and marsh plants. It is especially abundant in the neighbourhood of Sevenoaks, Kent, and an attempt was made to determine the factors of habitat favouring the growth of the fungus. The water was found to be slightly acid, with an excess of iron. Plants were grown in Sach's culture solution with a slight excess in the amount of iron usually employed. Experiments show that water plants grown in the solution can be infected at Ph 5 to Ph 8 when the roots are protected from light by covering them with silver sand, but without this protection no infection is obtained even at the optimum Ph value. Further, infected plants grown in aqueous culture media, without protection of the roots from light, become free of infection in less than three months. The *Plasmodiophorales* are a remarkably uniform group, but a consideration of their responses to physiological factors shows them to be very diverse, e.g., calcium appears to inhibit the growth of *Plasmodiophora brassicae*, the causal organism of finger and toe disease, whereas it seems to stimulate *Spongopora subterranea*, which produces powdery scab of Potatoes.

Miss M. P. Hall followed with an account of "Zonation in Cultures of *Monilia fructigena*." Everyone who has grown fungi on solid media has noticed that some species produce concentric rings characterised by greater or less production of spores. Zonation in cultures of *M. fructigena* is caused by the alternation of bands of aerial mycelium bearing conidia, with regions of flat, sterile growth. The zonation is conditioned by the nature of the nutrient medium, the concentration of which should be such that the non-staling type of growth is given. It is essential that the initial reaction of the medium should be acid unless the constituents are such that the reaction becomes acid as growth proceeds. A synthetic medium (containing glucose and the usual mineral salts) with ammonium chloride as the nitrogen source was found most suitable, although Potato extract agar acidified with .5 per cent. malic acid gave good results. The growth of this fungus is affected by light and darkness. In darkness a thick web of flat surface growth is produced and zonation is completely suppressed if the temperature is kept constant. The aerial type of mycelium is produced in light. Results based on dry weight determinations of the mycelium indicate that a greater amount of mycelium is formed in the dark than in corresponding light cultures. This can be correlated with the fact that the rate of spread, as measured by the diameter of the cultures, is less in the dark and staling occurs much earlier. This staling is most pronounced in neutral media, and can be delayed by increasing the acidity of the medium. Under normal conditions of light and on a suitable medium the zonation is a daily one. Variation in the length of exposure to daylight showed that an exposure of three hours daily was sufficient to cause good zonation. Exposures of less duration gave less intense zones, which were

often incomplete. It was found that artificial light could be substituted for daylight. Measurements of the diameter of the zones showed that they were formed just behind the position of the growing tip at the time when the exposure was made. Cultures kept in the dark and given a daily variation of temperature showed zonation. The position of the zones corresponded to the temperature change. No zonation was produced when the cultures were kept at a constant temperature. The zones produced by this temperature variation, although well marked, were not comparable to those caused by alternating day and night.

To occupy the short time remaining before lunch, Mr. J. Ramsbottom showed a couple of lantern slides which illustrated the (apocryphal) origin of the names "Toadstool" and "Horse-Mushroom."

After lunch, Mr. K. R. Mohendra gave his paper on "Variation in *Sphaeropsis Malorum*." Starting with a single hyphal tip culture, several strains of *Sphaeropsis Malorum* were obtained. Spores from a single pycnidium of one of the strains, on plating out, gave individuals of two distinct types: (1) with black mycelium; (2) with white mycelium. The ratio of these black and white individuals did not keep constant. Thus, in July and August, there were twenty-eight blacks to seventy-four whites, or roughly 1:3, in October the ratio was 1:6, in November 1:22, and in December the black individuals practically disappeared. Spores from single pycnidia of white individuals on plating gave white individuals only. While spores from single pycnidia of black individuals gave mainly black individuals and a few white ones, on repeated culture it was found that the percentage of white colonies obtained from the spores of a single pycnidium increased, although one strain has been obtained which gives only black individuals and has, so far, remained steady in its characters.

The individuals of the white type obtained from spores of a single pycnidium showed considerable variation among themselves. Some were sporing heavily while others were practically sterile. The same was true of the black individuals, as highly sporing to practically sterile white strains could be obtained from spores out of a single pycnidium on the one hand and strains of highly sporing power on the other.

The paper on "Seed Mixtures and the Incidence of Fungal Diseases," by Mr. E. Wyllie Fenton, was then read by Mr. Ramsbottom, in the unavoidable absence of the author. It is, of course, well-known that certain factors contribute towards the incidence of fungous diseases. A plant, like an animal, is more likely to be attacked when the food is deficient in one or more of the necessary elements. On the other hand, it is not always easy to give definite evidence of this. In 1924, a field was divided into five plots and each plot was sown with different seed mixtures; each plot was of equal size. These plots were regularly stocked, the stock carried by each being regulated by the amount of herbage given by the plots, so that each plot was worked under ordinary farm conditions. In addition, a small portion of each plot was fenced off for hay so that a thorough comparison could be made. Different seed mixtures were used. Late in the autumn it was very noticeable that one plot was very yellow in colour, while every hay plot was of the same colour. This could be observed even from the top of neighbouring hills. This yellow colour was due to the presence of a rust (*Uromyces dactylidis*) on this plot and also in the hay plots. Owing to the severe drought the grass which was most evident was Cocksfoot; the proportion of the other grasses present was very small. It was also noted that the Rye Grass in the plot was rusted, but that beyond an occasional plant, Rye was not affected in the other plots. Considering the ground covered by each plant, in June and late in October, it is evident that in the rusted plot the proportion of Cocksfoot was high and Wild White Clover practically nil. In the other plots this was reversed. After the summer drought the rusted plot had far more space bare of vegetation than the other plots.

In the case of the hay of all plots, the tall growth prevented the growth of any surface Clover such as either Wild White or Dutch White. Another point was that the Red Clover had died out the previous year, so that the hay consisted chiefly of grasses.

In the pasture the trouble is lack of nitrogen. The absence of any reasonable amount of Clover (as Dutch White early died out) deprived the grasses of a sufficient supply of nitrogen. The droppings from the stock grazing had not been sufficient to replace the nitrogen taken from the soil and removed in the vegetation eaten. In other plots the high proportion of Wild White Clover supplied the deficiency. The removal of grasses for hay means the removal of considerable quantities of nitrogen, and as there are no Clovers left, it means a marked deficiency. In fact, there was a greater deficiency in the hay area than in the pasture.

Mr. E. H. Ellis then gave an account of "Fungi in Japanese Carvings." Japanese native dress is without pockets and articles in common use are fastened to a girdle by means of a cord with a sort of button or toggle at the end. These toggles (netsukés) are made of wood, ivory or other materials, and are carved to represent matters associated with religion, old legends, natural objects and daily life. Larger fungi are sometimes represented, and those shown included the Matsu-dake (*Cortinellus edodes*), and Shi-take (*Cortinellus Shiitake*) two edible fungi sold in the markets in Japan; *Amanita muscaria*, and a *Russula* with the top nibbled by a snail. *Fomes lucidus* (Reishi) appears not only in Japanese but in Chinese design. It has an association of longevity and happiness, and in China forms the basis of the design of the "jui" sceptres.

The meeting ended by Mr. J. Ramsbottom continuing his series of "Fragmenta Mycologica." First were shown a number of coloured lantern slides of common fungi which had been made by Col. C. T. Green. These were followed by a long series of lantern slides prepared from photomicrographs of Orchid seedlings; a running commentary was made on the divergence of the "symbiotic" and "asymbiotic" interpretations of the facts.

The different papers led to interesting discussions and comments.

### LONDON DAFFODIL SHOW.

APRIL 12 AND 13.—The London Daffodil Show, held by the Royal Horticultural Society, took place on the above dates, at Vincent Square. Many experts considered it the finest Daffodil show ever held; be that as it may, the display was a particularly fine one, exhibits numerous, and the standard of quality very high. Non-competitive displays filled all the space next the walls of the hall, and others occupied positions at the ends of the stages where the competitive exhibits were placed.

Many fine, new varieties were exhibited, and the Daffodil Committee made numerous awards. A notable feature of the exhibition was the brilliant orange colouring in the cups of many new sorts.

The Royal Horticultural Society provides the hall and staging, and the medals awarded at this show, but the cash prizes are provided by subscriptions, the responsibility of collecting and disbursing the various sums being in the hands of Mr. E. A. Bowles, Mr. P. R. Barr and Mr. C. H. Curtis.

### Narcissus and Tulip Committee.

Present: Mr. A. E. Bowles (in the Chair), Miss E. Willmott, Mrs. Brodie, Mr. G. W. Leak, Mr. Peter R. Barr, Mr. W. Poupard, Mr. G. Churcher, Mr. W. B. Cranfield, Mr. P. D. Williams, Mr. H. Backhouse, Mr. F. Secrett, Mr. Alfred W. White, Mr. A. Goodwin, Mr. C. W. Needham, Sir W. Hall, Mr. J. Jones, Mr. Arkwright, Mr. W. F. Copeland, Mr. F. H. Chapman, Mr. F. Barchard, Mr. Charles H. Curtis, Mr. F. G. Hawker, Rev. R. Meyer, Mr. J. W. Pearson, and Mr. Herbert Smith.

### FIRST CLASS CERTIFICATE.

*Mitylene*.—A handsome bicolor *Incomparabilis* of good type. The perianth is white and

the pale yellow, frilled corona has a faint white edge. Shown by Mr. J. L. RICHARDSON.

### AWARDS OF MERIT.

*Holland's Glory*.—This is a very distinct flower. It is a sport from Emperor, and the flowers are fully double, both in the two rows of perianth segments and in the tube. It is sulphur-yellow in colour. Shown by Messrs. L. VAN LEENWEN AND SONS.

*Mephisto*.—A Barrii variety of compact form. The yellow perianth segments overlap, making a rounded flower. The flat corona is fiery orange in colour, rather paler at the base. Shown by Mr. P. D. WILLIAMS.

*St. Egwin*.—A large and shapely *Incomparabilis* of almost self yellow colour. The perianth is broad and rounded, while the corona is cupped and slightly deeper in shade than the bright yellow of the perianth. Shown by Mr. P. D. WILLIAMS.

*Scarlet Perfection*.—A rounded *Incomparabilis* variety which has deep primrose coloured, overlapping perianth segments and a broad, flattened, frilled corona of rich orange colour. Shown by Messrs. R. H. BATH, LTD.

*Therapia*.—This is a handsome bicolor Barrii variety. The rounded perianth is white, and the flattish, yellow corona has a broad, orange-coloured rim. Shown by Mr. J. L. RICHARDSON.

*Turin*.—A splendid Barrii which has a milk-white, rounded perianth, with overlapping segments, and a flat corona with a broad, orange coloured rim. Shown by Mr. P. D. WILLIAMS.

### RECOMMENDED FOR TRIAL AT WISLEY.

*Duddington*.—A very handsome, large Trumpet of rich yellow colouring. The tube is long and lightly recurved. Shown by Messrs. DOBBIE AND CO.

*Kingsley Fairbridge*.—This is a beautiful bicolor Trumpet variety of large size and creamy-white colour. The tube is long, shapely and widely reflexed, and the perianth is semi-transparent. Raised by the Rev. G. H. ENGLEHEART.

*Penny-come-Quick*.—This is a Barrii of very striking appearance. It has a rounded, pure white perianth, and a flat corona which is yellow in the centre and bright orange at the margin. Shown by Mr. P. D. WILLIAMS.

*Pride of the Market*.—An *Incomparabilis* variety of very striking appearance. It is a shapely flower of first-rate type. The perianth is yellow and the tubular corona is of rich orange colour and serrated at the ends. Shown by Messrs. R. H. BATH, LTD.

### PRELIMINARY COMMENDATION.

*Red Sea*.—A bicolor *Incomparabilis* variety which has a primrose coloured perianth and a frilled, orange-coloured corona. Shown by Mr. J. L. RICHARDSON.

### COMPETITIVE CLASSES.

There were only two exhibits of twelve varieties of any Division. The first prize was awarded to Mr. J. L. RICHARDSON, who had particularly good vases of *Galopin*, *Incomparabilis* *Seraglis*, *Kilter* and *Midas*, Barrii varieties, and *Suda*, which received an Award of Merit a week previously. Mr. W. A. WATTS was awarded the second prize, and his chief varieties were *John Evelyn* and *Joker* *Incomparabilis*, and *Phyllis Vansittart*, Trumpet.

Of the three exhibits of twelve large Trumpet varieties, the best was shown by Mr. G. L. WILSON, who had vases of *Earl of Antrim*, *His Excellency*, *Florists' Delight* and several good seedlings. In his second prize exhibit, Mr. J. L. RICHARDSON showed *Master Robert*, *White Dame* and *Golden Flag*. The DONARD NURSERY Co. were third.

The best twelve *Incomparabilis* varieties, shown by Mr. J. L. RICHARDSON, included *Solario*, *Golden Pedestal*, *Whitewell* and *Croesus*. The DONARD NURSERY Co. were second, and they had good vases of *Market Glory*,

Dingo and Festive. Mr. W. A. WATTS was third.

There was no exhibit in the classes for Barrii and for Poeticus varieties. The first prize for twelve Leedsii varieties was won by Mr. W. A. WATTS, who staged several seedlings and Honeymoon, Evangeline and Countess of Southesk; the DONARD NURSERY Co. were second.

The following classes required only six varieties each. The first prize for yellow or lemon-coloured Trumpet varieties was won by Mr. G. L. WILSON, who had a good vase of Florists' Delight, and several seedlings. In his second prize collection, Mr. J. L. RICHARDSON showed Master Robert, Golden Flag and Loyalist. Mr. W. B. CRANFIELD was third. The best white Trumpets were also shown by Mr. G. L. WILSON, whose chief varieties were White Conqueror, White Frost and Beersheba. Mr. RICHARDSON was again second. The DONARD NURSERY Co. had the best of many exhibits of bicolor Trumpets, and they included Jersey Cream, Selina Malone and Herod. Mr. G. L. WILSON was second.

In the class for yellow Incomparabilis, Mr. WILSON was first and Mr. RICHARDSON was second, both with good exhibits. The former included Killigrew, Hospodar and seedlings, while the latter had Croesus and Golden Pedestal of great merit. Mr. RICHARDSON had the best bicolor Incomparabilis; his chief varieties were Great Warley, Whitewell and a seedling. The DONARD NURSERY Co. were second and they had Fortune and Macebearer amongst their vases.

There were no Barrii flowers in Class 12, and in the bicolor Barrii class only the second prize was awarded.

In the class for Giant Leedsii varieties, there were many exhibitors, and the first prize was won by Messrs. H. CHAPMAN, LTD., who had beautiful blooms of Suda, Mitylene and White Sentinel. Mr. RICHARDSON, who was second, also had a good vase of Suda. In the class for small Leedsii, only the second prize was awarded. The Triandrus hybrids was only a small class. Mr. W. A. WATTS, who was first, showed mostly seedlings. Mr. W. B. CRANFIELD was second.

The classes for Cyclamineus and for Jonquilla hybrids were not represented, and there was only one exhibit of Tazetta hybrids. This was a good one and Mr. W. A. WATTS, who had pretty vases of Xerxes and of Glorious, was awarded the first prize. The six exhibits of Poeticus varieties made a good display and most of the flowers were of good quality. Mr. J. L. RICHARDSON, who was first, had good examples of Horace and Matthew Arnold. Messrs. H. CHAPMAN, LTD., were second. Of the two exhibits of Double Daffodils, the better was that of Mr. W. F. M. COPELAND, who had good vases of Rubina, Grape Fruit and Irene Copeland.

#### NEW VARIETIES.

The classes for New Varieties were for open competition, and while they contained many meritorious and interesting novelties, quite a number were mediocre. The class for twelve varieties, raised by the exhibitor, was very interesting, and in his first prize collection, Mr. P. D. WILLIAMS had many exceptionally good flowers. Several were Incomparabilis seedlings of great merit. St. Egwin, which received an Award of Merit, Traboe, Picador and Carveth, three very good Barrii varieties, and Godrevy, a small Incomparabilis with a vividly-coloured corona, were, perhaps, the very best of this collection. Mr. G. L. WILSON was second, and he had Mary Malony, a good Incomparabilis, and several seedlings.

The Rev. W. R. MEYER, Watton-at-Stone, Herts., was first in the class for six varieties, raised by the exhibitor, and he included two very good Leedsii varieties which had coloured tubes. In his second prize exhibit, C. H. CAVE, Esq., Sidbury Manor, Devon, had very good Incomparabilis and Leedsii seedlings. E. T. ENGLAND, Esq., Exeter School, Exeter, was a good third in this interesting class, and he included in Cap and Bells a very uncommonly marked flower.

F. BARCHARD, Esq., Forsted Place, Uckfield, and Rev. J. T. PEARCE, Mayfield, Epsom, who were first and second, respectively, in the class for three varieties, both showed seedlings. There was good competition in the class for twelve varieties, not in commerce. Mr. J. L. RICHARDSON, who was first, included Seraglio, an Incomparabilis and Brighter London, a Barrii, in his exhibit. The best six varieties were shown by Rev. R. MEYER, who had good vases of L. Hulbert and S. Mott, of the Incomparabilis type; E. T. ENGLAND, Esq., was second. Capt. H. S. HAWKER, Ermington, Devon, had the best three similar varieties, and he showed Hafiz, a Poeticus, and Sicily, a large Trumpet. Mr. COPELAND was second.

The first prizes for three varieties and for one variety raised by the exhibitor, were won by J. S. ARKWRIGHT, Esq., Kinsham Court, Presteign, Radnorshire, who had good Incomparabilis seedlings. Mr. F. A. SECRETT, who included Leah and Rachel, which have vivid coronas, was first in the class for three varieties, not in commerce; Mr. R. V. FAVELL, was second and he had Gulliver and Zenno of the same type.

#### MARKET CLASSES.

The best box of Daffodils of any one variety (Division I), as packed for market, was shown by THE PARK FRUIT FARM, Truro, who had a splendid box of the large Trumpet Herbert Smith, a small box containing only eight bunches; second, Messrs. J. T. WHITE AND SONS, Spalding, with a big box of King Alfred.

The best box of Daffodils of any one variety with red colouring, Division II or Division III, was exhibited by Messrs. J. T. WHITE & SONS, Spalding, who showed the fine orange-cupped Croesus in splendid condition; the second prize was awarded to THE PARK FRUIT FARM, Cornwall, for Firetail.

THE PARK FRUIT FARM excelled in the Class for a box of Daffodils, Division IV, with St. Olaf, in which Miss J. EVELYN, Presteign was second with Fawn; and in the Class for a box of Daffodils, Division IX, with Horace, Messrs. J. T. WHITE & SONS being second with ornatus maximus.

Six growers competed in the class for nine market bunches of Daffodils, Division I, twelve blooms in each, staged in R.H.S. vases. The premier award was given to Messrs. J. T. WHITE & SONS, for magnificent blooms of Whistler, Tres-erve and King Alfred; second, Mr. F. A. SECRETT, Marsh Farm, Twickenham, for Emperor Kingsley Fairbridge and Geraldine.

In the similar class for nine bunches, Division II or III, Mr. P. D. WILLIAMS, Lanarth, won outstandingly with superb flowers of Trellan, Gulliver and Penny-come-Quick; second, Messrs. J. T. WHITE AND SONS, with Flame, Croesus and Lady Diana Manners.

The better of two exhibits of three varieties, Division IV, was shown by Messrs. J. T. WHITE AND SONS, their varieties being White Delight, Ettrick and Mrs. A. W. White. There were also two exhibits in the class for nine bunches of Division IX, in which Mr. F. A. SECRETT excelled with Huon, Medusa and Virgil.

#### SINGLE BLOOM CLASSES.

The classes for single blooms numbered twenty, and in most cases, the competition was keen. These individual flowers were some of the best in the Show and in many cases Irish growers were successful.

The following are the first and second prize-winners in the respective classes.

1.a.—First.—Mr. J. LIONEL RICHARDSON, Waterford, with Royalist, a magnificent specimen; second, Mrs. ALFRED WEST, Kileroney, Bray, with Master Robert.

1.b.—This class attracted ten exhibitors: First, Mrs. WEST with Beersheba; second, Mr. F. H. CHAPMAN with Callirhoe.

1.c.—This class also attracted ten exhibits: First, Mr. G. L. WILSON, Broughshane, Co. Antrim, with Queen of Ulster; second, Mr. J. LIONEL RICHARDSON, with a seedling 2/27, a flower with a large white perianth and long, sulphur trumpet.

11.a.—The fourteen flowers exhibited in this class differed widely. The first prize was awarded to Mr. RICHARDSON for Alrvi, a beautiful flower with flat, perfectly formed butter yellow perianth and darker, fluted trumpet; second, Messrs. BARR AND SONS for Vladimir.

11.a. (with red colouring).—Many beautiful blooms were forthcoming in this class, in which the premier award was won by Messrs. BARR AND SONS with a seedling Nx 3602, a flower with a glorious wide, orange cup thrown into bold relief against the well-formed, pale lemon perianth; second, Mr. RICHARDSON with Fortune.

11.b. (without red colouring).—First, Mr. RICHARDSON with Solario; second, Mr. C. H. CAVE, Sidbury Manor, Sidmouth, with Revenge.

11.b. (with red colouring).—First, Messrs. BARR AND SONS with a seedling Nx 4100. The cup is of deep orange and almost crested at the margin and the perianth is ivory; a grand flower; second, Mr. SECRETT with Tolvin.

III.a. (with red).—The best of eight exhibits was shown by Mr. RICHARDSON, who had a choice bloom of Seraglio; second, Mr. WEST with the same variety.

III.b. (with red).—First, Mr. RICHARDSON with King of Clubs; second, Mr. H. G. LONGFORD with Therapia.

IV.a.—This class attracted thirteen good exhibits of which the best was shown by Mr. RICHARDSON in Mitylene; second, Mr. WEST with Suda.

IV.b.—A small class in which Mr. WATTS excelled with Honeymoon and Mr. WEST was second with Samaria.

V (Trumpet shaped).—First, Mr. WILSON with Harvest Moon; second, Mr. WEST with Icicle.

V. (Cup shaped).—Mr. CRANFIELD excelled in this class with a delightful bloom of Venetia; second Rev. G. T. C. PEARCE with Madonna.

VI.—First, Messrs. BARR AND SONS, with a Cyclamineus hybrid named Orange Glory; second, Mr. E. H. C. THURSTONS, Chandlers Ford.

VII.—First, Mr. RICHARDSON with Golden Goblet.

VIII.—Mr. RICHARDSON also excelled in this class with Glorious; second, Mr. WATTS with Xerxes.

IX.—First, Mrs. WEST with Dactyl; second, Mr. WATTS with Horace.

X.—Mr. WATTS excelled in this class with a seedling, B.96, a big flower with clear yellow perianth mixed with shorter orange segments in the centre; second, Mr. COPELAND, Southampton, with Rubina.

#### AMATEURS' CLASSES.

There were nineteen classes in this section, nine of which were restricted to exhibitors who have never won a prize at a Daffodil show under the auspices of the R.H.S., and one open to all for a collection of 36 varieties.

In these classes the first nine were for six varieties in certain sections of the flower, three stems of each sort. Many choice blooms were forthcoming, and taking the section as a whole, it attracted outstanding good exhibits.

The first prizes were awarded as follow:—

Division I.—Miss V. WARREN, Canterbury, for King Alfred Weardale Perfection, Mme. de Graaf, Cleopatra, Monarch and Pride of Kent. Division II.—Mrs. ALFRED WEST with Pilgrimage, Bernadino, Lioba, Croesus, Great Warley and Macebearer. Division III.—Miss WARREN with Greeneye, Fair Maiden, Sunrise, Queen of Hearts, Cossack and Incognita. Division IVa.—Mrs. WEST with Czarina, Mount Erebus, Mrs. Neale, Irish Pearl, Kingdom and Lord Kitchener. Division IVb.—Mr. H. R. DARLINGTON with Evangeline, Diana, White Slave, White Lady, Katherine Spurrel and Queen of the North. Division V.—Mr. REGIN, Ald Harris, Camberley, with Ideal, Elvira, Orange Cup, Triumph, L. Koster and Aspasia. Division IX.—Mrs. WEST with Mr. Arnold,

Socrates, Thetis, Raeburn, Oracle and John Masfield. *Division X.*—Mr. R. HARRIS with Golden Rose, The Pearl, Sulphur Phoenix, Argent, Orange Phoenix and Butter and Eggs.

In the novices section prominent prize winners were Mr. A. W. BELL, New Barnet, Mr. D. ACHESON, Berkeley, Mr. H. A. MARRINER, Little Brompton, and Mr. R. V. FAVELL, St. Buryan, Cornwall.

The collections of thirty-six varieties made a fine contribution to the show, and the quality generally was excellent. The 1st prize was awarded to Mr. J. S. ARKWRIGHT, Kinsham Court, Presteign, Radnorshire, with magnificent flowers of such sorts as Honey Boy, Firetail, Corgi, White Nile, Beersheba, Kestrel, Michael, Red Sundew and Robin Redbreast; second Mr. H. J. MORRIS, Penryn.

The best bowl of Daffodils and the best basket of Daffodils were shown by the DONARD NURSERY Co.; the best vase of Daffodils by Mr. W. A. WATTS, St. Asaph; the best group of Daffodils arranged on a table by Mr. H. R. DARLINGTON; the best R.H.S. vase of Daffodils by Messrs. DOBBIE & Co. who showed glorious flowers of Duddington, and the best R.H.S. standard vase of Daffodils, two varieties, by Mr. W. F. M. COPELAND, who made a pretty vase with the Double Iphigenia and an unnamed Leedsii.

#### GROUPS.

A particularly attractive exhibit was arranged by Messrs. BARR AND SONS. They staged many admirable seedlings, as yet unnamed, especially of the fascinating Leedsii varieties which have Peach, or apricot-tinted coronas. As at the previous show, Messrs. BARR AND SONS staged a goodly proportion of seedling *Incomparabilis* with bold, vividly-coloured coronas and large Trumpet varieties of rich golden colouring. Of their many excellent named varieties we especially admired Nursemaid, The Czar, White Sentinel, Pelican, Sunblaze, Franciscus Drake, Sunny Isle and Gallipoli, of the *Incomparabilis* division; Glory of Haarlem, Dainty Bess and Mrs. J. H. Barr, of the large Trumpets; Firetail and May Blossom, two beautiful Barrii Daffodils Helios and Orange Cup, Tazetta varieties, and Sarchedon, a lovely Poeticus variety.

A large collection arranged by Messrs. R. H. BATH, LTD., was especially rich in *Incomparabilis* varieties. Of these, Orange Delight, Rubini, Scarlet Queen, Pride of the Market, Torrid, Fenland Gem and Isoline, which have vividly coloured coronas, were particularly attractive. Of the many splendid large Trumpet varieties, Citron Queen, a most shapely flower with widely frilled tube, Premier, Monarch, Dawson City and many seedlings were of great merit. Besides the two types above-mentioned this excellent collection included many good varieties of the Barrii, Poeticus, Leedsii and Tazetta types.

In their noteworthy collection, Messrs. J. R. PEARSON AND SONS set up vases of almost all the different types. Of the large Trumpets, Tenedos, Tresserve, Refined Gold and Dawson City were admirable. Chief amongst the many vividly coloured *Incomparabilis* varieties were Milford Haven, Orange Glow, Franciscus Drake, Croesus, Sunrise and Fortune. Firetail, a Barrii variety, and Hera, a dainty little Leedsii, also possessed great charm. In addition to these named varieties, there were also several vases of uncommonly good seedlings.

Along the front of his exhibit, Mr. J. H. BARR had vases of Sweet Jonquil, N. Bulbocodium citrinum, N.B. conspicuus and Queen of Spain Daffodil. These charming little "old-fashioned" varieties attracted a deal of deserved admiration. The decorative little Ladybird was again well-shown. Other good varieties were Croesus, Nanny Nunn, Jasper, Noblesse, Red Riding Hood, Bacchus, Bernardino and Basilca.

In a large collection, the DONARD NURSERY Co. had many vases of large Trumpets and giant *Incomparabilis* varieties. The latter included Farthingale, Dragon, Donax, Market Glory, Croesus, and several good seedlings. The chief of the Trumpet varieties were Gorgeous, Harvest Moon Prospector, Loyalty, King Alfred, Golden King and Water Lily. In addition to those above named, there were attrac-

tive vases of various Barrii, Leedsii and double varieties.

The chief feature of the collection of Mr. J. L. RICHARDSON was several vases of Glorious, a lovely Poetaz variety which bears two and sometimes three large, orange-cupped flowers on each stem. Lady Moore, which has a small Picotee-edged corona, was also particularly attractive. The large Trumpet varieties included many very good seedlings, as well as some named sorts. Amongst the many Barrii varieties were Firetail, Ruby, Dragon and Dorosis.

In a small collection, Messrs. CARTWRIGHT AND GOODWIN had various seedlings and vases of Killarney, Hailet, Phantasy, Magog and King Alfred of the large Trumpets. They also staged some vases of Barrii, Leedsii and Double varieties. Messrs. DOBBIE AND Co. staged three vases of Duddington, a large, rich yellow Trumpet Daffodil.

Beersheba, White Sister and Tenedos, three nearly pure white Trumpet Daffodils, were included in his small collection by Mr. G. L. WILSON. Fairy Circle, which has a flat corona with a narrow margin of orange colour, Fortunei an *Incomparabilis* with a yellow perianth and wide, orange corona, and Hymettus of the same type and with a deep primrose-edged corona, were very beautiful.

The WEST BULB FIELDS Co. had bowls and vases of many decorative varieties. Mr. G. W. MILLER included Bath's Flame, Madame de Graaf, Queen of Hearts, Bernardino and Lord Kitchener in his collection of Narcissi. Messrs. HEWITTS, LTD., had vases of Sunrise, King Alfred, Bernardino, Bath's Flame and Sir Francis Drake.

In a representative collection, Messrs. STEWART AND SON, LTD., had good vases of Tresserve, King Alfred, Brilliancy, Lucifer, Van Waveren's Giant, Primrose Phoenix, Admiration and Soliel d'Or.

## Obituary.

**W. H. Black.**—We regret to record the death of Mr. W. H. Black, of Messrs. James Carter and Co., Raynes Park, which took place on Friday, the 8th inst., after an operation. Mr. Black, who was fifty-four years of age, was apprenticed in the gardens at Haddo House, Aberdeen, the seat of the Earl of Aberdeen. After serving at Haddo House, he went to Broxbourne Park, Dunbar, and subsequently held appointments at Hendersyde Park, Kelso; Scone Palace, Perth; and Boldre Grange, Lymington. Mr. Black joined the firm of Messrs. Carter's in 1911, and he had been serving with them up to the time of his death. The funeral took place on the 12th inst., at Wembleton Cemetery.

**George Brotherston.**—The death of Mr. George Brotherston, Breckenbrough Hall, Thirsk, will be sincerely regretted by his many gardening friends in that district, where he was much respected and esteemed. A native of Kelso, he was a nephew of the late Mr. R. P. Brotherston and also of Mr. James Douglas, both so well known to readers of *The Gardeners' Chronicle*. He worthily upheld the reputation of the family name as a skilful gardener, being especially keen on Carnations, perpetuals and border varieties being his favourites. The Apricot Francis Samuelson was one of his raising, and named after his employer, whom he has served faithfully for well over thirty years. A first-class cultivator of fruit and flowers, and of a kindly, social disposition, ever ready with advice to help his amateur and professional brethren, his passing away will be deeply felt. The respect he was held in was largely in evidence at his funeral in the little village of Danby Wiske, where much sympathy is felt for his widow and family.

**Samuel Neil.**—Mr. Samuel Neil, for fifty-seven years a florist in Dorchester, Massachusetts, U.S.A., died on March 23. The deceased was a native of Cornwall, England, and had worked in the Channel Isles, at Kew and Messrs. J. Veitch and Sons' nurseries previous to settling

in America. He was seventy-seven years of age and left two daughters and four sons; all of the latter have followed their father's business.

**Leon-Louis Gentilhomme.**—We very greatly regret to hear of the untimely death, at the early age of just fifty-three, of M. L.-L. Gentilhomme, general treasurer of the Federation of French Horticultural Syndicates. He specialised in the growing of Heaths, but he took an active interest in all aspects of French horticulture, and was one of the first members of the Federation. He was a municipal councillor of Vincennes, and Officer of the Mérité Agricole.

**Karl Kotte.**—We greatly regret to learn of the death of a well-known German nurseryman, Karl Kotte, of South Berlin, who passed away recently in his seventy-fourth year. In his earlier years he became celebrated for the cultivation of large-flowered Chrysanthemums, Roses and fruit trees.

**Sandu Aldea.**—Rumanian horticulture has sustained another heavy blow in the recent death of M. Sandu Aldea, the Principal of the Agricultural School at Herestrau. Following so soon after the deaths of MM. Stefanescu and Haseganu (see March 19, p. 203), this latest misfortune seems almost too heavy to be borne. It is all the more tragic since a measure is even now before the Roumanian Parliament to raise the school to the status of an Agronomic Faculty, and so set a seal on the pioneer work done by the zealous and indefatigable men who have done so much for Roumanian agriculture and horticulture.

## ANSWERS TO CORRESPONDENTS.

**GARDENER'S NOTICE.**—*B. H.* Notice to quit and to terminate employment must be clear and unambiguous. The words quoted in your letter are not sufficient notice for these purposes, and do not operate to determine the employment or the tenancy.

**NAMES OF PLANTS.**—*L. H.* *Ornithogalum longibracteatum*. *W. M. S.* *Camellia reticulata*. *G. G.* *Pieris floribunda*. *E. C.* *Petasites* (syn. *Tussilago*) *fragrans*. *X. L.* 1 and 2. Saxifrages of the *Burseriana* group, but specimens too small for correct identification; 3. *Gaultheria procumbens*. *Ignoramus*. *Daphne Laureola*. *P. E. D.* *Begonia polyantha*. *Dud.* *Eleagnus pungens aureo-picta*. *R. E.* 1. *Cyclamen repandum*; 2. *Scilla bifolia*; 3. *Chionodoxa Luciliae*. *D.* 1. *Cydonia japonica* var. *Aurora*; 2. *Asparagus virgatus* that has been dipped in aniline dye, and after the ends of the growths have been smeared with gum, they have been dipped in kibbled Rice dyed pink. *Woodcote*. *Tillandsia Lindenii*.

**PALMS WITH PALE FOLIAGE.**—*Fernhurst.* When Palms have thoroughly well filled their pots with roots, they should receive frequent applications of weak liquid manure, with an occasional alternative application of a weak solution of nitrate of soda. Such applications will ensure a better green colour in the foliage, as the light colouring is due to semi-starvation.

**TULIPS DISEASED.**—*W. F.* The Tulips are affected by the "Botrytis" blight, which is caused by the fungus, *Botrytis Tulipae*. An excellent account of this disease is given by Dr. E. F. Hopkins in *Memoir* 45 of the Cornell University Agricultural Experiment Station. The disease has probably been introduced with the bulbs. Since the fungus forms resting masses of spawn (sclerotia), Tulips should not be grown again in the same soil, though other bulbs may be planted.

**Communications Received.**—*W. H. C.* Thanks for 2/6 for R.G.O.F. Box.—*A. C. W.*—*V. B.*—*C. O.*—*G. H.*—*Woolaston*.—*G. S.*—*J. R.*—*K. W.*—*C. O.*—*A. P.*—*C. E.*—*Sir W. E. W.*—*H. H. C.*—*W. A.*—*R. G.*

REMARKS.—White blooms will be in great demand this week end for the Easter festivities, Richardias (Arums) and Lilium longiflorum may advance in price, but supplies at present are fairly good and there is not likely to be any

particular shortage. Similar remarks apply to Carnations and Roses. The weather conditions have checked the supply of Daffodils somewhat, and Emperor is the most prominent and mostly recommended variety. Of Tulips, White Swan and White Hawk should be sufficient for requirements; Scarlet sorts may be the shortest amongst the coloured varieties. Narcissus ornatus, Horace and other special varieties from home growers are a trifle short at present, but fairly large supplies are expected from the Channel Islands together with some outdoor white Tulips from Guernsey. Dutch white Lilac is now practically finished for this season. Single Violets have also finished. Amongst foliage, Smilax is a very short line. Amongst the French Flowers anything really good is gradually becoming short in supply; Double White Stock is fairly good but Star (Allium) may finish this week. The season is also getting well advanced for Anemones; Yellow Marguerites, Marigolds, Carnations and Gypsophila arrive in fairly good condition. It is difficult, indeed impossible, to give correct quotations of prices this week.

REMARKS.—The demand has been fairly active during the week, the Easter trade having been quite up to expectations. Pears, Plums and Grapes from South Africa have been popular and sold very well at slightly improved prices. The first Australian Apples of the season have arrived and sold fairly well. Grapes from Australia also are selling freely. There are still Apples from the United States and Canada available, the best of which sell well. A good demand prevails for the best Oranges from Spain, but inferior grades are difficult to move at a price shippers would consider satisfactory. Although very late in the season there are still some English Apples available, and in spite of the competition of imported Apples, they sell very well indeed. English Tomatoes come along slowly and with more sun the quantities would be much heavier. Cucumbers are a steady trade and will continue so until after the Easter holiday. Mushrooms are more plentiful although prices are only a shade lower. French Beans continue to sell well. Hothouse Marrows also sell freely. Forced Potatoes are easier in price, Spanish New Potatoes being responsible for the lower quotation. Hothouse Grapes, mainly from Belgium, are selling well. Strawberries are not plentiful and prices remain prohibitive for the slender purse. Salads are not so much

Inquired for as is usual during holiday week. The green Vegetable section reports a slightly improved demand. The demand for old Potatoes is still good for best grades.

## GLASGOW.

The tone of the cut flower market was rather better last week, when prices reflected a slight recovery from the low levels previously recorded. Daffodils were in plentiful supply owing to the large quantities arriving daily from Guernsey. Golden Spur sold from 1/- to 1/6 per dozen bunches; ornatus, 1/- to 2/-; Sir Watkin, 1/3 to 1/8; Emperor and Victoria, 1/6 to 2/-; and King Alfred, 2/6 to 3/6. Tulips continued cheap, Clara Bar being worth 4d. to 8d. (6's), Bartigon, Haarlem, William Copland and Couronne d'Or, 8d. to 10d.; Prince of Austria, 8d. to 1/6; Lucretia and Mm. Kreeleage, 9d. to 1/6; Muriel, 6d. to 8d.; and William Saunders, 1/2 to 1/6 (12's). Prices of blue Irises ranged from 2/- to 4/- per dozen, and yellow from 1/6 to 2/6. Carnations realised 2/6 to 4/- per dozen; pink Roses, 5/- to 6/-; red Roses, 2/- to 4/-; Wallflowers, 1/- to 1/6; Anemones, 1/- to 1/6; Hyacinths, 6d. to 10d. per bunch; Lily-of-the-Valley, 2/- to 2/6; Lilac, 1/- to 1/6; Lilium longiflorum (Harrisii), 6/-; and Richardias (Arums), 4/- to 7/-. Marguerites and Spiraeas made 1/6 to 2/- per pot, and Dahlias, Daisies and Sweet Williams, 1/3 to 2/- per box.

Apart from a further decline in the prices of Oranges, dealings in the fruit market were without special features. Jaffa Oranges, 180's and 240's, were valued at 17/- to 19/-; 144's, 14/- to 17/-; Valencia Oranges, 300's, 16/- to 23/6; 240's, 17/- to 24/-; 300's, 8/6 to 14/-; 420's, 20/- to 26/-; and 420's, extra large, 35/-. Prices of Apples also moved in favour of buyers. Winesaps, ex. fancy, being 12/6 per case, Newtown, 11/6 to 15/-; Baldwin, 16/- to 18/- per barrel, and Ben Davis, No. 1, 22/-, and No. 2, 18/-. Prices of Grape Fruit fluctuated between 22/- and 26/-. Melons were obtainable at 1/3 to 1/6 each. Cape fruits were slow to move at 5/- to 7/6 for Grapes, and 4/6 to 6/6 for Plums. Tenerife Tomatoes of first quality averaged 22/- to 26/- per bundle, and other grades made 10/- to 18/-.

In the vegetable section, Cucumbers realised 6/- to 7/- per dozen; Cauliflowers, 3/-; Lettuces, 2/- per crate; Radishes, 2/- per dozen bunches; Endive, 2/6 to 3/-; Spanish Potatoes, 2d. to 2½d. per lb.; and Tenerife Potatoes 15/- per case.

## TRADE NOTE.

READERS requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

## THE WEATHER IN MARCH.

No warmer March than the one recently experienced is on record since the Southport Observatory was established some fifty-six years ago; and, indeed, the month was very nearly as warm as a normal April. The high temperature, however, was largely compressed into one week, extending from the 17th to the 23rd. Winds from all the colder points of the compass were unusually infrequent, the total hours of wind from the semi-circle extending from north-west, through north, to east, being considerably less than half the average. Except around the middle of the month, atmospheric pressure was extremely low. The rainfall was fairly heavy, but the duration of sunshine the normal. Somewhat curiously, the wettest hours of the month were from 8 a.m. to 11 a.m., and the sunniest, twenty-four were from 8 a.m. to 11 a.m., and the sunniest, from 10 a.m. to 12 noon. The mean temperature was 45°, or nearly 4° above the average. Rain fell on 19 days, or an excess of four; and the total quantity was 3.52 inches, or 1.20 inch above the normal. There were, however, over 119 hours of sunshine, or the full average number. Ground frost occurred on eight nights; but, in the screen the temperature was continuously above 32°. A gale from the westward prevailed for 12 hours on the 2nd to 3rd. Hail fell on the 3rd and 11th. February's deficiency of ozone disappeared. Joseph Bazendell, *The Fernley Observatory, Southport*.

## SCHEDULE RECEIVED.

WOLVERHAMPTON FLORAL FETE.—Thirty-fifth show to be held on Tuesday, Wednesday and Thursday, July 12, 13 and 14.—Secretary, Mr. G. W. A. Martin, 46, Queen Street, Wolverhampton.

## BINDING CASES

FOR THE

## GARDENERS' CHRONICLE

We are now in a position to supply our readers with artistic green gilt lettered binders to take a half-yearly volume (twenty-six copies) of the paper.

The special advantage of this binder is that **EACH COPY CAN BE BOUND IN THE CASE AS RECEIVED**; thus the copies do not lie about getting dirty or perhaps mislaid, while waiting to be bound.

The binders are not sent on approval, but can be seen in use at the **GARDENERS' CHRONICLE** office.

Price **5/-** or post free **5/6**

**GARDENERS' CHRONICLE, Ltd.**  
5, TAVISTOCK STREET,  
COVENT GARDEN, W.C.2

## SITUATIONS VACANT

*Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.*

*Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.*

*Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.*

*When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.*

## MUNICIPAL AND PUBLIC.

### CITY OF YORK. PARKS COMMITTEE.

**A**PPPLICATIONS are invited from Gardeners for post of PROPAGATOR, Inside and Out. Permanency. Must understand all classes of bedding stuff, Chrysanth., etc. Wages subject to rise and fall of cost of living index figure. Present wage £3 3s. 8d., plus 4s. for duty. Cottage found at rental of 6s. weekly. Applications, stating age, with copies of two testimonials, on or before the 25th April, to

T. JOHNSON,  
Parks Superintendent.

Guildhall,  
York.

### UNIVERSITY OF LEEDS.

**R**EQUIRED, a supervising GROUNDSMAN with a good knowledge of the care and maintenance of athletic grounds comprising football, hockey, lacrosse and cricket pitches, cinder running track, hard tennis courts, etc. State salary required, with or without free quarters.

Applications should give full particulars of age, experience and references, and should be addressed to

THE REGISTRAR,

The University,  
Leeds.

**W**ANTED, for a public garden, a young energetic FOREMAN for the tree, shrub and herbaceous departments. State age, experience, wages and full particulars.—A. B. Z., Box 49, 5, Tavistock Street, Covent Garden, W.C.2.

### RAMPTON STATE INSTITUTION FOR MENTAL DEFECTIVES, NEAR RETFORD, NOTTS.

**YOUNG MEN** wanted, Inside and Out, take duty. State wages with bothy, send references.—THAYER, Quex Nurseries, Birchington, Kent.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end : if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required : but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week ; but if fully paid, it will appear the following week, unless countermanded in the meantime.*

## PRIVATE.

**HEAD GARDENER** seeks engagement, where medium to large staff is employed. Thoroughly experienced all branches ; married, no family, highest references.—LAWRENCE, The Gardens, Farringdon House, Exeter.

5, Tavistock Street,  
Covent Garden, W.C. 2

## Men wanted by Bakers

1. **ALPINE PROPAGATOR**, preferable a young man from 20 to 25 years of age, and in any case one who has really good experience in the work, has a good knowledge of alpine plants and can produce good credentials.
2. **GARDEN DESIGNER**. Here again a young man is wanted, this time with considerable artistic talent, some experience in garden design and "Ideas." Hitherto gardeners with a flare for design have applied, but with all due respect for their ability, such are not the men we want. Design in garden formation is the first and main essential. When applying for this post, applicants should remember to send available specimens of their work in the form of plans and perspective sketches.

3. **OFFICE MANAGER TO BE**. We also require a well-balanced, keen, ambitious man in mid-twenties, to qualify for the position of office manager. He will more or less have the work of office manager to do at once, but he will not be given the official title or the salary of such a position until he has proved that he is complete master of the work and capable of taking additional responsibilities as and when they arise. We prefer a man versed in the trade, and especially one who has been used to dealing with a large volume of orders and routine correspondence, but it is the MAN that matters, more than the specific trade experience, so long as he has a first-class office training behind him.

All three of these men are wanted as soon as they can be found.

### INSTRUCTIONS TO APPLICANTS.

Applicants should make it clear which post they are applying for, state concisely and clearly what their experience has been, what their age is, what salary they want, and send copies of any business testimonials they may be in possession of. In addition, applicants for the post of Garden Designer should send specimens of their work which will be carefully preserved here and returned to the senders in due course. Envelopes to be marked "Application" at the top left-hand corner.

**Bakers Seed and Flower Farm, CODSALL**  
Nr. WOLVERHAMPTON

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, April 20, 10 a.m. Bar. 30.4. Temp. 57°. Weather, Sunny.

## On Raising New Garden Plants.

THE psychologist—and we are all psychologists now-a-days—may, if cynical, find cause for enquiry why, if gardening be in truth the purest of human pleasures, it should also be one of the most popular. If he were a gardener, however, the answer to the question would be self-evident; for as we all know, the popularity of gardening as a pastime depends first on its precariousness and second, on the diversity of interests which it offers. In most amateur hands gardening has the attributes of a game of chance, and it offers such a vast variety of occupation and interest that the catholic-minded person is apt to prove but a poor practitioner because he is constantly being lured away from one unfinished job to undertake another. The varied interests are so many Sirens whose soft voices beguile all but the most hardened of garden Ulysses. Of the manifold interests which even the smallest garden possesses, one of the

most fascinating is the raising of new varieties of plants. True, it is a game of chance, but one success in a thousand attempts is ample compensation to anyone who is more concerned with pleasure than with profit. The technique of hybridisation is of the simplest, and may be acquired by anyone possessed of a little patience and the smallest modicum of botanical knowledge. The history of British horticulture shows that amateur gardeners have ably and successfully seconded the efforts of the professional hybridists in their attempts to add yet further to the range of variety among garden plants. There are, of course, not a few gardeners—and they are among the best—who are purists in these matters. They would cry, "a plague on both your houses"—both amateur and professional hybridisers. At times all gardeners are purists, especially when they try to devise or undertake the nomenclature of some much mixed up genus of plant—the Rose, for example. But, after all, life has to be explored in all its possibilities, and gardens without hybrids would be as perfectly dull as persons without peccadillos. Of past hybridisers who have left their mark on garden history and on gardens, this country has had its full share in Dean Herbert and Charles Knight, and in more recent times, the Rev. F. D. Horner, famous as a breeder of Auriculas and Tulips; Henry Eckford, who evolved exquisitely beautiful Sweet Peas from a few poorly-coloured, weak-growing varieties; James Douglas, no less famous as a raiser of border and florists' Carnations, and one of the greatest fanciers and raisers of Auriculas; James Kelway, the raiser of so many beautiful Gladioli and Pyrethrums; Richard Dean who, as it were, painted the Primrose; G. Engleheart, whose name is unforgettable when Daffodils are in bloom; and Wolley Dod, whose adept hands helped to make so many hardy garden plants more shapely and more brilliant. These and many other amateur and professional hybridists have done so much that it might seem as though the possibilities of Nature have been exhausted. This, however, is far from being the case, and there are certainly as many hybrid fish in the sea as ever came out of it. In recent years, for example, much has been done with border Carnations, but it is certain that there is much more still to do. Lilies also offer a fair field for the exploration of the hybridiser, albeit that it is doubtful whether fairer forms than those of Nature's making are to be obtained by confounding the substance of different species. But the hybridiser need not confine his work to form and colour. There are plant diseases to be overcome, and the discovery of resistant races is by far the best means of keeping diseases from garden plants. He who could keep a Rose unspotted from the world—banishing black spot from the Rose garden—by breeding resistant races, scented, strong and beautiful as well, would be hailed by everyone—even by the purists—as a benefactor worthy of a wreath of Laurel and of Roses. In this work of hybridisation there is room for all: for the Mendelian who works according to plan and the unscientific "heathen" who works according to chance. The odds of victory are even, and the "heathen" in his blindness of Mendelism is just as likely to succeed, if he possesses the eye for the points of plants, as the geneticist who follows the rules of his game. Yet in the long run, plant breeding will become an exact science and hybridists will all be Mendelians—all working according to plan. For although the results which

are now achieved are precarious, the operations of heredity are certain. Some day they will be understood, and then mankind may be able to direct his own evolutionary course, steering surely through the as yet uncharted seas of progress. And so everyone who achieves anything in hybridisation, even of Primroses or of Carnations, may be adding something to the edifice of knowledge of heredity on the building of which the future of mankind depends.

## Magnolia Campbellii Flowering at Kew.

The flowering of a tree, or to be quite correct a large bush, of this beautiful Magnolia in the open air at Kew is an event of more than ordinary interest. There are number of well-known specimens in the milder parts of the country—at Leonardslee and South Lodge, Horsham, and at Abbotsbury, to name only three—which flower freely in most seasons, but this is the first time visitors to Kew have been able to see fully developed blooms out-of-doors. Two years ago there were several buds on the tree, but frosts destroyed them. The tree in question was one of four small plants obtained from Calcutta in 1904. It is a large, upright-growing bush having no distinct leader, and is twenty-five feet in height. The average rate of growth is about one foot a year. In 1913 it was nine feet high. In its native home of the Sikkim Himalaya, at 8,000 to 10,000 feet altitude, there are records of trees occasionally up to one hundred and fifty feet high. The flowers, produced before the leaves, are large, pleasingly fragrant, and of a rich deep rose colour.

**Markets and Fairs.**—His Majesty's Stationery Office has published the first part of a report on markets and fairs in England and Wales. The Linlithgow Committee, after surveying the whole marketing field stated: "We have been struck by the lack of readily available information regarding the markets of the country. This appears to be due to the fact that there is no general body or legislation on the subject; many markets owe their origin to early charters, others are controlled by local authorities under private Acts of Parliament, while others have been established under the general powers of the Public Health and other Acts. As a result, there is no Government Department which is concerned to consider the relation of local markets to the food supply of the country, their influence on prices, or their general suitability from the point of view either of the consumer or the producer." The Ministry of Agriculture has undertaken a survey of the agricultural markets and fairs in England and Wales in furtherance of this observation of the Committee. The first part, just issued, contains a general review, giving the historical and legal foundations of markets and fairs, and also reviews briefly the statutes and regulations affecting their administration and control.

**Azalea Exhibition in Paris.**—The annual exhibition of Azaleas which is held in Paris in the Municipal Conservatory at Boulogne-sur-Seine, was opened this year on April 15. It will remain open until May 1, and is sure to attract very large numbers of visitors. The fee for admission is one franc on Sundays and holidays, and two francs on other days, the opening day excepted, when five francs were charged.

**Virus Diseases of Potatoes.**—A very interesting and instructive account of the research work in virus diseases of Potatoes, conducted by Dr. Paul A. Murphy and Mr. R. McKay, at the Albert Agricultural College, Glasnevin, is given by Mr. H. Southwell in the April issue of the *Journal of the Ministry of Agriculture*. Mr. Southwell considers that the results of the many years research work on virus diseases point to the fact that the main determinants of productivity of "seed" Potatoes are very closely proportional to the amount of serious virus diseases present in the planted "seed," and that the place of origin in itself is no reliable guarantee

of health and productivity. As the diseases are spread by insects, the factors governing the production of healthy "seed" in any district are (1) the extent to which Potatoes are grown in the district; (2) the introduction of diseased "seed"; (3) the rotation; and (4) the presence of "volunteer" plants. Where Potato growing is congested the area may become, and often is, virus infected. It is no coincidence that the "seed" from the Lowlands of Scotland, from Ayrshire, yields little if any better crop in Lincolnshire than does Lincolnshire "once-grown" (Class 1) "seed," while the best quality "seed" is obtained from those areas in Scotland where Potato growing is not so congested, and where the grower has at least a four years' rotation of crops.

**Formal and Decorative Gardens at Chelsea Show.**—The Council of the Royal Horticultural Society has decided that the judging of the gardens at the Chelsea Show will take place in the following manner:—The scale of points used for formal gardens in 1926 will be used in 1927 for formal and decorative gardens other than rock gardens, i.e. (maximum points): Design, 60; Execution, 20; Plants, 20; Total, 100. In judging rock gardens and formal and decorative gardens, special weight will be given to exhibits in which the design and plants are such as would be practical and permanent for ordinary gardens.

**Iris Society's Show.**—Specialists and other lovers of Irises are already looking forward with pleasurable anticipation to the first exhibition of the Iris Society. This will be held at the Royal Horticultural Society's Hall, Vincent Square, Westminster, on Thursday, June 2 (a printer's error in the *R.H.S. Gardeners' Diary* has made it the Irish Society's show!). The schedule of seventeen classes is now ready and may be had on application to the Hon. Secretary, Mr. G. N. Bunyard, Bower Mount Road, Maidstone. In addition to cash prizes and medals arranged for the several classes, the Veitch Memorial Medal offered by the Council of the Royal Horticultural Society will be awarded to the best exhibit of Irises grown by an amateur; and the Silver Medal of the American Iris Society will, at the discretion of the judges, be awarded to an amateur exhibit. The Dykes Memorial Medal is offered for the best new seedling Iris not in commerce shown before the Iris Society or the Royal Horticultural Society during the months of May and June. Non-competitive exhibits of Irises or of pictures of Irises will be welcomed by the Society, but space must be applied for by May 25.

**Retirement of Professor M. J. R. Dunstan.**—Professor M. J. R. Dunstan, Principal of the Royal Agricultural College, Cirencester, is retiring at the close of the present session. In 1902, he succeeded Sir Daniel Hall as principal of the South-Eastern Agricultural College, Wye, and remained there for twenty years, during which time the activities of the College were greatly extended and the number of students rose from fifty to over two hundred. In 1922, Professor Dunstan was appointed Principal of the College at Cirencester, and in addition he is Professor of Agriculture in the University of Bristol.

**Lamb's Cottage.**—The cottage known as Buttonsnap, West Hill Green, Hertfordshire, has been presented to the Royal Society of Arts in connection with the Society's scheme for the Preservation of Ancient Cottages, by Mrs. M. Grey, Coles, Buntingford. The cottage is referred to in Lamb's Essay, *My First Play*, and is said to contain four rooms with the entrance door so low that those passing through it are compelled to bend their heads.

**Burley Old.**—Lovers of Sylvan beauty will learn with pleasure that the destruction which threatened the beautiful glades of Burley Old, in the New Forest, has been averted. The matter came before the House of Lords, and though some attempt was made to justify the cutting down of old trees, a promise was made by Lord Clinton to the effect that there would be no further vandalism, and any future wood-felling would be carried out only after

consultation with a committee representing the National Trust, the Commons Preservation Society, the verderers and others interested in maintaining the beauty of all parts of that great national heritage, the New Forest. Lord Clinton, representing the Forestry Commission, confessed that in such cases as this "the care of the picturesque overrides all other considerations."

**Mr. Donald MacIntyre.**—Mr. D. MacIntyre is in charge of the great estate of the Damon family, Moanalua, at Honolulu. His father was a very noted Scotch gardener, long in the service of Sir Charles Tennant, The Glen, Innerleithen, Peeblesshire, and a frequent and very successful exhibitor at the shows of the Royal Caledonian Horticultural Society at Edinburgh twenty-five years ago. He retired in 1907 and went to live with his son in Honolulu, where he died in 1918. After serving at The Glen under his father, Mr. Donald MacIntyre went to Drumlanrig, under Mr. David Thompson. He left Drumlanrig in 1892 in order to attend the four-year course of instruction for gardeners

MR. DONALD MACINTYRE.

and foresters that the late Professor Sir Isaac Bayley-Balfour inaugurated in connection with Edinburgh University: while attending the lectures in connection with that course he was employed at the Botanic Garden, in charge of the Orchid collection. In 1897, Professor Balfour sent Mr. MacIntyre out to Honolulu to take charge of the Damon Estate of Moanalua. Moanalua is an estate some nine thousand acres in extent, and it was bequeathed to the late Mr. S. M. Damon by Berenice Pauahi, a chief-tainess who was the last of her line. Mr. Damon developed the estate, sunk wells and installed a system of irrigation. Moanalua has now 2,300 acres of forest, 3,500 acres of pasture land, 400 acres under Pineapples, 2,000 acres of Sugar cane, 441 acres of fish ponds, 116 acres of Rice and Bananas, 40 acres of garden, and a golf course of 76 acres. Orchids, excepting *Odontoglossums*, for which the climate is too warm, are grown extensively, flowering and ornamental trees are a feature of the garden and pleasure grounds, while many tropical and some sub-tropical fruits are grown in quantity. Moanalua is thrown open to the public, and both visitors to Honolulu and residents take full advantage of the privilege. An account of this wonderful estate appeared on page 92 of *The Gardeners' Chronicle* of July 31, 1926.

**Export Duty on French Vegetables.**—By a decree dated the 14th of March, the export duty of ten per cent. ad valorem on fresh vegetables from France, which was imposed by the French Government in July, 1926,

has been replaced by a duty of two francs per 100 kilos weight. It is thought that the taxation by weight instead of by value may simplify matters, and avoid disputes between exporters and customs officials: but it appears to be giving rise to some dissatisfaction on the ground that the duty may in some cases work out at a higher rate under the new conditions than under the old.

**"Journal of the R.H.S. Gardens Club."**—The Volume for 1926 of the *Journal of the R.H.S. Gardens Club* is full of interesting matter on the Wisley Gardens, and although most of the paragraphs are of special interest to present and past members of the R.H.S. Garden staff, both at Wisley and Vincent Square, the *Journal* will be read with interest by gardeners generally. Mr. J. Wilson gives an interesting resumé of Wisley from 1911-1926, covering the period of his association with these famous gardens. Mr. Wilson's account shows that great improvements and additions have been made at Wisley during the past fifteen years. The frontispiece of the *Journal* depicts the beautiful gates erected to the memory of the Rev. W. Wilks. Mr. L. B. Creasey has contributed an interesting article entitled "British Plants in the Rock Garden—Some Observations," from which it will be seen that considerable number of native plants are suitable for our rock gardens. In the personal paragraphs the members of the Club are kept in touch with what many of their old Chiswick and Wisley friends are doing, and it is interesting to learn that some of the old students have sought fresh woods and pastures new, for we learn that Mr. P. Jelly is leaving to be a plumber, Mr. A. Barnes has gone into the cabinet-making trade, Mr. H. Shergold has secured an appointment with Messrs. Unwin, printers, and the Rev. F. A. Phillips has been appointed assistant priest at Puttenham; the majority, however, have remained faithful to their calling, and there is a list of appointments covering a wide field, some of the old students and employees becoming head gardeners, some engaged in nurseries, others have joined experimental stations, and forestry institutes, while still others are trying their fortune in the colonies and places abroad.

**Repairing the Glasshouses at the Botanic Gardens, Regent's Park.**—We learn from the *Quarterly Summary* of the Royal Botanic Society of London that repairs to two of the old glasshouses at Regent's Park have been completed, namely, the Victoria Water Lily House and No. 6, and work on the propagating house in the yard behind the potting shed is now in progress. The sum subscribed by the Fellows for the purpose has already been expended, and the Council is appealing for further donations to repair houses No. 3 and No. 4. The Victoria Regia house was renovated, section by section, and new iron supports fitted inside to strengthen the structure. It was found possible to rebuild the roof without completely dismantling the whole structure. The plants have now been replaced in this house and are expected to provide a fine display in the coming summer.

**Botanic Gardens for Canada.**—Botanists throughout the world, and especially those of Canada and Great Britain, have long desired the establishment of one or more botanic gardens in the Dominion of Canada. So far, with the exception of a small establishment in connection with the University of British Columbia, Canada does not possess a botanic garden, but there are grounds for hoping that in the near future the missing link will be provided in the chain of botanic gardens throughout the British Empire. Dr. Hill, the Director of Kew, visited Canada in 1926 and discussed with the President of the University of Toronto, Sir Robert Falconer, the possibility and suitability in Toronto of a botanic garden in connection with the School of Botany. This discussion is referred to by Sir R. Falconer in his presidential report for 1925-6 as follows:—"In an annual survey it is only right that mention should be made of the special needs of the University. Of all the departments, Botany is that which has been

waiting longest for better equipment. For many years the great need of a botanic garden for this University and Province has been emphasised. In the neighbourhood of Toronto a suitable site may be obtained in which the national treasures can be displayed and their economic possibilities set forth. Recently, the Director of the Royal Botanic Gardens at Kew has visited the city, and once again it has been brought to our attention that such a garden is a necessity for the study of native vegetation, the preservation of native flora, and the promotion in the Dominion of economic developments similar to what has been so effectively done for years by Kew Gardens."

**Cardiff Fruit and Potato Trade.**—At the Annual Conference of the National Federation of Fruit and Potato Trades' Associations, held in the Cathays Park, Cardiff, on the 29th and 30th ult., Lt.-Col. D. Watts Morgan stated at the annual banquet that fruits and Potatoes came second in Cardiff's trade and Cardiff was now almost the largest, if not the largest, centre of these products for Great Britain. The Lord Mayor of Cardiff, Alderman William Grey, J.P., stated that the growth of the fruit trade of Cardiff during the past few years had been very rapid, showing an increase of from fifty to seventy-five per cent. over that of 1913, and more fruit was consumed per head in South Wales than in any other part of the country. Their city was, he said, the first port in the world for the importation of Potatoes, and during last year no fewer than 68,622 tons had been dealt with. Arrangements had been made to import Oranges direct from Jaffa, with the result that the public had received a plentiful supply of Jaffa fruit at very moderate rates.

**Appointments for the Ensuing Week.**—**MONDAY, APRIL 25:** Harrogate and District Horticultural Association's meeting. **TUESDAY, APRIL 26:** Royal Horticultural Society's Committees meet (two days); Cornwall Spring Flower Show (two days); Southampton Royal Horticultural Society's show (two days); National Auricula and Primula Society's show (two days), at the Royal Horticultural Hall. **WEDNESDAY, APRIL 27:** Sheffield Chrysanthemum Society's meeting. **THURSDAY, APRIL 28:** Paisley Florists' Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Sikkim Rhododendrons.*—We regret that Mr. Masters should have published his unsuccessful attempt at cultivating these beautiful plants. His statement, by investing their treatment with imaginary difficulties, is calculated to deter many from persevering in their culture, as well as to prevent others from attempting it altogether. The mishaps of which he complains, and which he would have your readers believe are inseparable from any attempt to grow them, have arisen, not from any insurmountable difficulties, naturally arising therefrom, but from some injudicious mode of treatment, of the nature of which we cannot, of course, venture to speak. When the seeds were distributed we, too, were favoured with a full collection of the kinds, and we have not experienced more difficulty in raising, or in cultivating them, than is usually met with in the common kinds under artificial treatment; in fact, we have been highly successful with the whole of the species. Many of our plants are from nine to twelve inches high, with leaves from six to ten inches long, by three or four inches broad; setosum and the other small mountain species, which Mr. Masters believed to "pine for their mountain air and pressure of snow," are growing luxuriantly with us in a damp, close frame; many of the plants are from six to eleven inches high. Every person who has had much experience in raising *Rhododendrons* and allied plants from seed, must know that very great attention is required when in their young state; a large amount of moisture, a cool temperature, with shelter from the sun and wind are indispensable; and that if these conditions are not artificially supplied, total failure will often result; and, as before observed, we have not, in our experience with the *Sikkim Rhododendrons*, found the attendant difficulties greater than with the most

ordinary kinds. If a variation of treatment is required it is in the form of richer soil, and a greater amount of moisture during their growing period. The following hints will, perhaps, be found useful to those who possess plants, and who may be desirous of succeeding in their cultivation. Procure some very rich peat; it will be necessary that it should contain a large amount of vegetable matter, and mix with it about one-fifth sand. Place a layer of the compost in a frame, about six inches deep, for the reception of the young plants. They should be planted from three to six inches apart, according to the size they have already attained. Here, during their growing season, they must

be stuck around them to afford a partial shade. They will require a very rich soil, with a moist subsoil, but not such as arises from stagnant water. Where situations are prepared for them, they should be drained from two to two-and-a-half feet deep. It will be of no use placing them in dry borders. Old ponds, drained and filled up, or bogs surface-drained, will be the most suitable place for them. Judging from our own experience, we believe that the greater part of them will be quite hardy. But should some of them not prove so in the midland counties, there are many places in Cornwall, on the western coast of England and Scotland, and in Ireland, enjoying a very humid atmos-

FIG. 135.—*ODONTOGLOSSUM MURALIS*, GERRISH'S VAR.  
R.H.S. Award of Merit, April 5. Flowers red-brown, lilac, chocolate-red and white.  
Shown by Mr. R. Gerrish, Millfield, Salisbury. (see p. 255).

be kept very damp, saturated, in fact, and well-shaded from the direct action of the sun. Many failures have occurred from exposing them to a hot, dry atmosphere. When they are of sufficient size to place in the open air (which should not be done till they are at least a foot high), August will be the best month to choose for the operation. Of course, they will have been gradually inured to the change before their final removal. Advantage should be taken of a rainy time for planting, and if the weather is afterwards hot and dry, a few boughs should

be placed around them, where they will succeed well. *Standish and Noble, Bagshot, Gard. Chron., April 24, 1852.*

**Publications Received.**—*Flora of West Tropical Africa*, by J. Hutchinson and J. M. Dalziel, Vol. 1, Part 1; Crown Agents for the Colonies, 4, Millbank, Westminster, S.W.1; price 8/6.—*The Manuring of Orchards and Fruit Trees*; free on application to the Chilean Nitrate Committee, Friars House, New Broad Street, E.C.2.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Cattleyas and Laelio-Cattleyas.**—These Orchids need to be repotted at different seasons of the year. Those plants which produced their flowers during the late autumn and winter have enjoyed a considerable period of rest, and show signs of developing new roots. Any plants in need of fresh rooting-material may receive attention, for the present time is the most favourable season for repotting them. *C. labiata*, *C. Percivaliana*, *C. Trianae*, and *C. Dowiana* are the principal species which will need attention first, to be followed at a later date by *C. Schrödera*, *C. Mossiae* and *C. Mendelii*. The repotting of the later-flowering species, *C. gigas* and *C. Gaskelliana* should be deferred until just after they have flowered. The many hybrids include several that produce their flowers during the winter and, like the species mentioned above, start on their new cycle of growth at this season. Vigorous plants that only require potting because they have outgrown their receptacles, should be taken out of the pot carefully, thoroughly cleansed, the old, leafless, pseudo-bulbs removed, the decomposed material carefully picked out, and then be placed in the smallest receptacles that will accommodate them. Plants which show signs of deterioration should be carefully pulled apart and placed in the smallest pots that will hold them. Deterioration of these plants is often caused by the loss of roots from too much or too little water, and I have known many plants deteriorate through being watered with unsuitable water; rain water is the most satisfactory to use.

**Potting Cattleyas and Laelio-Cattleyas.**—There is a great diversity as regards the rooting behaviour of the different species and members of these large families of Orchids. Some make large, strong roots, whilst others have small and wiry ones; the former are generally strong, robust growers, such as *Laelia purpurata* and its hybrids, whilst the latter comprise such as *Cattleya Dowiana*, and plants of a similar nature which are often regarded as difficult to grow. These weaker growers should always be given slightly more drainage, and grown in smaller pots than those of a more robust nature. Strong, healthy specimens, under proper treatment, should not require further repotting for at least two years, hence the necessity of the work and the material being of the best.

**Compost.**—A suitable compost for these plants consists of equal parts *Osmunda* fibre and A.I. fibre, to which a small quantity of *Sphagnum*-moss may be added, all thoroughly cleaned, and used in as rough a state as possible. In a compost of this nature, the plants should be potted firmly, as when potted loosely the compost will soon decay, and with it, the roots, this in most cases being the cause of the plants deteriorating, as they resent decayed rooting material more than any other Orchids. Water should be applied to the new compost with extreme care until the roots are established in it, but frequent dampings between the pots will be of great benefit to the plants. It is also advisable to shade the plants for some little time after repotting them to prevent the foliage losing colour and also the loss of leaves.

**Propagating Dendrobiums.**—To maintain a healthy stock of these Orchids, it is advisable to propagate the choicest varieties at every opportunity, and this is best accomplished by cutting up the old pseudo-bulbs removed from the plants when repotting them. Dibble the portions in pots of clean silver sand, and place them in a warm propagating frame, where they will soon form growths, which, when making roots, may be placed in small pots, and grown on in the same way as the older plants.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Primula sinensis flore pleno.**—The old double white *Primula* is now rarely grown in gardens, although it makes a fine greenhouse subject. The plants are passing out of flower and should be prepared for propagating, as this variety does not produce seeds. Commence by removing the bottom leaves, after which a slit should be made with a sharp knife in an upward direction in each division, and the cut kept from closing by placing a small piece of crock or charcoal in it. The plants should then be packed around with *Sphagnum* moss or fibrous loam, filling in the centre with leaf-mould and silver sand, to encourage young roots to form. The plants require careful watering at this stage, and shading from bright sunshine. When it is found that the top-dressing is well-filled with roots, divide the plants carefully and pot the portions singly in small receptacles. Those that have formed plenty of roots may be stood on a moist base in a cool house, while those that have not made many roots should be placed in a propagating frame for a few days; guard against damping, for this *Primula* resents a close atmosphere.

**Euphorbia jacquiniæfolia.**—Stock plants of this beautiful and useful *Euphorbia* should now be introduced into heat to develop suitable shoots for making cuttings. Plants that have been treated as previously advised will produce shoots suitable for use as cuttings in a very short time, and when the young growths are about three inches long they may be used for this purpose. They are best taken with a heel of the old wood, and immediately they are severed with a sharp knife they should be placed in an upright position in powdered charcoal to prevent bleeding. The cuttings are best taken early in the morning, before the sun gains too much power, and the receptacles should be prepared in advance in order that the cuttings may not flag in the least degree before inserting them in a sandy, open compost. Root the cuttings in a warm propagating frame. If it is intended to grow them on as large specimens insert three cuttings in a small pot. The plants may then be grown on without any unnecessary disturbance at the roots. This *Euphorbia* delights in a stove temperature until it is well established in its flowering pot, after which it may be grown in cooler conditions. The roots need careful watering at all times, and they should never be allowed to become excessively dry. *Euphorbia pulcherrima* (syn. *Poinsettia*) requires much the same treatment as advised for the above.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Frame Melons.**—The present is a suitable time to prepare for the growing of Melons in frames, with or without hot-beds. Ripe Melons cannot be produced in frames in less than twelve to fifteen weeks; they should be forthcoming from the end of July to the end of September, which includes the hottest period of the year, plenty of solar-heat and light being essential to success with this crop. Assuming that stable manure and leaves can be used in equal parts, the heap should be turned two or three times and the bed made as recommended in a previous calendar. The most suitable compost for Melons is a somewhat heavy loam mixed with old lime rubble and a little soot to destroy wire-worms, adding a little bone-meal if the loam is of poor quality. In a good compost, and with careful attention, the plants will grow rapidly. A small amount of fresh air should be admitted until a maximum temperature of 85° is reached, and then gradually reduced as the temperature falls. When the frames are closed and contain plenty of atmospheric moisture, the temperature may be allowed to rise to 90°. As the shoots reach the limits of the frames, stop them, to cause laterals to develop, on which fruits will appear at the first joint. When several of the flowers have expanded, pollenate them until sufficient fruits and to spare have set, finally

leaving three or four to each plant. By this method and constant pinching of the laterals, the larger leaves will have plenty of room, and sun light and warmth will reach the bed and prevent stagnant conditions in the soil, with the result that canker will not be likely to affect the plants.

**Cherries.**—The earliest fruits will soon be past the stoning period, but the temperature of the houses must not be allowed to rise too high, 50° to 55° at night, and 65° to 70° by day, with bright sun, being sufficient; maintain a sufficient amount of atmospheric moisture. Keep a close watch for weevils, which will do much damage to both fruits and foliage in a very short time. Black and green aphides are sometimes very troublesome to Cherries under glass, and two or three fumigations between the stoning and colouring periods are advisable; it is not wise to fumigate after the fruits have coloured, as the flavour is liable to be affected by the fumes. Cherries will hang for a long time after they are ripe, provided the atmosphere of the house is kept cool and dry.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Strawberries.**—Where the soil is naturally well suited to growing Strawberries, excellent crops of fruit may be obtained from the same plants for at least three or four seasons in succession, but if the soil is of a light, hungry nature, resting on a gravelly subsoil, two years is quite long enough to expect satisfactory crops of good-flavoured berries. Plants raised from layers taken from healthy stock in July usually produce good crops the following season, and if planted on a warm border the fruits will be not only large but ripen quite ten days before those fully in the open.

**Forced Plants.**—Where it is the practice to make new Strawberry plantations by utilising plants that have been forced in pots, the ground, if not already prepared for them, should be got in readiness and the plants put out so soon as they are ready, in deeply worked soil that has been enriched with plenty of manure. Do not retain the plants longer in their pots than is necessary after they have been hardened. Set them two feet apart, but before doing this, soak the balls of soil and roots thoroughly with water. Shake away much of the old soil and plant firmly. In old gardens it is a good plan to work a few handfuls of sweet, well-prepared compost around the roots of each plant.

**Vines.**—So soon as outdoor vines have made a couple of inches of new growth, all the laterals, with the exception of one or two, should be rubbed off each spur. Select the best placed and most promising shoots for fruiting. As the growth extends and the bunches show, pinch the laterals at about three leaves beyond the bunch. Later, when the berries are well set, reduce the number of bunches, if necessary, leaving the best ones to constitute the crop. The berries should be thinned when very small; as Grapes in the open do not grow very large or ripen early, they should be well-thinned and encouraged to ripen so soon as possible.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Potatoes.**—The planting of Potatoes should, by this date, be well advanced, though the work may be done with success for a considerable time longer. So soon as the tops of the earlier planted ones are discernible, advantage should be taken of dry weather to well fork the ground, working in at the same time a liberal dressing of soot. All will then be in readiness for earthing up the rows when the haulm is sufficiently advanced for this to be done.

**Staking Peas.**—When this work is being done care should be taken not to close the sticks together at the tops, an evil which prevents the free branching of the shoots. The grower

should allow at least as much space in that position as at the base.

**Celery.**—So soon as ground becomes vacant, the trenches for this crop should be prepared. Plenty of well-rotted manure, cow manure for preference, should be dug into the bottom of the trench and well mixed with the soil. For a double row of plants the width of the trenches should not be less than eighteen inches, and a distance of six feet should be allowed between the trenches. If slugs or other pests have previously caused trouble, the ground should be dressed with a soil fumigant or sprinkled over with kaintit. The ridges between the trenches may be utilised for growing Lettuces, Turnips, or any crop that will mature before it is necessary to use the soil for earthing up the plants. Strong plants, raised early, should now be hardened gradually in readiness for planting in the trenches by about the third week in May.

**Cucumbers.**—If Cucumber seeds are sown now in small pots and placed on a hot-bed or in a house where a temperature of 60° to 65° is maintained, they will soon germinate and grow quickly into strong plants, suitable for setting out on hot-beds in frames by about the third week in May. At this time growth will soon become rapid, and care should be taken to train the young growths thinly. Pinch the points of the shoots when they are advanced sufficiently, and the laterals at the joint beyond the fruit. Make full use of sun-heat, and treat the plants as advised for those growing in houses. Later in the season good Cucumbers may be grown successfully in frames without the aid of artificial warmth; for instance, in frames in which Potatoes have been grown, a mound of rich, loamy soil, to which a little old Mushroom-bed manure is added, will be all that is necessary for a start. Close the frame early with plenty of atmospheric moisture. On cold nights cover the lights with mats.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Snowdrops.**—Where it is desired to naturalise Snowdrops to extend the planting, or, in fact, to move them at all, there is no doubt that the best time is when they have finished flowering or just before the foliage dies down; with home-grown stock this is fairly easy. If the plants are purchased, try and secure delivery as soon as possible after they are lifted. Snowdrops succeed best in fairly open woodland, where the soil is loose and free with plenty of humus. They do best in grassy places where the surface is soft and spongy, as opposed to close, lawn-like conditions. They may also be grown in large beds of deciduous shrubs, and also naturalised in the hardy fernery.

**Chionodoxas and Scillas.**—*Chionodoxa Luciliae* C. *sardensis*, *Scilla bifolia* and *S. sibirica* are all beautiful, small, blue-flowered bulbous plants that are ideal for naturalising in the rock garden, hardy fernery, under deciduous shrubs, or even in Rose beds, where they make a fine display in early spring. They all increase freely in light, warm soils. In common with all early flowering bulbous plants, they should be planted so soon as possible.

**Spring-flowering Bulbs.**—Early Tulips, Hyacinths and Narcissi occupying beds required for summer bedding plants should be lifted carefully after they have flowered, and the bulbs laid in a bed of ashes or light soil until the foliage has ripened completely, when they should be lifted and dried off in a suitable store room. Tulips are all too commonly affected with disease, and all affected bulbs, also the soil surrounding them should be removed so soon as the diseased condition is noticed. When lifting the bulbs from the beds a close watch should be kept for diseased bulbs, which should be burned, for once the soil is infected it is useless to try and grow Tulips on the same ground for a number of years, as the resting spores or sclerotia of the fungus will remain dormant in the soil for at least eight years, and a few diseased bulbs will infect the whole bed in the following year.

**Evergreen Hedges.**—Hedges of Holly and Yew are best planted towards the end of April or beginning of May, just when the plants are starting into growth. The sites should have been well prepared sometime previously; firm planting is very important and the roots should be well-watered if drying winds prevail. *Cupressus macrocarpa* is often used for an evergreen hedge, but with much trimming it often has a tendency to die in patches. *Thuja gigantea* makes a very good hedge and is sometimes planted as a large, informal screen, as also is *Cupressus Lawsoniana*. *Prumnopitys elegans* makes a beautiful hedge, but I only know of one example of it; its lively green colour is much more cheerful looking than Yew, and I see no reason, if stocks were available, why it should not be generally used for forming hedges. There are many other plants that are neglected for this purpose, *Berberis stenophylla* and *B. Darwinii*, for example; there is a fine hedge of the former surrounding the water garden at Kew; such a hedge should not be trimmed with the shears, but simply the longest shoots cut out after flowering.

With this object in view, the seeds should be sown thinly and the seed-bed made firm by treading. When the seedlings are of a suitable size, they should either be transplanted about three inches apart, firming the ground as before, or thinned in the seed-bed to allow plenty of room for the seedlings to develop. Plants raised in this manner have very decided advantages over those which are allowed to become drawn and attenuated by close contact with each other in the seedling stage. Select varieties which in former years have done well and these should include one of the autumn varieties to follow the latest batch of Autumn Giant Cauliflower, with a selection of the winter and early spring sorts, as well as those which are in use during April and May; the earliest batch of spring Cauliflowers will be ready in June, and so complete the cycle.

**Disbudding Peach and Nectarine Trees.**—The earliest trees having been attended to, the later ones should be disbudded and the fruits reduced in numbers. In doing this work, which in reality is a form of summer-pruning,

FIG. 136.—*HABERLEA RHODOPENSIS*, STORMONTH'S VAR.  
(see p. 283).

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Grafting Fruit Trees.**—Although the grafting of fruit trees is not much practised in private gardens, there are occasions when it might be done with advantage. Trees which have proved unsuitable for the particular district, if headed back in November, may now be further shortened and re-grafted with varieties which can be depended on to succeed. In districts where canker is prevalent on Apples, select varieties that are not very susceptible to the disease; excellent results have been obtained where badly cankered trees have been headed back and re-grafted with Bramley's Seedling. This strong-growing variety seems not only to escape attacks of canker, but also by the transference of its sap throughout the cankered stock, completely eradicates the last traces of the disease, and a series of experiments are now being made by inserting one or two grafts of this variety on various trees without heading them back, to see what effect it may have under these conditions.

**Broccoli.**—The main sowing of Broccoli seed should now be made in ground that is not too rich, as sturdy growth from start to finish is of primary importance with this crop.

a certain amount of knowledge of the different varieties is necessary, as well as a close observation as to the health and vigour of the trees, for while some kinds produce an enormous number of surplus side-shoots, which must be reduced to enable those left to mature properly, other varieties produce these side-shoots very sparingly, and consequently require very much less disbudding. The work should be spread over a period, and if the most awkwardly-placed shoots are removed first, selection of the remaining shoots may be made later, and finally, at a third operation, only those shoots left which are required to furnish the tree with fruiting wood for next year. When this system is followed, it will be found that little or no check has been given to the tree; and their growth will continue uninterrupted. A similar method is recommended for reducing the immature fruits, finally leaving only those which, by their positions on the trees, are likely to get their full share of sunshine, and not be interfered with by crossing wires or branches, as fruits thus damaged are of little value.

**Sowing Hardy Annuals.**—The spring sowing of hardy annuals should be made now, and where beds or borders are set aside for them, remarkable results may be obtained at a small outlay. Sow sparsely, and thin the seedlings when they are about three inches high.

## ORCHID NOTES AND GLEANINGS.

### CATTLEYAS AND THEIR ALLIES.

In addition to species this large group of Orchids contains many hybrids of diverse parentage, but nearly all succeed under practically the same conditions, so that for cultural purposes they may be placed together.

There is much diversity of size, form and colour, some being large plants and others small; some produce thick, fleshy roots, and others thin ones; and each has an individuality of its own which must be considered. Whilst the strong-rooting kinds may be placed in large receptacles, the weaker rooting sorts should be placed in small ones.

Plants which produced their flowers during the late autumn and winter months are best repotted so soon as new roots are observed to be pushing from the base of the last made pseudo-bulb. Fortunately, these delightful plants flower at different periods so they may be enjoyed practically the whole year round.

A clean, open material, made up of equal parts of *Osmunda fibre* and A.I. fibre, from which all the fine, earthy particles have been removed, with a small quantity of live *Sphagnum*-moss answers their requirements; and the plants should be potted firmly, as this compost will hold water much in the same way as a sponge if placed loosely in the receptacles. To cultivators of this large family I venture to offer a word of caution against the continual change of material used as a rooting medium. Drastic changes are not beneficial, and experiments should be made on a limited number of plants at a time. The chief points in the cultivation of Cattleyas and their allies are, firstly, an even temperature, with a sweet, buoyant atmosphere; secondly, a clean rooting medium; and, thirdly, water, when growing, whenever they become dry at the roots, with sufficient to keep them plump and healthy at all times. Clean, soft water should be used as hard water may do irreparable harm.

*Cattleya Trianae*, *C. Percivaliana* and others may be repotted soon after their flowering period is past, as many will commence to make new roots whilst in bloom. These may be followed by those which produce their flowers at a later date, so it is quite possible that some members of this large family, which includes Cattleyas, *Laelio-Cattleyas*, *Brasso-Cattleyas*, *Sophro-Cattleyas*, etc., will need potting at different periods. The small-growing kinds are best grown in pans suspended where they will receive all the light available. *J. T. Barker.*

## INDOOR PLANTS.

### LUCULIA GRATISSIMA.

*LUCULIA gratissima* is included amongst those greenhouse plants which are regarded by the ordinary gardener as difficult to propagate; nevertheless, with proper treatment and management, cuttings will root readily, and, moreover, the propagator, if successful, will be amply repaid for his trouble.

*Luculia gratissima* is one of the gems of the greenhouse. Its fragrance is superb, while its rose-coloured flowers show to great effect against the green, oval foliage. Both this species and *L. Pinceana*, which has white flowers, are useful pot plants.

In some text books the following advice is given:—"Take young shoots from half-ripened wood in June and dibble them in the ground under a bell-glass." Some growers may find this a suitable method of propagation, but I am inclined to think that if growers adopt the following plan they will secure a larger percentage of rooted cuttings than if they are inserted in June. During the spring, old plants growing in a nursery bed in the open should be potted and brought into a house having an intermediate temperature and started into growth.

With careful watering and management, the young shoots soon begin to appear. These, when four or five inches long, should be taken off near a joint or with a heel. Only cuttings of medium thickness should be selected, as these

do not damp off so readily as thicker ones. Place the cuttings in small pots filled with sharp sand. Plunge the pots in a propagating case where a gentle bottom-heat is available, and keep the case closed until the cuttings have rooted, then admit a little air each day, gradually increasing the amount until the cuttings are ready for shifting into three-inch pots, in a compost formed of sweet loam and peat in equal parts, with a handful or so of sharp sand added. Do not pot too firmly, and after potting remove the plants to the staging in the house in which they were propagated.

From that stage onward, the plants will need no extra care, beyond the ordinary cultural treatment given to plants of this category. On no account should the growth be hindered for want of root-room, therefore, shift the plants into larger pots when necessary. During the winter the plants should be pruned severely, according to the shape required. In this way fine, bushy growth will be obtained. Plants treated in this manner grow to a large size and are useful for either pot cultivation or planting out in a border. *G. B., Matlock.*

## FLORISTS' FLOWERS.

### SINGLE CHRYSANTHEMUMS.

No type of *Chrysanthemum* is enjoying greater popularity at the present time than the Single. Great improvements have been made with this type of the flower during recent years, both in the colour and size of the flowers. Some raisers have raised varieties with somewhat heavy flowers having several rows of florets, which lessens their value for light decorative work. For fairly large vases, however, this type of flower is quite suitable, and the lasting qualities of the blooms are good, especially if they are cut when fresh and with only a moderate length of stem.

Robert Collins, Mrs. W. J. Godfrey, Mrs. Hancock, Phyllis Cooper and Molly Godfrey and its sports are all strong growers, which often reach a height of over seven feet, and a greenhouse with a fair amount of headroom is required for their accommodation. There are other varieties of dwarf habit which lose nothing in point of size and quality of flower; *Hilda Shoebridge*, *Pink Beauty*, Mrs. A. Robertson, and the popular old crimson variety, *Sandown Radiance*, are excellent examples. The last variety is still the most pleasing shade of its particular colour. The variety *Miss Joyce Moore*, though very large and much easier to cultivate, is, in many points, inferior to it.

Most of the modern Singles seem to have a tendency to flower later than the older type, and are not at their best until November is well advanced. I grow all the Single sorts without any stopping or pinching, but disbud the larger-flowering ones severely. For the decoration of dwelling-rooms, a vase arranged lightly with a moderate amount of first-class blooms is far superior to one which is crammed with sprays of inferior quality.

I find that stopping the plants results in blooms which incurve slightly at the tips, thus losing much of their natural and graceful appearance. This applies particularly to Robert Collins and Molly Godfrey and its sports. The same result was not noticed in the case of Mrs. W. J. Godfrey and Mrs. Hancock, which have narrower and less numerous florets.

These strong-growing Singles should be propagated before the end of December and subsequently given the same generous treatment as the Japanese varieties which are being grown to produce large exhibition blooms, the aim in the case of Singles being to limit the plants to about a dozen blooms each.

The staking of the taller varieties should be done carefully, more than one stake being required for their support. A strand of wire strained between two stout posts will also be necessary to secure the entire line against boisterous winds, as an open position is desirable during the time the plants are growing outside, and strong westerly winds are often troublesome if a hedge or similar screen is not available to break the full force of the gale.

The following is a useful selection of standard varieties, embracing a wide range of colour: Robert Collins, Susan, Molly Godfrey, Bronze Molly, Fantasy, Catriona, Pink Beauty, Phyllis Cooper, Mrs. W. J. Godfrey, Mrs. Hancock, Miss Joyce Moore, Sandown Radiance, Mrs. A. Robertson, Hilda Shoebridge, Portia, Margaret Davies and Mrs. Palmer. Lady Mary Davey is smaller, but the colour is a very vivid shade of terra-cotta, and this variety produces plenty of flowers which are especially suited to dinner table decoration if they are partially disbudded. Sweet Auburn, too, is useful if grown in the same way. *Charles Hodgson, Acton Place Gardens, Acton, Suibury, Suffolk.*

## HARDY FLOWER BORDER.

### VERATRUM.

*VERATRUM* comprises a genus of hardy herbaceous perennials that deserve more attention and are worthy of inclusion in herbaceous borders, etc., on account of their handsome, broad-ribbed, ovate foliage. They are also suitable for grouping in the centre of beds or for fringing a shrubbery border, their handsome foliage producing a sub-tropical effect.

The plants grow from four feet to six feet tall. The shoots terminating in dense branching spikes of flowers, forming a large, pyramidal panicle from July to September.

*V. album*, the False White Hellebore, produces prettily ribbed foliage and greenish-white flowers; *V. nigrum* has blackish-purple flowers, whilst *V. viride* is similar to *V. album*, except that the flowers are green. The propagation of these plants should be done in autumn or early spring. *W. L.*

### STAKING HERBACEOUS PLANTS.

THE staking of herbaceous plants is too often badly done, the shoots being tied up in bundles, or else neglected until they have tumbled down. Many plants, such as Michaelmas Daisies and Heleniums, are easily staked if the shoots are thinned to four or five, and each secured singly to a neat stake; the resulting display will be much better than otherwise, as each growth will have room to branch and develop to its full extent.

Many plants are difficult to stake in the orthodox way; this applies to many slender-growing plants which should be supported with branches, placed in position early, thus allowing the plants to grow through and over them. With very little attention, these plants will arrange themselves in a pleasing and natural manner. If this method was more generally adopted, much time and trouble would be saved in the staking and tying up of herbaceous plants. *C.*

## ALPINE GARDEN.

### THE SATIN FLOWER.

THE *Sisyrinchium*s have been flowering exceedingly well since early March. The pretty, satiny, purplish-pink flowers of *S. grandiflorum* are extremely effective, while the snow-whiteness of *S. grandiflorum album* is very beautiful.

The foliage is narrow, grass-like, while the dainty, bell-shaped-nodding flowers are of a brilliant, transparency, and add charm to the plant when massed in the rock garden.

*Sisyrinchium*s should be planted in light, sandy, peaty, moist soil, in partially-shaded situations. *W. Logan.*

### DOUGLASIA LAEVIGATA.

THIS dainty species is not nearly so well-known as its congener, *D. vitaliana*; it is a dense- and low-growing plant which, in spring, is studded with small, rose-pink flowers. The latter are abundantly produced and borne on erect peduncles about one inch long; the leaves are linear or oblong-lanceolate in shape.

### WHAT USERS SAY:

"The 'Governor' Motor Lawn Mower gives me the greatest satisfaction. In two half days the gardener does by himself mowing which previously took him nearly two whole days with an additional man to help. I am strongly recommending it."

E. W. RAVEN-HILL,  
Park House, Brentwood.

"It is easy to start, easily manipulated in confined spaces and has made a good job of the heaviest growth without any trouble whatever." (Extracted).

"We have nothing but praise for the water-cooled 'Governor.' It gives no mechanical trouble and works economically and quickly. Absence of complicated parts is a strong point in its favour."

J. H. MATTHEWS,  
Aldridge Cricket Club,  
Walsall.

"The 'Governor' is quite the best mechanical job of its sort that I have yet seen."

FREDK. A. FITCH,  
M.I.M.T.,  
Tunbridge Wells.

"I do not wish for a more efficient machine, and the very moderate price is an additional attraction."

M. W. MYERS, D.D.  
Frodsham, Cheshire.

12-months' Guarantee with each machine. 5% Discount for Cash. Easy Payment Terms if desired. Free delivery to any station in Great Britain or at port in Ireland.

CLIBRANS LTD.  
The King's Nurserymen  
ALTRINCHAM.

It is a choice plant for a sunny ledge and grows well in gritty, well-drained soil. It is also happily placed and very pretty when grown in a pan in the alpine house. An American species, it is a native of the Oregon Mountains.

#### PORTULACA GRANDIFLORA.

SUNNY ledges of the rock garden will prove ideal positions for this brilliant little annual; arid conditions are essential to its welfare, and a gritty, rather poor soil will meet its requirements.

Plants may be raised in warmth and transplanted, but I find it better to sow the seeds in their permanent stations; from early to mid-May being a suitable time for sowing.

I once saw these plants draping the edge of a low terrace wall and growing in granite with gravel and stone beneath; it was a very hot season and the plants grew and flowered exceedingly well. The flowers are variously and brilliantly coloured, three or four together, terminal, surrounded by whorls of crowded leaves; the latter are scattered, cylindrical, somewhat succulent and acute.

This brilliant little plant does not exceed a few inches in height; it was introduced from Brazil in 1827. There are double-flowered varieties. *Ralph E. Arnold.*

#### RANUNCULUS NYSSANUS.

Of the series of *Ranunculus* in commerce, *R. nyssanus* is not at all common, although it is a cheap plant to purchase. It first came under my notice a few years before the war, when I procured a specimen and retained it until my removal to my present garden. Although I am not prepared to endorse the high opinion held of this Crowfoot by the late Mr. Reginald Farrer, *R. nyssanus* is an interesting and useful little plant.

It is excellent for covering a considerable amount of space rapidly by means of its runners, but, as these develop above ground, it may be easily kept in bounds. When out of flower it presents a mass of hairy foliage, and above the leaves, in summer, rise stems from six to twelve inches high, according to the conditions under which the plant is grown, bearing bright yellow flowers. The latter are of good size, and it is a little unfortunate that the period of blooming is not extended. This Crowfoot is easy of culture, and may be grown on rockwork or on the level ground, and in either place will flower well. It may also be grown in either heavy or light soils, and an additional advantage is that it will flourish in sun or shade. I am not aware if seeds can be obtained from the trade, but plants are available, and there is still time to plant them this season. *S. Arnott.*

#### VIOLA SPECIES.

It is a pleasure to see Col. E. Enever Todd's notes on *Viola* species, the result of endless research, that are appearing in *The Gardeners' Chronicle*. They will be most helpful to the many who are interested in this important race with its many beautiful species and endless varieties.

During a visit to the South of Spain in February last, in which most of my time was spent in wandering off the beaten track to see the various flowering plants that occur in that region early in the year, one of the most interesting plants that I had the pleasure of seeing was *Viola arborescens*. This was abundant in a very limited area near Malaga. Well-established plants were lovely little clumps smothered with white, lavender-flushed, good-sized flowers. Some of these Vicks were like little, round bushes, covered with flowers and with stocky, woody stems, well on to half-an-inch thick. These must have been very old specimens, as the younger ones were not so compact. The plants were on the shady slopes in dry, stony positions, being partially protected from the fierce sun of that region even at this early period of the year. Others were also frequently

in the shelter of larger plants. Many of the plants had seeds, of which I collected a few ripe or ripening. There were also numbers of seedlings springing up round some of the more sheltered plants.

In reference to the seeds, which I had on a table in my bed-room to dry, for some time I could not realise what the "clicking" noise was in the dead of night, until I discovered that it was the *Viola* seeds ripening and scattering the seeds abroad in the interesting way that *Viola* seeds have of doing, some of the less desirable species producing self-sown seedlings only too frequently in the garden.

*Viola elegantula* (*bosniaca*), with me, is only really good for one season's flowering; the plants do survive the winter frequently, but the flowers in the following season are not nearly so fine. Cutting back and preventing seeding do not succeed with this species in the same way as this treatment does with many of the *Violas*. All the large-flowered *Violas* seem to have a tendency to flower themselves to death; even the garden varieties, if allowed to seed.

slender stalks, each bearing a terminal cluster of flowers.

The number of flowers on a plant has increased under cultivation, and seedlings show variation in size and colour of the flowers. The colour is usually bright lilac or pale purple, with numerous rich yellow spots in the throat. *H. r. Ferdinandi-Coburgi*, *H. r. Austini* and *H. r. Stormonth's var.* (Fig. 136) are varieties of good colour, and mention may also be made of a free-flowering white one of great beauty, known as *var. virginalis* (Fig. 137).

Culture and propagation of these charming plants are not matters of great difficulty, but care and patience are required to grow them satisfactorily. They flourish in cool, shaded nooks, which afford them shelter from scorching sun and drenching rain.

They appreciate a deep root-run in soil which is well-drained, while at the same time it is capable of retaining a fair amount of moisture during spells of drought. A compost of two parts of loam, one part of leaf-mould and a little grit is recommended. Planting may be done in

FIG. 137.—HABERLEA RHODOPENSIS VAR. VIRGINALIS.

There is no doubt that many of the *Violas* growing in warm, fully-exposed positions in hot climates are biennial, producing seeds very freely and a continuity of plants therefrom.

A *Viola elegantula* hybrid that I received from a friend last year (a long, large-flowered plant) looks much stronger after the winter, but it has not flowered yet. *T. Ashton Lofthouse, Linthorpe, Middlesborough.*

#### HABERLEA RHODOPENSIS.

*HABERLEA rhodopensis* is one of very few species of the large family Gesneriaceae which may be grown with success in the open. It occurs wild in one district only, on the southern slopes of the Balkan mountains, whence it was introduced in 1880 by Leichtlin, and flowered the following year at Kew.

*Haberlea* resembles *Ramondia* in habit, forming flattish rosettes of dark green, hairy, toothed leaves, from among which rise numerous

autumn or spring. The crevices in which the plants are to make their home should be deep and roomy, and when the plants are in position the soil should be well worked in about their roots.

Stocks of *Haberleas* are best increased by raising seedlings. The seeds are minute and should be sown in early spring in well-drained pots of fine, sandy soil. Sow very thinly and only just cover the seeds with soil. Cover each pot with a sheet of glass and stand it in a close, shaded frame. After pricking them out, the young plants should be grown on in a frame, care being taken that they are not exposed to long periods of strong sunlight or allowed to become dry at the roots. Old plants which have become too crowded may with advantage be divided and replanted in fresh soil.

In conclusion, it must not be overlooked that *Haberleas* are extremely effective when grown as specimen pot plants. They are delightful when seen flowering in March and April in a cool and airy alpine house, together with some of the choicer *Saxifragas*, *Primulas* and other plants worthy of similar treatment. *N. K. G.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W C 2

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## CROWN GALL AND CANCER.

MOST horticulturists are familiar with the largeswellings which occur on the stems and roots of various plants and which are popularly known as "Crown Galls." Mr. Erwin Smith, the veteran American plant pathologist, who has studied the disease for many years, has repeatedly stated that the appearances displayed by the galls are of such a nature that we may reasonably speak of them as plant cancers. From the fact that for some time no organism could be definitely associated with these galls, an opinion arose that here was a type of growth quite unlike that known elsewhere in the plant kingdom; consequently, the analogy drawn between them and animal cancer has received a considerable amount of support. A great stumbling block, however, is the radically different cellular structure and manner of growth in animals and plants; the absence of a circulating system, of a central nervous and digestive system in plants are differences which, in the opinion of many, make it extremely unwise to lay too much stress on apparent similarities between the two diseases.

The Italian botanist, F. Cavara, in 1895, first succeeded in isolating an organism from Crown Gall, and twelve years later Erwin Smith, working in collaboration with Townsend, proved conclusively that this bacterium, to which they gave the name *Bacterium tumefaciens*, was the causal organism. A fact which seemed to support the idea of a close connection with malignant tumours is that it is impossible to demonstrate the presence of the bacterium within the tumour cells, although the disease can be brought about artificially by inoculating from cultures. In his later work, Erwin Smith has drawn more and more analogies between Crown Gall and human cancer. From a purely scientific point of view it would be extremely interesting, and in some ways most useful, if the two diseases could be proved to have anything in common. On the other hand, if the relation between the two were anything like so close as Blumenthal, a German bacteriologist, has suggested, the growing of plants would carry a risk which some would not care to face.

As everyone knows, we are still ignorant of the causal organism of cancer, or, indeed, whether or not the disease is purely physiological. Evidence on the whole points to parasitism, and probably cancer problems at the present time attract more workers than does any other biological or medical investigation. Blumenthal and his collaborators, working at Berlin, recently isolated from the margins of human tumours, a bacterium which gives cultural reactions almost identical with those of *Bacterium tumefaciens*, and at least one of the forms proved capable of reproducing Crown Gall in Sunflowers and tumours in healthy animals.

A disturbing coincidence then occurred. Robinson and Walkden, working at Manchester on Crown Gall on the garden Marguerite, found that *Bacterium tumefaciens* was present on the rough exterior of the galls, thus explaining why Erwin Smith failed to demonstrate the bacterium within the tissues.

The two diseases, plant and animal, suddenly and unexpectedly assumed an apparent identity. The interest of medical men was aroused, and as a consequence, Professor W. Robinson was invited to give a paper before the Section of Tropical Diseases and Parasitology of the Royal Society of Medicine on April 6, with the title "Some Features of Crown Gall in Plants in reference to comparison with Cancer." In this he showed conclusively that the far-reaching comparisons drawn by Erwin Smith between gall and cancer are extremely questionable. Most, probably all, the features regarded as showing special resemblance to cancerous growth follow as a normal consequence of the infection of growing plant parts, and resulting secondary galls are in no way similar to metastases. The only thing they have in common is a typical proliferation of the cells. A critical consideration of Blumenthal's suggestion of a possible connection between the causal agent in Crown Gall and malignant tumours proves that it is in no way conclusive. It would be out of place here to consider the various details, but Professor Robinson's lecture will go far towards preventing medical men from considering Crown Gall in plants as anything more than an instructive plant disease, and should allay all fears of those interested in their garden regarding the chance of becoming infected with a dire malady when engaged in the most healthy of occupations and pastimes. J. R.

## AESCULUS CALIFORNICA.

(See Supplementary Illustration).

The specimen depicted in the Supplementary Illustration presented with this issue represents a tree of the above name growing in the park at Stanage, at an altitude of some 800 feet above sea-level; it is from a photograph by Mr. Heyworth, Knighton.

The tree, which was grafted, I take it, upon the Horse Chestnut (*Aesculus hippocastanum*), was planted out, to the best of my belief, sometime in the early sixties of the last century. Our predecessors in those days were always tutored in the doctrine that the best way to perpetuate these little, smooth-fruited, prettily-flowered Horse Chestnut trees, was by budding or grafting, and that this was a rule that collectors should subscribe to and truly observe. My predecessors evidently conformed to the advice of the day. Whether they planted our tree on the most appropriate site is a question for the amiable discussion of an outspoken family circle, or the ever ready criticism of visitors. Not that I resent remarks in such directions; anything is better than a dull apathy amid the glories of countryside scenes. Besides, one need never act on unconvincing suggestions. Our tree, I am afraid, is located too near a giant Oak, which rather overtops and over-shadows it. These trees want a place rather among their equals than the mighty ones, isolated, or in a grove, not in a clump or cluster.

The tree depicted measures nearly fifty feet in height and four feet in girth. Elwes, and Henry's best tree, growing in the Isle of Wight, measured thirty feet in height, but that must have been eighteen years or so ago. We reckoned ours at that time as something between thirty-five feet and forty feet. I make no claims to championship for our example, nor boast of its departure from the canons of proportion as laid down in the estimate of authorities, which, so far, seems to rate the height in its native country at forty feet, and perhaps a little less in ours. On the contrary, I render apology for its apparently wilful nonconformity to established rules, and the discipline of procedure, but at the same time plead that there is no hard and fast obligation to submit to any uniform height standard in tree life, such as was once required of polo ponies at Hurlingham; variations in these directions will occur in the best regulated families.

There was, in ancient history, but one paramount Queen and Goddess of Beauty, called Aphrodite or Venus; one statue of her at Florence, called the Venus de Medici, represents

her as five feet four inches in height, while to instance other portrayals of her, in the Venus of Cnidus or the Venus of Miletus, she is evidently evolved from a far taller and more stately model. Yet they are all one and the same personality, though represented by differently-sized statues. So let our tree be forgiven if it has exceeded the statutory limit.

*Aesculus californica* belongs to a genus that once was, and sometimes is now, called *Pavia*. These *Pavias* were of the same order as our well-known Horse Chestnuts, at one time called *Aesculaceae* and now *Sapindaceae*. They boast many aliases. *Pavia* was a name given to them in honour of one Peter Paw, a name that if you are not careful in the writing of might easily be described as Peter Pan. Another name bestowed is that of Buckeye, for the rather complicated reason that the so-called hilum, or scar of the seed, when abstracted from the husk, is apt to glare at you rather fixedly—so some imaginative minds have suggested—like a ship's dead eye. In some circles, anyone narrating experiences of this sort would render themselves open to obvious suspicion! The last of the names I can find attributed to this section is a very self-explaining one, and that is the smooth-fruited Horse Chestnut tree.

While the full-grown Horse Chestnuts are well-known by the spiny husks of their fruits, called in scientific circles, *echinata*, a word that finds ready admission to rural intelligence, when we translate it, as "with bristles like a hedgehog," the smaller *Pavias* present an outer circle of husk unarmed with anything in the nature of prickly and spiny appendages.

To revert and comment upon a few habits and varieties of the lesser *Aesculus* or *Pavias*. We read in older works that there were three aboriginal species of this once-called *Pavia* genus, of which the red-flowering (*P. rubra*), and the yellow-flowering (*P. flava*), must most certainly stand out as independent candidates for individual claims to original honours. If colour of flower constituted claim to primitive fame, we must look down the list of aspirants for the third place among those species that are clad in purple colours. There was once a shrub or small tree, ten feet high at most, called *Pavia discolor*, that was credited with bearing purple flowers. But *P. discolor*, as a name, among the more modern authorities, seems to have been relegated to the ranks of the forgotten, or submerged under a newer nomenclature. Then there is another with the more up-to-date name of *A. purpurascens*, a cross between *A. octandra* and *A. Pavia* (once called *P. rubra*), mentioned by Bean. This tree also "sports the purple." The old family name of *Pavia* seems to be dying a natural death and dropping into abeyance. I take it, this arises from the fact that the *Aesculus* family so freely cross-fertilise that the old line drawn between the bristle-coated Horse Chestnuts and the smooth-fruited Buckeyes, is gradually wearing away. The half and half colour of the flowers seems to prove this, and so the usual confusion, as in composite-bred animals and mixed races, is bound to arise and puzzle pursuers in the cult of exact definitions.

Our tree, which, by the way, has been identified by Kew and other authorities, shows the typical long, tapering, acuminate leaflets in its palmate arrangement, and that constitutes one of the hall marks of its identity. Perhaps in some cases the terminal leaflet of our tree exceeds in length the measurements assigned to it by some. In other respects it seems to conform fairly well in colour of flower, white with pink tinge, for instance, with what is expected of it.

To write of these little Horse Chestnuts as scenic ornaments, and where to suggest planting them, would perhaps be a presumptuous undertaking at any time, but to attempt to do so without the actual scene before one would be like tuning of the fiddles before the opera. A middle-sized house, or a long, low house, a bungalow-built house, always seem to me to cry out for middle-sized or smaller-sized, thirty or forty-foot trees.

Tall, enormous trees are apt to overshadow and overpower by their disproportionate size, and height; there should be refinement in their outline. If, for instance, *Pavias* were growing in the grounds of houses on the outskirts of

many of our towns, where now Wellingtonias, Deodars and Monkey Puzzles—monstrosities only because they are misplaced—are now growing, burying, darkening and obscuring the window lights there would be picturesqueness instead of ugliness. *Chas. Coltman-Rogers, Stanage Park, Radnorshire.*

## PRUNUS YEDOENSIS.

This is the Cherry so extensively planted in the parks, streets, cemeteries and temple grounds of Tokyo, Yokohama, and other places in Japan. In his remarkably interesting *Monograph of the Cherries of Japan*, published in March, 1916, Mr. E. H. Wilson states that over fifty thousand trees of *Prunus yedoensis* are growing in the city of Tokyo and the immediate neighbourhood.

It seems remarkable that such a very popular Japanese Cherry should have only quite recently

form which received the Award of Merit (see p. 256) when exhibited by Mr. R. C. Notcutt at the fortnightly show of the Royal Horticultural Society on April 5. A tree at Kew raised from seeds received from the Arnold Arboretum in 1915 has flowers half the size, and with the pubescence of *P. sibirica*.

In habit, *P. yedoensis* is described as a fast-growing tree up to fifty feet in height, with a spread of branches fifty feet to sixty feet through. It flowers in March, with *P. sibirica*, but at least a fortnight or more in advance of the many beautiful named varieties of Japanese Cherries—forms of *P. Lannesiana* and *P. serrulata*. The blooms are borne in clusters of two to six, pale blush when opening, changing to white with age. They are slightly fragrant. The fruits are shining, black and globose in shape.

Because of its early flowering and floriferous characters, *P. yedoensis* should prove a useful addition to the trees grown in pots for greenhouse, decoration in early spring.

## GUARANTEES AND WARRANTIES.

ON every sale of goods certain things are "guaranteed" or "warranted" by law, that is whether there is any express agreement in the contract having that effect or not, in addition to this, of course, the parties frequently make similar arrangements themselves; what are the effects of these arrangements?

What is generally known as a "guarantee," is at law either a *condition* or a *warranty*. If it is an agreement which is collateral to the main purpose of the contract it will be a *warranty*, but if, on the other hand, it is of vital importance to the contract, it will be a *condition*. For example, where A was buying some Hops and told the seller that if sulphur had been used in their production he "would not even ask the price," and it afterwards turned out that sulphur had been used, although only for a very small proportion of the Hops, it was held that this was a *condition* and not a *warranty*. The Court

FIG. 138.—PRUNUS YEDOENSIS.

been introduced to American and European gardens. The first record of the tree in America is the raising of plants from seeds received from the Tokyo Botanic Garden in 1902. Kew first received seeds from the Arnold Arboretum in 1915.

*Prunus yedoensis* was named and described by Matsumura in 1901. With the limited knowledge of the history of the tree available at that time, he gave Oshima Island in the Province of Idzu as its country of origin. The indigenous Cherry of that island, however, according to Mr. Wilson, is the wild form of *Prunus Lannesiana*, in cultivation at Kew and elsewhere as *var. albida* and *var. spontanea*.

The generally accepted origin of the subject of this note at the present time is that it is a hybrid between *P. sibirica* *var. ascendens* and *P. Lannesiana* *var. albida*. This is rather borne out by the considerable variation in the botanical characters of trees of *P. yedoensis* raised from seeds. The spray illustrated (Fig. 138) is from the tree which supplied the material for the *Botanical Magazine* (tab. 9062), and has flowers an inch across, most resembling *P. Lannesiana* *var. albida*. This also was the

With regard to propagation, the best forms only should be propagated by budding, in preference to raising a mixed collection of forms from seeds.

The name *Prunus serrulata* *var. Yoshira* was given in conjunction with *P. yedoensis* on the card recording the Award of Merit referred to. This name does not appear in Wilson's Monograph, and it is to be hoped that only the name of *P. yedoensis* will be used in nursery catalogues.

Considerable confusion appears to exist in the spelling of the Japanese name of this Cherry. A tree obtained from Hesse for Kew in 1898, under the name of *Cerasus Pseudocerasus Yoshima* has since been identified as *Prunus yedoensis*. The name of *P. serrulata* *Yoshira* was bracketed with *P. yedoensis* at the fortnightly show of the R.H.S., when the Award of Merit was given. In the *Journal of the Royal Horticultural Society*, Vol. 50, Part 1 (1925), p. 96, Mr. Collingwood Ingram, in his "Notes on Japanese Cherries," gives the spelling of the Japanese name as *Yoshino*! *A. Osborn, Kew.*

considered that to a certain extent the making of the contract depended on the presence or absence of the sulphur.

Why is it so important to distinguish between a *warranty* and a *condition*? The importance of the distinction lies in the fact that the remedies for breach of *condition* are far superior to those for breach of *warranty*. In the case of a breach of *warranty* the injured party is only entitled to ask the Court to award him damages, he cannot claim to have the whole contract set aside; whereas in the case of a breach of *condition* the general remedy is the setting aside of the entire agreement, or the injured party may, if he likes, treat the *condition* as a *warranty* and claim damages or a diminution of the price.

Among those conditions implied by law is one that where a buyer makes known to the seller the purpose for which the goods are required so as to show that he relies on the latter's judgment, and it is the seller's business to supply such goods, there is an implied condition that the goods are reasonably fit for the purpose specified. Thus, if some weed-killer is purchased under the above conditions, and

the buyer intimates that it is to be used on a lawn, should it prove injurious to the grass and only intended for paths, the seller could be proceeded against under this implied condition. It must, however, be mentioned that this rule does not always hold good in the case of articles sold under a patent name.

Secondly, where goods are bought by description from a person who deals in goods of that description, there is an implied condition that the goods are of a merchantable quality; provided that if the buyer has examined them there is no implied condition as regards any defects which the examination ought to have revealed.

Lastly, where goods are sold by description, there is an implied condition that they shall correspond with that description, and if the sale is by sample as well as by description, the bulk of the goods must correspond with both the sample and the description. *Harold Sharman.*

## NOTICE OF BOOKS.

### Chrysanthemums.

THIS interesting brochure\* consists of two quite distinct parts—a long and interesting historical and physiological note by way of introduction, by the late Henry L. de Vilmorin, which first appeared as an article in the *Revue Générale Internationale* for March, 1896; and directions for the cultivation of the Chrysanthemum, which have been thoroughly revised and brought up to date for this, the third edition of the book. For the value of the cultural directions it is sufficient to state that the book emanates from the famous firm at Verrières; those who have seen the Chrysanthemums shown by the firm at the Paris autumn exhibitions will be satisfied that the methods employed to bring about such striking results must be of the best. The manner of presenting the information offered is also excellent, especially the illustrations, which are clear and informative, and add very greatly to the value of the brochure. Some of the specimen plants illustrated, described as "Forme Japonaise," are marvels of training, with their even rows of flowers all at the same stage of development; and whether one admires such ordered beauty, or prefers something a little less rigid, there is no doubt of the skill and experience required to bring about these results. The different forms are well shown in a series of line-drawings which will always be handy for ready reference. Pests and diseases are adequately treated and some useful lists are given of varieties suitable to the various methods of cultivation.

## PUBLIC PARKS AND GARDENS.

THE Corporation of Southport, Lancashire, is constructing a new open-air bathing lake in the Princes Park, the work having been begun partly in order to provide relief work for the unemployed of the Borough. It is intended to give the lake a picturesque setting, the effect being that of a lake in a garden; raised seats are to be provided on terraces round the water from which the whole of the park will be visible. The main entrance to the lake will be from the park, with subsidiary entrances from the Marine Drive. The dressing box pavilions, café and long varandahs are placed with their backs to the prevailing winds, and form a semi-circle which will protect the bathers as well as the visitors sitting on the terraces. The lake is elliptical in shape, the maximum length being 330 feet, and the maximum width 212 feet; it will contain 1,400,000 gallons of water. The depth will vary considerably in different parts of the lake, the maximum diving depth being nine feet.

## LEAF SCORCH OF AZALEA.

### A NEW FUNGUS DISEASE.

IN 1926, in the May number of the German gardening periodical, *Der Blumen-und Pflanzenbau*, there appeared an article by Dr. Flachs entitled "Septoria azaleae, a Dangerous Disease of Azaleas."\* The writer stated that in January, 1926, a remarkable disease of Azaleas occurred in one of the larger commercial nurseries in Munich. The affected leaves showed brown patches of irregular shape, which, starting sometimes at the margin, sometimes at the tip, soon extended further over the leaf. Later, these leaves dried up and fell off. Two early varieties suffered especially, viz., Madame Petrick and Madame Aug. Van Damme. The damage caused was very considerable; out of 2,000 plants, 600 were so severely attacked that they were unsaleable. Both the varieties had been imported from Belgium in the previous autumn and were forced during the winter.

as well as the general appearance of the disease, agreed completely with the fungus *Septoria azaleae*, described by Voglino in 1899.

Dr. Flachs states that the fungus is not new to Germany, since Ewert found it in 1908 in Lower Silesia on Azaleas which had been obtained from Saxony.

Some plants were also attacked by the mould, *Botrytis cinerea*, the flowers especially being affected. This fungus, though, was only an associate of the above-mentioned *Septoria*, and it rarely attacked the plants to any considerable degree.

The present disease, however, was first described, in Italian, by Dr. P. Voglino\* in 1899. Some of the more interesting points mentioned in this article, which is entitled "A New Disease of Azalea indica," may be given here. The author carried out his observations on affected plants in the Municipal Gardens at Turin. During March and April plants of Azalea indica exhibited, instead of the normal, vigorous, spring growth of healthy leaves, a diseased appearance due to the

FIG. 139.—LEAF SCORCH OF AZALEA.

An infected plant, showing almost complete defoliation.

Signs of the disease had been noticed in the previous year on the variety Simon Mardner, but no importance had been attached to it as the injury caused had been very slight.

Further enquiries made in Munich showed that the same disease had also appeared in two other nurseries which also had received supplies from the same firm in Belgium. Close inspection of the plants in question showed a disease of the leaves only; the stem and roots were apparently healthy. Sections made through the diseased portions of the leaf showed under the microscope, chiefly in the palisade or assimilation tissue, more rarely in the spongy parenchyma, fructifications (pycnidia) with colourless mycelium, which after being kept for some time developed thread-like spores which finally were ejected through the epidermis. The spores, which were more or less curved, averaged 15–20 $\mu$  long and about 2.5 $\mu$  broad. Their contents were finely granular and hyaline. With high magnification they were seen to be 1- to 2-septate. The shape and size of the spores,

leaves being brown and dried up. Further, through the diseased leaves falling off, the plants became by degrees more or less defoliated. It was noticed that plants on which the disease had persisted for several years were smaller in comparison with normal ones, their lateral branches were long and thin, their leaves shorter and narrower, and the number of their buds was reduced to a third. The difference between diseased and healthy plants was then so remarkable as to attract the attention of the general observer. The first sign of this leaf disease was a change to a yellow-reddish colour of a small apical portion of the leaf; this then turned to a rusty brown colour until, step by step, the whole leaf was turned brown, dried up and fell to the ground. Microscopical examination of the affected leaves showed the presence in abundance of mycelial hyphae in the palisade tissue, and especially in the spongy parenchyma. The pycnidia which occur usually on the lower, but sometimes on the upper surface, of the leaf are dark brown, almost round, and slightly depressed; they are at first immersed in the tissue of the leaf, but at length become prominent

Barrow-on-Humber Lincs.

(Sole proprietors of B. Eddy & Sons)

## WILLIS BROS.' Garden Fertiliser

### THE BEST ON THE MARKET.

### NO STABLE MANURE REQUIRED.

For digging in or as a top-dressing. For kitchen

Gardens or Herbaceous Borders.

1 cwt., 15/-; ½-cwt., 9/-; 28 lb. 5/-; £14 10/- per

ton. All Carriage Paid.

### LOOK TO YOUR VINES!

The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22%

Phosphate, and 4% Nitrogen, and the results justify us

in saying it is the best on the market. The effect on

old vines is very marked, it puts new life into them.

1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

### LAWN MANURE.

Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are

in the position to offer the above with perfect

confidence as to results. It is especially suitable for

poor mossy lawns, improving the texture of the grass,

and helping the lawns to keep their colour in dry seasons

Can be used at the rate of 5 cwt. to the acre.

1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage

Paid. Special Prices quoted for Grass Manures for

Park Land in quantities.

### LAWN SAND AND DAISY KILLER.

This preparation will be found very effective for

thickening the sward and encouraging the grasses; also

destroys the daisies and other weeds so troublesome

on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.

DIRECTIONS FOR USE.—Sprinkle thinly over the surface

of the lawns at the rate of 4 to 6 ozs. to the square yard;

where a mass of weeds occurs a little more may be used,

as the grass cannot get through until the weeds are

killed. A dry day in autumn or spring is the best time

to apply the LAWN SAND.

### SUSSEX TRUG BASKETS.

18" 4/-; 20" 5/-; 22" 6/-; 26" 7/-; 28" 8/-; each.

Carriage Paid.

### GARDEN SUPPLIES AT LOWEST PRICES.

# FERNS AND FERN CULTURE.

By J. Birkenhead

Revised by F. Parsons.

Price 1/4 post free.

**F**ERNS ought to play a much larger rôle than they do in the English garden. There are so many places where, in consequence of shade cast by tall trees or high walls, flowers needing sunshine will not thrive, and where Ferns, on the contrary, would luxuriate, given only sufficient moisture.

FERNS have a grace and dignity all their own, and can redeem by their beauty what would otherwise be a bare and unattractive corner of the garden. Those wishing to cultivate them cannot do better than purchase the little book whose title appears above. It can be obtained from:—

**GARDENERS' CHRONICLE, Ltd., 5, Tavistock Street, Covent Garden, W.C. 2.**

## RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

**T**his fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

*Send for a copy to-day, to:*

**THE GARDENERS' CHRONICLE, LTD., 5, Tavistock Street, London, W.C. 2.**

in the form of minute black points visible on the surface. When mature, the pycnidium bursts open and the spores emerge through an apical pore. These are elongated, narrowly cylindrical and oval-elongate, hyaline, minutely granular, 1-3 septate, sometimes constricted at the septa,  $12-18\mu \times 1.5-2.5\mu$ . The fungus was found to be new to science and named *Septoria azaleae*. A Latin diagnosis is given. The germination and growth of the spores on certain media are described; they gave rise to secondary conidia,  $8-10\mu \times 2.5\mu$ . Successful inoculations of healthy plants were made by placing spores in a drop of moisture on the leaf. It was observed that the mycelial hyphae, produced as the result of infection by pycnosporous, crowd round the vascular bundles in such a way as to impede the passage of liquids in the vessels, thereby causing the withering of the tips of the leaves. The production of secondary conidia (as had been noted in cultures) was observed on the surface of the leaf. The disease is perpetuated from year to year by spores contained in the pycnidia on fallen leaves. Diseased leaves, bearing pycnidia, were collected in March, and when examined in the following December, the pycnidia were found to contain viable spores. Further spread of the

amount of damage to different varieties and to see the effects of the disease on a larger scale than was possible with specimens sent to the laboratory. The following varieties were being grown in pots on the staging of the glasshouses: Prés. Osw. de Kerchove, Ern. Eeckhaute, Mad. Petrick, Vervaeneana, Tempérance, Mad. John Haerens, John Llewellyn and Ernst Thiers. All were badly affected with the disease, the first three named being in the worst condition and almost completely defoliated (Fig. 139). A quantity of the brown fallen leaves was scattered around the pots. Varieties less affected were stripped of their leaves except at the tips of the branches, where a terminal "rosette" of leaves remained immediately below the blossom buds (Fig. 140). These leaves also were turned brown, and it was difficult to find even two or three leaves of the original foliage unaffected on any plant of any variety.

The extent to which the original foliage had been retained appeared to influence the development of the flower buds and new wood buds. Thus in the case of the variety John Llewellyn, which was still provided with a few leaves (also infected) under the blossoms, the latter were opening regularly over the whole plant.

On the other hand, the variety Madame Petrick which was practically devoid of old foliage, showed no blossom buds opening, and there was little prospect of their ever doing so. The development of new leaves and the growth of wood buds, however, was more advanced in those varieties which had been most completely defoliated, and on those stems which had lost all their leaves a few lateral buds (situated above the leaf scars) were already swelling. In most cases, only the terminal wood bud (situated beside the blossom bud) had grown out and unfolded new leaves. The recently expanded foliage was not found attacked.

The disease is confined to the leaves, no other part of the plant being affected. The first symptom of attack is a brown coloration nearly always at the apex of the leaf; this extends across the whole width of the leaf-blade and gradually spreads downwards until the whole lamina is turned brown. The leaf usually falls off when the brown coloration has covered about half its area, but on rare occasions a completely brown leaf may be found still attached to the stem. While the leaf remains on the plant the boundary between the brown and green parts is clearly defined. With the naked eye, or better with a lens, minute black dots can be distinguished in the brown area both on the upper and lower surfaces of the leaf (Fig. 141). These may be scattered, but are most commonly grouped in patches, and here the surrounding leaf-tissue is somewhat darker brown. When in groups, the black dots cover nearly circular areas of from 1 to 4 mm. in diam-

The black dots are the fruiting bodies (pycnidia) of the fungus which is invading the interior of the leaf. They are imbedded in the leaf tissue (Fig. 142) below the cuticle and outer epidermal wall, and measure approximately  $1/10\text{mm.}$  ( $100\mu-145\mu$ ) in diameter. As they grow, the pycnidia force up the epidermis of the leaf into small mounds or blisters which eventually burst and so allow the liberation of spores from the pycnidium. These escape either in a long, tendril-like mass about  $30\mu$  thick or, if the rupture of the pycnidium has been more complete, they remain in an irregular heap about  $100\mu$  in diameter on top of the pycnidium. The spores are colourless, 1-4

FIG. 142.—LEAF SCORCH OF AZALEA.

Part of a transverse section of a diseased leaf. Two of the three pycnidia embedded in the palisade tissue have burst the upper epidermis and are discharging spores.  $\times 40$ .

septate, often slightly constricted at the septa, and are oblong-linear with rounded ends. The septation can best be seen under a high power objective with the spores mounted in Gram's Iodine Solution. The spores (Fig. 143) measure  $11-34\mu \times 1.5-2.5\mu$  (average  $19\mu \times 2\mu$ ).

In addition to forming pycnidia below the epidermis of both upper and lower surfaces, the fungus hyphae are found spreading through the leaf tissues and here and there accumulating so densely that they have the appearance of forming sclerotia. In the sections examined, such accumulations were found in the mesophyll and were close to vascular bundles; they are clearly distinguished when the sections are cleared in lacto-phenol and stained with Cotton blue.

Germination of the spores takes place readily in water. Small secondary conidia, measuring  $7-11\mu \times 2-3\mu$  were observed in the water, but no search was made for their production on the leaf surface.

While, in this country, the disease remains confined to imported stocks of indoor plants, it seems hardly necessary here to consider measures of protection by spraying, since in all probability it is brought from abroad already on the plants. Affected plants should be destroyed; Messrs. Duruz inform us that this was done with regard to the imported plants described above. In glasshouses where diseased plants have been standing, it is important that all fallen leaves should be removed

FIG. 143.—LEAF SCORCH OF AZALEA.

Spores of the fungus *Septoria azaleae*.  $\times 566$ .

FIG. 141.—LEAF SCORCH OF AZALEA.

eter, and are visible on affected leaves still attached to the plant, but are best seen on those which have fallen to the ground and after thus having been in a damp situation for some time, have been allowed to become partially dry.

and burnt so soon as the diseased stocks have been disposed of, in order that fresh, healthy plants coming into the houses in the following autumn shall not be exposed to infection. If the first signs of disease are observed early enough, the affected plants should be removed from the rest. By keeping the foliage of the remainder as dry as possible and by allowing the maximum ventilation consistent with safety, germination of any spores which might possibly have reached the leaves, will probably be prevented or retarded.

Damage to the leaves of imported Azaleas, caused by insect pests, has been noticed in this country; the symptoms should be distinguished

FIG. 140.—LEAF SCORCH OF AZALEA.

A stem of the variety John Llewellyn. In this variety a few leaves, which were brown at the tips, were left below the blossom buds. The extent of the brown, diseased areas is indicated by the dotted lines. March, 1927. (Natural size).

disease takes place by the conidia which are formed in abundance on the surface of the leaf. To control the disease, the fallen leaves should be collected and burnt.

A note, calling attention to the occurrence of the above disease in Germany in 1926, as described by Dr. Flachs (see above), appeared in *The Gardeners' Chronicle* of February 12, 1927 (page 109), and a warning was given that as the disease might appear in this country, it was advisable for growers to keep a sharp look out for it.

A few days after this warning was published, we received through the medium of *The Gardeners' Chronicle*, from the nurseries of Messrs. C. Duruz and Sons at Hythe, specimens of twigs cut from three different varieties of Azalea, which showed on the leaves undoubted symptoms of the disease.

We were informed that the plants affected formed part of a consignment from Belgium which arrived during the early part of September, 1926. Azaleas, when first potted up, are known to suffer a slight leaf-fall for a short period, but in the present instance the 200-300 plants (which at the time were not thought to be diseased) continued to shed their leaves throughout the winter until their defoliated condition rendered them unsaleable in the spring.

On March 22, 1927, a visit was paid to the nursery in order to form some estimate of the

from those above described and due to *Septoria azaleae*.

We should like to express here our thanks to Mr. W. Rigden, foreman at Messrs. Duruz's nurseries, who has helped us in the investigation of the disease by supplying us with numerous specimens and full information regarding them. *E. S. Salmon and W. M. Ware, South-Eastern Agricultural College, Wye, Kent.*

## MARKET FRUIT GARDEN.

It was the wettest March experienced at my place since 1914, the total rainfall being 4.29 inches, more than two inches above the average. The land was so wet that scarcely any cultivation or hoeing could be done. Apart from this, I do not think the heavy rainfall did any harm, so far as fruit trees are concerned. Fortunately, it is a normal, or perhaps slightly late season, Black Diamond Plum and a very few Gooseberries being the only crops in bloom during March. One may even take comfort from the heavy March rainfall in the thought that we are all the more likely to have fine weather when most of the bloom is open. That there will be a big display of Apple blossom is now certain; and Plums look more promising than might have been expected after last season's crop. So far, the buds are quite free from insect pests, as was anticipated after winter spraying with tar-distillate wash. The delay in starting spring cultivation can hardly be said to matter. So long as the soil remains moist, there is no urgent need to disturb the surface, unless weeds are troublesome; and so far they have made no progress. The extra time afforded for completing winter work, especially pruning, has been very welcome. A change to drier, sunnier conditions now, however, would be very beneficial.

### PREVENTING APPLE SCAB.

Since every Apple and Plum on my place was sprayed in winter with tar-distillate, no treatment for insect pests should be necessary round about blooming time; and the coast is clear for preventive measures against Apple scab. Since scab does more than anything else to spoil the quality of the crop and reduce its value, I consider this to be one of the most important operations of the whole season. A heavy crop is of little use unless the fruit is clean. We have had three years in succession in which the disease has been severe. By the law of averages there ought to be some chance of better fortune in the present season; but it would never do to trust to this. Happily, I shall undertake the work with more confidence than in past seasons, because last year's programme of spraying was more successful than any adopted previously. A pre-blossom application, given when the buds were in the pink stage, proved very valuable. It is a comforting fact that, at this stage, spraying is most unlikely to do any damage. All varieties, including Cox's Orange Pippin, will withstand normal Bordeaux mixture (8lb. copper sulphate, 8lb. lime, 100 gallons water) before blooming. There is nothing better to use at this time than freshly-made, home-prepared Bordeaux mixture. After blooming, there is more danger of scorching, and milder fungicides must be used. The excess-lime Bordeaux formula (6-20-100) caused no scorching last year, and only a trifling amount of russetting of the fruit in the case of some varieties. It is certainly not safe, however, for Cox's Orange Pippin, and personally, I do not think it is for Beauty of Bath either. For these sorts the only safe wash appears to be lime-sulphur at a strength of one part to ninety-nine parts of water, with the addition of arsenate of lead. This is a very mild fungicide, and cannot be expected to do so much good as Bordeaux mixture; but it is better than nothing. The excess-lime Bordeaux mixture is rather troublesome to prepare on a large scale, owing to the amount of lime; and I had a good deal of hindrance from blocked nozzles last season. For this reason, I shall

substitute lime-sulphur at one part to fifty-nine parts of water, with arsenate of lead, in some cases, for varieties other than those mentioned above. This specific is no trouble to prepare, and it does not russet the fruit; but it is liable to cause an abnormal dropping of the crop. I have often used lime-sulphur before, but never after a pre-blossoming spraying with Bordeaux mixture, which might make all the difference to the control obtained. The combination seems to be worth trying. The second spraying is, of course, given just after the fall of the petals; and this should be followed by a third about a fortnight later. The full programme will be carried out in the case of varieties particularly liable to scab, such as Worcester Pearmain and Allington Pippin. I think it is quite likely that one spraying would protect such a variety as Bramley's Seedling, which, until recently, has not been subject to scab in most places.

### BLACK CURRANTS NOT TRANSPLANTED.

Every year I insert many cuttings of Black Currants in order to have a supply of bushes to fill the gaps caused each season when the crop is rogued for reversion. In the past winter I had far more two-year-old bushes than was needed for this purpose. As they had made exceptionally good growth, it was decided to grub some of the rows and leave others just as they were to fruit. These now stand in the nursery rows, where they have been since the cuttings were put in about six inches apart in the rows. They will probably bear quite a good crop this summer, as they have not been cut down. I have left bushes in this way before, and they cropped very well. Their being so close together in the rows does not seem to matter; it enables pruning to be done very severely, thus obtaining a good supply of young wood. Except that it is generally convenient, I do not think there is anything to be gained by transplanting Black Currants. Some of the east Norfolk growers, who specialise in this crop, form large plantations by putting in cuttings where the bushes are to stand. I have two plantations in which the bushes stood originally six feet apart in the rows, but are now three feet apart, the gaps having been filled by putting in cuttings. There is no difference in the bushes at the present time. Two-year-old bushes are sometimes advertised as "transplanted stuff." I always feel that this probably means that they were so foul with weeds at the end of the first year that it was easier to transplant them than to clean the land. Anyhow, there is certainly nothing gained by transplanting the bushes before the final shift to their permanent quarters. When I have to buy bushes to make a new plantation, I prefer to have one-year-old specimens. A few bushes of the new variety, Davison's Eight, purchased last autumn, have been planted eight feet apart, and cuttings put in midway between.

### STORED APPLES.

Growers who stored Bramley's Seedling last autumn have had their reward, as they have been selling at 18s. to 25s. per bushel wholesale, which prices are higher than those realised by any of the imported dessert Apples. The quantity on the market must, of course, have been very small, but even so, it is extraordinary that buyers should have been found for these Apples, for the retail price must have been very high. Evidently the time to store Bramley's Seedling is when the crop is unusually short, and not when it is plentiful. In the latter event, unless cold storage is available, so that the fruit can be kept until April, it generally pays better to sell quite early in the autumn. At present I am using Chelmsford Wonder, which has kept very well in an ordinary fruit room. This is not a commercial variety, but there are a few trees in my oldest plantation. With its bright yellow colour and crimson stripes it is quite an attractive cooking Apple, and the flavour is good.

### CANNING FACTORIES.

The business of canning home-grown fruits is making a most promising start. Several factories will be in operation in the coming

season. The movement deserves every encouragement. An enormous amount of imported canned fruit is consumed in this country; and most of it comes in cans which were made here and sent abroad to be filled. With the exception of Pears and Peaches, we can grow fruit which is quite as good for canning as that grown abroad, and, in the case of bush fruits, very much better. There is no reason why the public should not buy canned home-grown fruit instead of foreign. Obviously, any fresh outlet will be greatly to the advantage of growers. In the case of soft fruits, supplies required for canning have to be of much better quality than is necessary for jam-making, and far higher prices are offered accordingly. Only in the case of Apples can a low grade be utilised, as skin blemishes do not matter in fruit which has to be peeled before it is canned. Small grades of Tomatos may also be used, and are vastly superior in flavour to the foreign brands.

### FEATHERED STEMS IN YOUNG TREES.

When forming new plantations of Apples or Plums, I generally buy maiden trees, in order to train them with just the length of stem required. Whilst the head is being made, laterals push from buds all up the stem. This "feathering" is always allowed to remain for two years, as it is said to assist the stem to thicken. Since it would be much less trouble to keep the stems clear of lateral growths from the start, I am glad to see proof that the practice of retaining the feathering for a time is worth while. This comes in the report of an experiment carried out at the East Malling Research Station\*. It was found that the feathering gave a rather sturdier and heavier tree. There was slightly more thickening of the stem, particularly at the collar. The most striking effect, however, was found in the roots, which were more plentiful and wider-spreading on trees which had been allowed to feather than on those which were kept clean-stemmed by rubbing out the laterals in summer. Incidentally, this experiment probably shows why the practice of summer-pruning tends to bring young trees into bearing. The suppression of growths in summer no doubt restricts root formation, and therefore reduces vigour; and anything which does this, in the case of a young, over-vigorous tree, would help to bring it into a fruitful condition. *Market Grower.*

## FRUIT REGISTER.

### PEAR VERULAM.

I HAVE just seen Mr. Hollingworth's note regarding this old Pear, and I am sure it will interest him to know that at Cirencester Park, where I was gardener for over forty years, there is a very old tree of this variety. Its behaviour is identical with that of the tree Mr. Hollingworth refers to in that it has never failed to bear fruit. It, however, bore best biennially, and the year after its great crop was a lean one. Its regular cropping was its chief merit, for so far as my experience goes, the quality of the fruit was of low value. The tree I am writing about is very old, and was probably planted by a gentleman named Gregory, who once had Cirencester Park as a nursery.

A gentleman to whom I showed this tree some years ago, told me the following story: In Worcestershire, the Verulam Pear is called the Black Pear of Worcester, and was so named by King Charles, who once visited Worcester. The Pear was served in a stewed state at a banquet, and was then of a dark colour. The King asked its name and, as no one could tell him, he said, "it shall be called henceforth the Black Pear of Worcester."

The Cirencester tree is a tall, shapely standard. I am told that when grown against a warm wall the fruit of Verulam is of fairly good quality. If that is so, it would be worth while to give the tree this protection, for it is a most reliable cropper. *T. Arnold, Cirencester.*

## VEGETABLE GARDEN.

## SEAKALE.

It may seem strange to state that of all our most important forced vegetables none is more easily cultivated than the Seakale. Given the one essential at the time of blanching—absolute darkness—it certainly is one of our choicest winter and early spring vegetables. Originally a native seaside plant (*Crambe maritima*) it has been grown in this country as a cultivated vegetable since 1753.

The planting season of Seakale is at the end of March and during April. It delights in an open and sunny situation, where the soil is deep and enriched with well-rotted farmyard manure. Lime is also useful as a preventive against disease, but should not be mixed with the manure. Scatter the lime on the surface, ten pounds or so to the rod, and lightly fork it into the soil just prior to planting.

Seakale may be raised from seeds sown very thinly, two inches deep, in drills two feet apart, during April, and the seedlings eventually thinned to stand at eighteen inches apart in the drill. The strongest of these plants should be fit to force the following December, and the others, if planted in good, rich soil, should force the second year.

The better plan, though, is either to purchase year-old plants or good planting "thongs," which are really root-cuttings, i.e., pieces of the Seakale roots, six inches long and as thick as one's finger. Obtained now, the one end will show quantities of little buds ready to burst into growth. These buds should be reduced to two or three, and by the end of May, to one single growth. Have the ground lightly forked over and made level by raking the surface. The root cuttings are then planted with a dibber, eighteen inches apart and twenty-four inches from row to row. When planting see that the crown of the root-cutting is about two inches below the surface of the soil. Encourage all the growth possible by stirring the soil between the rows to conserve moisture and to keep down weeds, and take particular care to reduce the shoots to one on each plant. By October the plants will have finished their growth, the leaves turning yellow and easily parting from the crown at the first sign of frost. Then the roots may be lifted, trimmed, and stored away in sand or ashes ready for use when required. The strongest of the trimmings should be collected, cut into six-inch lengths, laid on their sides embedded in sand or sifted ashes, in boxes, and placed in some cool place free from frost until planting time the following March or April.

For successful forcing the essentials are, a mild heat, not more than 55°, and total darkness. There must be no half measures about the latter. The least ray of light and the whole year's labour will be in vain. A mild hot-bed made up of equal parts of stable manure, and freshly collected leaves, with an ordinary garden frame set on top, will suit admirably. The crowns are planted thickly, i.e., an inch or two apart, in leaf-mould or sifted soil, allowing sufficient head-room for the leaf-stems to develop. The frame light must be well-matted to exclude light, and even over the mats it is advisable to have a foot or so of stable litter.

By following this method, crisp, succulent heads may be had in about a month from planting. To keep up the supply, fresh crowns must be introduced in fortnightly batches to suit requirements.

When the growths are six to seven inches long they should be cut with a small portion of the old stem attached and tied together in bundles until required.

Forcing and blanching in the open is perfectly simple, but the produce is not obtained quite so early. Ten-inch pots that have done service for Chrysanthemums are taken to the Seakale plot and one inverted over each crown. The pots may be surrounded with hot fermenting manure, and in the course of a few weeks well-blanching produce will be obtained. In some of our older gardens the rows are somewhat close, twenty inches or so apart, missing out every fourth row to provide a pathway; on

these beds the manure is spread a foot deep, and Seakale is gently forced in that way; a plantation so treated will continue for several years, but the roots that have been forced in frames or houses are of no further use. The variety Sutton's Ivory White (Fig. 144) is one of the best. H. H. Cook, Reading.

## SOME UNCOMMON VEGETABLES WORTH GROWING.

(Continued from p. 271.)

Couve Tronchuda withstands frost very well indeed, and is invaluable in the garden as a substitute for ordinary Cabbage and a change from Kales, etc., during the winter. Some care is necessary in boiling the midribs, which should be eaten while they are young and tender, otherwise they cease to be like Seakale, and are somewhat less palatable. When properly cooked they have a very decided Seakale flavour, and are greatly esteemed accordingly.

served like Spinach, or used as an ingredient in soups, sauces and salads. It is when mixed with salad, however, that, in my opinion, the leaves are most highly prized. Personally, I would much rather not have it in the garden at all, as it is more nuisance than it is worth.

Labrador Kale (*Brassica oleracea acephala labradorensis*) is a very distinct and prolific Kale, each plant producing, until late in the season, several branches of dark green foliage, with pink mid-ribs, which boil a fine dark green, and are very tender and delicious. The plant is of dwarf growth, about twelve inches, and very hardy. The seeds should be sown out-of-doors, from April to May, to have plants ready for cutting during the following winter.

Mercury, or Good King Henry (*Chenopodium Bonus-Henricus*) is a perfectly hardy and easily-grown vegetable, the leaves of which are used in the same way as Spinach. By earthing up the shoots they may, instead, be blanched and used as a substitute for Asparagus. The seeds germinate quickly, and the blanched shoots are

FIG. 144.—SEAKALE SUTTON'S IVORY WHITE.

The Egg Plant, or Aubergine (*Solanum Melongena*) is another delicious vegetable when properly prepared, but it is not to everyone's taste. The plants require to be started in heat, as the seeds are sown about the end of January or beginning of February. In a warm season the plants will fruit freely under a sunny wall, but generally, a few plants in pots are all that are required. The flesh should be taken out of the skin, minced with a little Mushroom, Tomato, bread crumbs and Parsley. Then add a little butter, replace in the skin, and bake in the oven. Another and simpler method of cooking it is to slice the fruits, which are ready for use in the autumn only, and fry them in oil or butter, with pepper and salt to taste.

Seeds of French Sorrel (*Rumex scutatus*) should be sown in the open in fairly light soil, early in April, in shallow drills made six inches or eight inches apart. The seedlings should be thinned early to produce plants with leaves ready for consumption during the following autumn, say, the end of August to November. Leaves of the finest quality are obtained from plants a year old. These may be cooked and

available for use as above during the latter end of April and early in May. The leaves, if allowed to grow in the ordinary way, may be gathered in May and used as a substitute for Spinach. Sow the seeds during April, in drills made twelve inches apart, and in due course thin the seedlings to one foot apart in the rows. Successional sowings may, if desired, be made during May.

Gardeners have a difficulty in maintaining an unbroken supply of true Spinach (*Spinacia oleracea*) during the whole of the summer, but New Zealand Spinach provides a good substitute. It is prized by many, also, because it lacks the peculiar bitterness of true Spinach.

To obtain an early supply seeds should be sown in gentle warmth in February to produce leaves for consumption from June to October. Outdoor sowings made in April will provide good plants for consumption from July to October and, if necessary, another sowing may be made out of doors in May to provide plants for use in August to October. The growth of the plant is rapid, and there should be no stint of water at the roots in dry weather. The seedlings should be transplanted when

ready, in rows made four feet asunder, the plants themselves being three feet apart in the rows. From the gardener's point of view, next to Spinach Beet (Perpetual Spinach) *Tetragonia expansa* is one of the best possible kinds of Spinach to have in the garden.

Another useful but rare substitute for Spinach is Purslane (*Portulaca oleracea*), a dwarf, annual plant with succulent leaves and stems which, when cooked like Spinach, constitutes a most delicate dish. The leaves are also used raw in salads. For obtaining supplies in summer and autumn sow the seeds from the middle of May to August.

Potato Onions (*Allium Cepa aggregatum*) are underground Onions. If they are planted in March in well-prepared, rich ground, free from any kind of long manure, and treated like Shallots, they will produce a welcome crop of early Onions, ready for use in July to August. They are not good keepers, but are excellent for eating raw in salads or for cooking purposes. They are indeed invaluable for use over a period of the year when other Onions are scarce.

The bulbs should be dibbled in the soil about ten inches apart, in rows from twelve inches to fifteen inches apart, the bulbs themselves being covered to a depth of two inches. It is the custom, in the south of England, to plant Potato Onions on the shortest day and lift them on the longest, but where this is done there is a great danger of loss in the crop during a severe winter. When sown in March, such losses are few and far between. It is surprising these Potato Onions are not grown more often in English gardens than they are. Once established, it is an easy matter to save the smaller bulbs and offsets for planting when the crop is lifted in August. In Cornwall the crop is ripe and ready for lifting in July. *E. A. Saunders.*

(To be continued.)

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Experiment with Seed Potatoes.**—Mr. W. F. E. Secley, Headmaster at Balsall Street Central School, near Coventry, has endeavoured to emphasise the point that the vigour of Potato stocks may be maintained for a long time, if not indefinitely, by selecting tubers from vigorous roots, lifting them while the haulms are green and, after a few hours' exposure to sunshine, setting the tubers up in sprouting trays until planting time. When the experiment was started three years ago, the sprouts were reduced to one per tuber, retaining the one from the "rose eye," which is invariably the stronger. The following year it was noticed that seventy-five per cent of the tubers produced only one sprout, the other eyes remaining quite dormant. During the third year ninety-five per cent of the tubers produced only one sprout, and although other eyes were visible they had almost disappeared. *H. Dunkin, Horticultural Adviser, Warwickshire County Council.*

**Salvia pseudo-coccinea.**—Some little time ago, a *Salvia* was given me to name by those in charge of an exhibit by Messrs. Skelton and Kirby. I knew it was very close to *Salvia coccinea*, and in the course of my researches, found that it was originally named as above by Jacquin (*Collectanea*, Vol. 2, p. 302). There is a figure of it in *The Botanical Magazine* of 1828 (t. 2864), so that will give an idea when it first made its appearance in this country. The plant is a native of South America, and Humboldt found it in New Andalusia, of that country. The specimens figured in *The Botanical Magazine* were grown in the Glasgow Botanic Garden to which the plant was sent by Baron de Schack, from the Island of Trinidad. It differs from *S. coccinea* chiefly by growing very much taller. In Nicholson's *Dictionary of Gardening* it is reduced to *S. coccinea* var. *pseudo-coccinea*. The ovate leaves and scarlet flowers are much the same in both forms. *J. F.*

## SOCIETIES.

### ROYAL CALEDONIAN HORTICULTURAL.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on the 5th inst., Mr. W. J. Thomson, President, in the chair.

A lecture, illustrated by lantern slides, on "Some Recent Developments in the Theory of Forcing," was delivered by Professor J. M. F. Drummond, M.A., F.L.S., of Glasgow University. Professor Drummond referred to three modern developments, namely (1) treatment by ether, to a mixture of which with ordinary air the plants were exposed for from twenty-four to forty-eight hours previous to the usual forcing process; (2) hot water bath treatment, in which the plants were plunged in water at from 95° to 105° Fahrenheit, for from twelve to sixteen hours previous to forcing, and (3) control of the daily duration of the daylight. The treatment varied, of course, with the kind of plant, time of year, etc., but by either of the first-mentioned plans the flowering of plants could be advanced considerably when compared with the ordinary methods of forcing, and with a considerable saving in heating and other expenses. On the continent both forms of treatment had proved successful on a commercial scale. Under the third method of treatment it was found that by restricting the daylight to from ten to twelve hours daily, many plants flowered some weeks, or even months, before the normal time. The lecturer stated that our knowledge of the subject was still rudimentary, but by these experiments the prospect of much greater control over the time of flowering had been largely increased.

The exhibits were: Orchids, etc., from Mr. D. MARQUIS, Inveresk Gate, Musselburgh; Cyclamens, from Mr. D. EDGO, Balerno; Dawe's Champion Rhubarb, from Mr. J. W. SCARLETT, Sweethope, Musselburgh (to all of whom cultural Certificates were awarded); Cornus Bowhill Scarlet, from Mr. F. GLASS, Greyhouse, Murrayfield; *Trillium grandiflorum*, from Miss BARTY, Edinburgh; and *Schizanthus*, from Mr. J. A. SWORD, Inverlaimond, Cramond. The prizes for spring bulbs were awarded to Mr. P. BELL, 4, Churchill Place, Edinburgh, and Mr. A. C. BEATSON BELL, 15, Comely Bank Grove, Edinburgh.

### PAISLEY FLORISTS'.

THERE was an excellent display of flowering bulbs and pot plants at the Paisley Florists' Society's annual spring flower show on the 9th inst. The competitive section consisted of forty-seven classes, and while the number of entries were approximately the same as in 1926, the quality of the exhibits was of a higher standard. In the Hyacinth classes, Mr. DUNCAN GRAHAM, gardener to ALEX. ROBERTSON, Esq., excelled with three Hyacinths in a pot, and was awarded the "Highest Cultural Certificate of Merit" in addition to the first prize in its class. Mr. GRAHAM was also successful in the class for six Hyacinths, two pots of Daffodils (Van Waveren's Giant), three vases of Daffodils, two pots of *Primula obconica*, and one pot each of *Cineraria grandiflora* and *Cineraria stellata*.

Other prominent prize winners were Messrs. E. G. ROSS, JOHN HOUTON, A. MACGREGOR, G. CAMPBELL, JOHN BROWN, JOHN BOWIE, T. HARVIE, Mrs. THOMSON, J. POPE and W. JACKSON.

Non-competitive exhibits were varied and interesting. The CORPORATION OF PAISLEY (Mr. I. M. Fleming, Superintendent) exhibited a choice collection of pot plants which occupied the platform, and Sir JOHN REID, Ardencraig, Rothesay (gr. Mr. John Davidson) staged twenty-five vases of Daffodils.

A small group of alpinas was exhibited by Mr. D. W. KERR while Mr. JOHN A. HOLMES, Formakin, contributed a fine collection of flowering shrubs.

### ROYAL HORTICULTURAL OF IRELAND.

APRIL 6 AND 7, 1927.—The Show held in the Covered Court, Earlsfort Terrace, Dublin (by kind permission of the Earl of Iveagh,) proved a very successful function, the glass roofed building, with its attractive Ivy-draped roof, being filled to the utmost limits of space with exhibits of excellent quality, public attendance on the two days being very large.

Dividing the schedule into five sections, under which judging was conducted, the first comprised twenty-three classes of alpinas and plants generally. Mrs. ANDREW JAMESON, Sutton House, Co. Dublin (gr. Mr. P. Cullen), won Mrs. Butler's Challenge Cup with a dozen pans each of a different species, and also won Major Butler's Cup with twelve pots or pans not exceeding four inches diameter. For nine pots or pans the winners were Miss JOHNSTON, Bray, HARPER SCAFFE, Esq., Dalkey, and Miss ABBOTT, Santry, in the order placed. In the class for the best display of alpinas on a table space twelve feet by four feet, competing for the Challenge Cup presented by Lady Greer, Mrs. BUTLER led, with Miss WYNNE, Avoca, Co. Wicklow, second, and Mrs. B. HAMILTON, Raheny, Co. Dublin, third. For a dozen hardy Primulas, distinct, the Farabond Cup was won by Miss WYNNE. Mrs. A. JAMESON, second, and Mrs. A. WEST, Kiltcroney, Bray (gr. Mr. C. Coster), third.

*Primula obconica* made a great display, WISDOM HELY, Esq., Oakland, Rathgar (gr. Mr. J. H. Orr) having the best six, with LORD CLONCURRY (gr. Mr. W. Hall), and Major KELLY, Montrose, Donnybrook (gr. Mr. J. McDermott) placed as named. For *Deutzias*, huge plants in grand form, WISDOM HELY, Esq., F. V. WESTBY, Esq., Roebuck Castle, Dundrum (gr. Mr. F. Simmons), and Major KELLY, won respectively. For three pots of *Mignonette* Mr. HELY excelled, the Hon. GORDON CAMPBELL (gr. Mr. J. Cook), and Captain B. DALY (gr. Mr. J. Murtagh) being next best. For *Freeseas*, six pots, the prizes were awarded, in order, to Sir FREDK. W. SHAW (gr. Mr. E. Thompson); Mrs. MCCONNELL (gr. Mr. M. Carolan); and Madame FOTRELL (gr. Mr. W. Taylor). For *Arum Lilies*, pots up to twelve inches diameter, Madame FOTRELL excelled, with grand specimens, over WISDOM HELY, Esq. (also very fine). Mr. HELY showed six superb plants of *Spiraea Queen Alexandra*, and repeated his success with six *Schizanthus*, Major KELLY and Madame FOTRELL following. Messrs. DRUMMOND'S LTD.'s first prize for twenty-four pots or pans of bulbous subjects was won by Major KELLY, with Madame FOTRELL next. Six pots of Tulips, single, and the same number of double sorts, were unusually well shown by WISDOM HELY, Esq.; Hyacinths, too, were better than of late years, Major Kelly having the best dozen, distinct, and C. W. PARR, Esq. (gr. Mr. J. Keegan), the best six. For six bowls or pans of bulbs grown in fibre, distinct, the Rt. Rev. and Hon. B. J. PLUNKETT (gr. Mr. P. D. Reid), won first prize; Major KELLY second.

The Daffodil classes were not particularly well filled. In the premier class for thirty varieties, in competition for the Lord Ardilaun Perpetual Challenge Cup, there were two entrants, Mrs. WEST being the winner for the fourth year in succession; Miss E. B. HELY-HUTCHINSON, Seafield, Donabate, Co. Dublin (gr. Mr. J. Shekleton) coming second. These exhibitors were the chief winners in the other classes, with the addition of C. W. PARR, Esq.; the Misses BIRD, Churchtown House, Dundrum (gr. Mr. J. Smith), and WISDOM HELY, Esq. Mrs. STEPHENSON, Cranford, Dublin, had the best dinner table decoration of Daffodils; Miss WYNNE, second; Mrs. MCCONNELL, third.

Hardy cut flowers, shown in vases, made a brave display; for a collection of twenty-four shrubs not excluded, exhibited in competition for Captain Riall's handsome Challenge Cup, Mrs. STEPHENSON excelled, the donor of the Cup being placed second, with F. V. WESTBY, Esq., third; conspicuous in Captain RIALL's collection were graceful branches of *Acacia dealbata*, which is so happy in the kindly Wicklow climate. For a collection of twelve kinds, the Misses BIRD, Mrs. A. JAMESON (gr. Mr. Osman), and C. W. PARR, Esq., won as placed, and for the

collection of six kinds, Mrs. RICHARDSON, Rosedale, Shankill; Miss SHACLETON, Lucan; and Miss WYNNE, were placed in the order named. Prizes presented by Messrs. Watson, Killiney Nurseries, Co. Dublin, for a collection of hardy flowering shrubs were won by Captain RIALI (gr. Mr. T. Webster), Miss HELY-HUTCHESON, and Major KELLY in the order named; while for a smaller collection, Sir FREDK. SHAW, Mrs. A. JAMESON, and Captain DALY were the prize winners; and for six vases of Rhododendrons, G. VAUGHAN HART, Esq., Stillorgan, was the only entrant.

Twelve blooms of Roses were exceedingly well shown by Mrs. A. WEST, but there was little to choose between her set and that from WISDOM HELY, Esq. There was a great display of hardy Primroses and Polyanthus, the principal prize winners being Mrs. BUTLER, Miss SMYTH, Captain RIALI, Miss RUTHERFOORD, and Messrs. PARR and VAUGHAN HART. Although but two exhibitors competed in a new class for Violets, much interest was evinced in it, the Challenge Bowl presented by Mrs. H. Bland, Abbeyleix, having been designed and made by Mr. Omar Ramsden, designer and maker of the King's Arms dish for the New York Cathedral, this being won by Mrs. A. WEST, Miss RUTHERFOORD being placed second.

Nineteen classes for fruits and vegetables completed the schedule. Exceptionally fine Newtown Wonder Apples were shown by LORD CLONCURRY, Sir FREDK. SHAW and CHAS. MARTIN, Esq. Pears, not so good, were best shown by E. D'OLIER, Esq., LORD CLONCURRY and H. E. JOLY, Esq., while the leading prize winners in the vegetable section were LORD CLONCURRY and Madame FOTTELL.

The leading feature among non-competing displays was the collection of newer Rhododendrons, including alpine species from China and Thibet, contributed by the MARQUIS of HEADFORT, the President (gr. Mr. W. E. Trevithick), all lifted from the open as growing at Headfort House, Co. Meath. For this a Gold Medal was unanimously awarded, and as the display was considered the best amateur exhibit of rare plants or flowers it further received the Silver-Gilt Medal presented by *The Gardeners' Chronicle*. A Gold Medal was awarded to Mr. J. LIONEL RICHARDSON, Waterford, for a remarkably fine stand of Daffodils, embracing the choicest and newest varieties. Silver-Gilt Medals were awarded to Messrs. WATSON, LTD., The Killiney Nurseries, for a pretty group in which colonies of Koster's Orleans Polyantha Rose formed a striking feature, and for a fine group from the Rt. Rev. and Hon. B. J. PLUNKETT, St. Anne's, Clontarf, the latter having colonies of *Bilbergia nutans* and *Veltheimia viridiflora* on a groundwork of *Anemone hepatica*, with flowering shrubs above. A choice collection of foliage and flowering plants from the Ballsbridge Nurseries, Dublin, set up by Messrs. CHAS. RAMSAY and SON, received a Silver Medal. Bronze Medals were awarded to the Hon. Mrs. CHAS. GUINNESS, for a collection of splendidly-grown Cyclamens, and to Mr. W. H. ODLUM, Ardmore, Bray, for a similar set; Miss LAYNG, of Cork, received a Bronze Medal for a miniature model garden.

### FALMOUTH SPRING SHOW.

This show, which was held at the beautiful Gyllyngdune Gardens on April 6 and 7, was opened by His Excellency the Governor of Kenya Colony, Sir Edward Gregg, K.C.V.O., C.M.G.

This event of the Cornish Riviera emphasises more than any other western show the possibilities of the west, which is a veritable paradise for the plant lover. Choice plants are grown in creeks and other favoured spots where frost is practically unknown.

The trade was represented by exhibits from Messrs. R. VEITCH and SON, Exeter, Messrs. RUSE and THE DEVON ROSERY. Narcissi were well shown by Mr. J. C. MARTIN, Truro, and Messrs. BARR and SONS, King Street, Covent Garden, London.

Other trade exhibits included a rockery by Messrs. MAXWELL and BEALE, with many

charming dwarf alpines and Heaths; Narcissi, by Mr. W. J. BARR, Bournemouth, and general nursery stock by Mr. W. DAVIS, Falmouth. Good honorary exhibits were put up by J. POOL, Esq., Falmouth, and Mrs. HOWARD FOX, Rosehill, Falmouth.

Competition was very keen in the class for flowering shrubs, the winning collection of Mrs. N. COLBORNE, Bosahan, included *Clematis indivisa*, *Datura sanguinea*, and *Drimys aromatica*, whilst those sent by Mrs. C. HERT, Trebah, included *Exochorda grandiflora*, *Erica melanthera* and *Grevillea Priessii*; the third prize group by Mrs. M. C. ROGERS, contained the sweetly-scented *Daphne indica* and *Prostranthera*.

Another feature of the exhibition was the exhibits of the FALMOUTH CORPORATION, which included fine *Cinerarias*, *Primulas*, *Cyclamens*, stove plants and Orchids.

Commercial growers of Narcissi were well-represented in the classes for eighteen bunches and twelve bunches respectively. The PARK FARM, Truro, won the first prize easily with splendid bunches of Osprey, Firetail, Herbert Smith, Horace, Medusa, Golden Emperor and The President; Mr. F. G. LAWSON was second.

The other Daffodil classes were better filled than ever before, and here Mr. J. H. MORRIS was the outstanding exhibitor, obtaining the first place in each class. In addition to numerous seedlings, Mr. MORRIS showed well-grown examples of Hera, Pax, Firetail, Tenedos, Miss Willmott, Herbert Smith and Dauchene, the last-named having an immense trumpet.

A shrub novelty of the show was *Petrea volubilis*, with beautiful blue flowers, shown by Miss DAUBUZ, of Killio, Truro. The same exhibitor showed some excellent blooms of *Magnolia Campbellii*.

Any description of Falmouth show would be incomplete without a reference to the extraordinary exhibits of Camellias: the first prize for Camellias was won by Miss DAUBUZ, with good examples of *C. reticulata*, *C. anemonaeformis*, *C. Countess of Orkney*, *C. Fatima*, etc. Other flowers well shown were Anemones, Tulips, Wallflowers, Kurume Azaleas and Freesias. The premier award for *Schizanthus* went to FALMOUTH CORPORATION (gr. Mr. Gill).

The first prize in the largest class for Rhododendrons was won by R. BARCLAY FOX, Esq., with good blooms of *R. intricatum*, *R. Glory of Penerrick*, *R. Kingianum*, and a contrast between the huge *R. ino-grande* and the small *Williamsianum*. Mrs. HERT, of Trebah, was second with *Pride of Penerrick*, *Beauty of Tremough*, *Bodartiana*, *R. fulgens*, etc. With glorious weather and a charming setting, the show attracted a record attendance.

### KILMARNOCK SPRING SHOW.

THE fifth annual bulb show of the Glenfield and Kennedy Horticultural Society was held at Kilmarnock on Saturday, the 2nd inst. A brilliant display of Hyacinths, Tulips and Daffodils was forthcoming. The entries, which numbered five hundred, created a new high record. Competition was particularly keen in the Tulip section and the large classes of Trumpet Daffodils, where the exhibits in each ranged from eleven to thirteen bowls or pots.

There were sixty-six classes in the prize schedule, forty of which were open to all. The three Challenge Cups offered to the competitors with the highest aggregate number of points were awarded as follows:—Ferguson Cup for Hyacinths, to Mr. W. WINNING; Craig Cup for Tulips to Mr. WILLIAM WATSON; and the Crawford Cup for Daffodils to Mr. JAMES COCHRANE. Other winners of first prizes were Messrs. J. DODDS, R. BROWN, J. CRAIG, I. BOYD, D. DRUMMOND, J. HIGGET, C. BARCLAY, JAMES SMITH, R. WILSON, J. GILMOUR, C. ROXBURGH and J. CURRIE.

Mr. JAMES SMITH, a local amateur, staged an exhibit of forty newer varieties of Daffodils in pots, which was the most attractive feature of the show. The outstanding varieties were Beppey, Liberty, Solfatare, Lucinius, Mrs.

J. H. Krelage, Empire, Carran, Gold Nut, Noble, Golden Beauty, Lady Moore, Ivorine, Bath's Flame and Gipsy Queen.

Modern types of Daffodils were also prominent in the exhibit of Mr. J. MONTGOMERY CRAWFORD, Highfield Bulb Farm, Barassie. The flowers were staged in vases, and the best specimens included Santa Maria, Decorator, Tenby, Gaiety, Golden Gate, Spring Glory and *Incomparabilis* varieties Brilliancy, Elaine and Stella.

The SCOTTISH WHOLESALE CO-OPERATIVE SOCIETY'S NURSERIES, West Kilbride, exhibited a choice collection of Azaleas, Hyacinths, Tulips, Daffodils, etc., and other flowers.

### MORAY AND NAIRN FORESTERS'.

THERE was a large attendance of members at the annual general meeting of this Society, which was held in Forres, Morayshire. Mr. John Clark, head forester to the Duke of Richmond and Gordon, on the Gordon Castle Estates, occupied the chair.

The Secretary (Mr. C. Asher, Gordon Castle) submitted an annual report giving an admirable account of the year's work done by the Society. By the kind permission of the proprietors, the estates visited during the summer months were: Dunphail, Blackhills, Aberlour, and Cathay House, Forres; there was also the annual picnic to Nairn—a most successful outing. During the winter, meetings were held in Elgin and Forres respectively, when the subjects discussed included: "Forest Insects," by Mr. T. McEwan; "Light in Relation to Plant Growth," by Mr. E. S. Grant; "Humus as a Soil Improver," by Mr. H. A. Brookman; "The Forest Organism," by Mr. A. Watt; and "Observations by a Timber Merchant," by Mr. A. Merchant. Mr. E. S. Grant, treasurer, submitted a balance sheet, which showed a substantial increase in the Society's funds.

Both report and balance sheet were considered highly satisfactory.

The election of office-bearers for the ensuing year was then proceeded with. Mr. E. S. Grant, Altire, was appointed President in succession to Mr. Clark, Gordon Castle. Mr. Grant, in accepting office, paid warm tribute to his predecessor and thanked the members for the honour conferred on him. Mr. F. Machray, Dunphail; Mr. A. Morrison, Brodie; and Mr. C. Bain, Burgie, were appointed vice-presidents. Mr. C. Asher, Gordon Castle, was re-elected secretary. Mr. A. Ross, Forres, was elected treasurer; Mr. J. Robbie, Monaghty as Librarian, and Mr. J. McEwan, Teindland, as editor of the *Journal*. The management Committee for the ensuing year consists of Messrs. McEwan, Chalmers, Robbie, Sutherland, Feaks, Clark, Innes, McKenzie, Stewart and Noble.

In his valedictory speech, Mr. Clark, the retiring President, spoke highly of the work done during the past year, and particularly mentioned how deeply they were indebted to proprietors for allowing them to visit their estates, and the great kindness they had received during these visits. He also warmly thanked those who had so willingly lectured to them during the winter months. Heartly thanks were awarded Mr. Clark for his successful presidency.

### BRITISH CARNATION.

THE Floral Committee of this Society visited Messrs. A. F. Dutton's establishment at Iver, on April 11, to inspect the new Carnation Mrs. A. J. Cobb growing in the raiser's nursery, and awarded it the highest possible award, a First Class Certificate; eighty-eight points were awarded, or three over the necessary number.

Lady Margaret Boscawen (Messrs. LOWE and SHAWYER'S, of Uxbridge) was also inspected, and received a First Class Certificate, securing eighty-five points.

Mrs. A. J. Cobb was also given an Award of Merit by the B.C.S. and R.H.S. on Tuesday the 12th inst., while W. H. Page, raised by Mr. W. H. PAGE, of Hampton, Middlesex, gained an Award of Merit on the same date.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MR. T. R. BUTLER presided at the monthly meeting of this Society, held at the R.H.S. Hall, on Monday, April 11. Thirteen new members were elected. Five members withdrew interest from their deposit accounts amounting to £14 6s. 8d. The death certificates of two deceased members were produced, and the sum of £51 11s. 5d. was passed for payment to their respective nominees. The sick pay for the month on the Ordinary side was £137 16s. 2d., and on the State side £139 2s. 6d.; maternity claims amounted to £13.

The sum of £31 15s. 0d. was made in grants to six members for extra benefits from the State Section, and nine other cases were considered.

The Secretary, Mr. A. C. Hill, 35, Alexandra Road, West Kensington Park, W.14, stated that all reports and balance sheets had now been sent out, and persons interested might receive a copy on application to him.

### TAMAR VALLEY COMMERCIAL SHOW.

FOLLOWING the lead given by the growers in West Cornwall and the Isles of Scilly, who have recently held their fourth Spring Show, the market gardeners in the Tamar Valley have proceeded on similar lines and the first Spring Show was opened at Plymouth on Wednesday, the 30th ult.

The season, so far as outdoor flowers are concerned, has been rather late this year, and this accounted for the large number of entries received from the West Cornwall district, as the bulk of the crop there was not forward enough for the Penzance Show at the beginning of March. The exhibits, which consisted for the main part of Narcissi, were more numerous than the most optimistic of the show promoters expected, and the capacity of the two large halls was taxed to the limit. The trade exhibits were fully representative; nurserymen, florists, horticultural sundriesmen and firms who specialise in the various kinds of packages for fruits, flowers and vegetables had stands around the sides of both halls, while the competitive exhibits were displayed on two stagings down the centre and in the ante-room, even the staircases being utilised.

Educational exhibits included one from Long Ashton, displaying the various problems connected with Strawberry culture; an exhibit from Seale-Hayne Agricultural College on insect and other pests of the various flowering bulbs; while the Agricultural Education Departments of both Devon and Cornwall put up comprehensive stands dealing with the work done in the two counties. The show was opened on the first day by the Lord Lieutenant of Cornwall (J. C. Williams, Esq.), while Mrs. J. E. C. Boulds performed the opening ceremony on Thursday.

The attendance on both days was very satisfactory, and the show may be said to have proved an unqualified success from all points of view. Great credit is due to Mr. J. E. C. Boulds who, in his capacity as Chairman of Committee, threw himself wholeheartedly into the work, and so imbued his colleagues with his enthusiasm that the result was almost a foregone conclusion from the commencement. Mr. C. A. Hall, of Saltash, made an excellent Secretary, while the two County Horticultural Superintendents, Mr. H. W. Abbiss (Cornwall) and Mr. D. Manning (Devon), assisted as Organising Secretaries. The success of the show makes it almost a certainty that it will become an annual affair, and as such it cannot but be a valuable asset to the flower- and fruit-growing industry of the Tamar Valley.

A full programme of addresses and conferences on the afternoons of both days was carried out, addresses being given by Messrs. G. H. Hollingworth (Agricultural Organiser for Gloucestershire), and Frank May of Cheltenham, on "A Successful Growers' Co-operative Market," and by Messrs. Sidney Cooke, St. Nicholas Market, Bristol, and B. L. Wolf, Ministry of Agriculture, on "Packing and Marketing of Produce," on the Wednesday afternoon. The Thursday was taken up by a meeting of the

Tamar Valley Growers' Association with representatives of the Railway Companies, when matters of interest were fully discussed, followed by an address by Captain R. Wellington (Chairman of the Fruit and Vegetable Committee, Devon N.F.U.), Messrs. F. M. Jesty and C. Hoskin (County Secretaries for Cornwall and Devon Branches of the N.F.U.) on "How the N.F.U. can assist the Grower." The inclusion of addresses and conferences on topical subjects in connection with a show of this description adds immensely to its educational value, and is a matter which could be extended to similar shows in other parts of the country.

The exhibits were naturally strongest in the Commercial Section, but there was a fair number of amateurs who showed some very fine specimens. Among others in this section were the following: Captain H. G. Hawker, Ermington, who took first and special prizes in the class for pot plants, and also showed some fine vases of Narcissi; Mrs. J. E. C. Boulds led for table decoration; while the first prize for bottled fruits was carried off by the HIGH BICKINGTON WOMEN'S INSTITUTE, with Miss BARBERRY, Camborne, and Mrs. DONEY, Bere Alston, second and third respectively.

It is a noteworthy fact that although several of the Narcissus classes were open to amateurs yet the prizes were won entirely by commercial growers, indicating the keen interest now being taken by the latter with reference to the presentation of flowers to the best advantage.

An exceptionally fine feature of a really fine show was the Educational Section. Several collections of new and recently introduced varieties were staged, and these aroused very keen interest on the part of the visitors. Lectures and conferences on subjects connected with the industry were arranged for both afternoons and bunching and tying competitions were conducted in the evening.

A show of this kind cannot fail to be of benefit to the commercial and amateur growers of spring flowers as well as enabling the urban population to inspect the produce of the Tamar Valley and other parts of Cornwall and Devon.

### SPALDING BULB GROWERS'.

THE annual Daffodil show of the Spalding Bulb Growers' Association was held in the Exchange Hall, Spalding, on Saturday, April 9, and the exhibition surpassed that of last year, both in quality and quantity.

The most successful exhibitor was Mr. R. D. WELLBAND, one of the oldest growers at Spalding, who won the Spalding Bulb Company's Cup for the best collection of Daffodils in the show: the Collingridge Cup; the Gerald Da Costa Cup, and the Spalding Bulb Growers' Association's Cup, in addition to one presented by himself, whilst he also carried off numerous first and second prizes.

The Gold Medal for the best single specimen went to Messrs. J. T. WHITE AND SON, of Spalding, for a variety named John Evelyn. Messrs. J. T. WHITE AND SON and Messrs. H. WHITE AND SONS, of Spalding, carried off the awards in the section for boxes of blooms packed for market. Mr. F. BAXTER was awarded the Bert Baxter Cup for a remarkable display of Daffodils. Mr. O. W. D'ALCORN, Mr. B. BAXTER and Mrs. H. M. BATES, all of Spalding, were among other successful exhibitors. An outstanding feature at the show was the Spalding Bulb Company's stand, which was awarded a Gold Medal.

The following were the awards in the open classes:—Spalding Bulb Company Cup, for the best exhibit in the show, Mr. R. D. WELLBAND; William Hardy Cup, Messrs. H. W. WHITE AND SONS; J. Collingridge Cup, Mr. D. R. WELLBAND; J. Swift Cup, Messrs. J. T. WHITE AND SON; R. D. Wellband Cup, Mr. R. D. WELLBAND; Gerald Da Costa Cup, Mr. R. D. WELLBAND; Bert Baxter Cup, Mr. F. BAXTER; Spalding Association Cup, Mr. R. D. WELLBAND; Gold Medal, for the best new variety, Messrs. J. T. WHITE AND SON; Gold Medal, for the best trade stand, SPALDING BULB COMPANY.

Collection of Daffodils: First, Mr. R. D. WELLBAND; second, Messrs. J. T. WHITE AND SON. Trumpet Daffodils: First, Messrs. J. T. WHITE AND SON; second, Mr. R. D. WELL-

BAND. Short-cupped Daffodils: First, Mr. R. D. WELLBAND; second, Messrs. F. BROWN AND SON. Small-cupped Daffodils: First, Mr. R. D. WELLBAND; second, Mr. O. W. D'ALCORN. Box of Trumpet Daffodils: First, Messrs. H. W. WHITE AND SONS; second, Messrs. J. T. WHITE AND SON. Box of Short-cupped Daffodils: First, Messrs. J. T. WHITE AND SON; second, Messrs. H. W. WHITE AND SONS. Box of Small-cupped Daffodils: First, Messrs. H. W. WHITE AND SONS; second, Messrs. J. T. WHITE AND SON. Bunch of Trumpet Daffodils: First, Messrs. J. T. WHITE AND SON; second, Mr. O. W. D'ALCORN. Bunch of Short-cupped Daffodils: First, Messrs. J. T. WHITE AND SON; second, Mr. O. W. D'ALCORN. Bunch of Small-cupped Daffodils: First, Messrs. J. T. WHITE AND SON; second, Mr. B. BAXTER. Collection of Daffodils, limited to members of the Association owning three acres of bulb land: First, Mr. F. BAXTER; second, Mr. R. POCKLINGTON. Collection of New Varieties: Mr. R. D. WELLBAND. Single Specimen of a New Variety: First, Messrs. J. T. WHITE AND SON. Bowl of Daffodils: First, Mrs. H. M. BATES; second, Messrs. J. T. WHITE AND SON.

### INSTOW FLOWER SHOW.

THE sixth of the series of spring shows organised by Miss K. Hinchliff, of Worlington House, was held in the Rifle Hall, Instow, North Devon, on the 30th ult. The exhibition was held on the usual lines, that is to say, no prizes were offered and none of the exhibits were judged. In extent the display was larger than on any previous occasion, and the attendance was also much greater than in previous years, as people in the surrounding district are beginning to appreciate the fine displays provided.

In the section for outdoor-grown Daffodils, each exhibitor displays his or her blooms in one group, only one vase of a variety being allowed, although there may be a number of blooms in the vase. The effect produced by this method is much better than is usually seen and also there is much less repetition. There were two outstanding blooms on this occasion, one, a magnificent example of *Narcissus Fortune*, four-and-one-eighth inches across, exhibited by Mr. Seymour Cobley, and the other a particularly fine example of *Beersheba*, just over five inches across, staged by Miss HINCHLIFF.

Mr. COBLEY put up a splendid group of thirty-six distinct varieties, mostly new seedlings or varieties not yet in commerce. Needless to state, this exhibit was of very great interest to Daffodil specialists. It included flowers of *Daphne*, *ornatus maximus*, *Pluto*, *Nellie*, *Crocus*, *Robespierre*, *Hopeful*, *Medusa*, *Lanarth*, and *Bridget*. The Rev. T. BUNCOMBE, of Black Torrington, presented a representative collection of twenty-seven varieties, many of them his own seedlings, but including such fine named sorts as: *Macebearer*, *Eve*, *Duchess*, *Victory*, *Morning Glory*, *The Dame*, *Glorious* and *Cicely*.

As her garden is close to hand, Miss HINCHLIFF was able to put up a large group of nearly sixty varieties of Daffodils, including *Chaucer*, *Barcorolle*, *Virgil*, *Black Prince*, *Crocus*, *Queen Sophia*, *Flame*, *Mascotte* and *Dosoris*; her principal *Leedsii* varieties were *Irish Pearl*, *Helga* and *Lord Kitchener*, while conspicuous among the Trumpet varieties were *Burgomaster Max*, *Lady Primrose*, *Emir*, *Mrs. Dodd*, *Mrs. R. Sydenham*, *Gwendal* and *Golden King*. In addition, this group contained beautiful flowers of *Buttercup* and a particularly fine vase of *Grand Monarque*. Mrs. DODD, *Windycroft*, contributed several vases of *Tazetta* varieties, notably *Redchief* and *Jaune a Merveille*, associating these with the larger flowers of *J. H. Krelage*, *Lord Kitchener*, *Noble*, *Alice Knights* and *Golden Bell*.

Mrs. HINCHLIFF, *Hillsleigh*, also exhibited Daffodils and other cut flowers, the latter including various *Anemones* and the wild yellow *Tulipa sylvestris*. Her principal Daffodils were *Mernaide*, *Southern Gem* and *Firebrand*. Mrs. MOYSES, of *Weare Gifford*, showed a few well-grown Daffodils and various spring flowers, while Miss WHITE-ATKINS and Mr. H. MILES were other exhibitors, the last-named showing

Violets in very fine form. Coloured Primroses were well-shown by Mrs. L. WHITE-ATKINS, Mr. D. HOYLES and Miss HINCHLIFF, the latter exhibiting fine blue flowers of the St. Asaph strain.

Groups of plants in pots, composed chiefly of Cinerarias, Pelargoniums and Richardias, came from Mrs. HINCHLIFF, Mrs. CRITCHLEY-SALMONSON contributed Azaleas and Primulas, and Mr. MILES showed several varieties of Lachenalias. LADY CHICHESTER sent Freesias and Cyclamens, and Mr. T. JENNINGS was also a prominent exhibitor of the last-named flower. Viburnum Carlesii and numerous Heaths were the principal features in a group of flowering shrubs exhibited by Miss WHITE-ATKINS, while Miss HINCHLIFF showed a number of Skimmias.

Mrs. LANE, Miss ROUSE and other ladies exhibited bulbs grown in fibre, thus providing a very interesting little section that showed how well bulbs may be grown in the home.

Comparatively few fruits were exhibited, but Col. EVAT's dish of Belle de Pontoise Apples arrested attention, and considerable interest was displayed in the fruits of Bramley's Seedling shown by Miss HINCHLIFF and the Rev. STEVENS-GUILLE, as well as in the examples of Newton Wonder and Annie Elizabeth sent by Mr. H. MILES, and creditable specimens of several varieties contributed by Nurse JOHNS.

A small admission fee is charged at this exhibition, and all the profits are handed over to the Instow Rifle Club, which has already benefited to the extent of about £25.

## Obituary.

**Harry Alderman.**—We learn with regret that Mr. Harry Alderman, gardener to the Hatfield family at Morden Hall, Morden, died on Monday, April 4. For nearly half-a-century Mr. Alderman was one of the leading gardeners in mid-Surrey and took part in all horticultural activities in the Wimbledon and Morden district. His kindly earnestness in all he undertook and the readiness with which he assisted young and enthusiastic gardeners will be remembered by those who knew Wimbledon when fine gardens and estates were owned there by the Peek, Schlusser, Devas and Czarnikow families. Mr. Alderman had his first experience of gardening under his father at Woodhayes Gardens, Wimbledon, and after gaining knowledge at various establishments he returned to Wimbledon to fill a post in the gardens at Canizaro House, whence he obtained the appointment of gardener to the late Mr. Hatfield at Morden Hall, a position he filled under other members of the Hatfield family up to the time of his death, a period covering in all forty-four years. The funeral at Morden Parish Church on April 9 was largely attended by relatives, representatives of various horticultural and other societies to which the deceased had belonged, and by numerous horticulturists who had been associated with him at some period of his seventy-three years of life.

**W. Paterson.**—We regret to learn of the death of Mr. W. Paterson, who passed away on April 5. He had been gardener to the Earl of Lanesborough, Swithland Hall, Loughborough, for the past twenty years. Mr. Paterson commenced his gardening career as an apprentice in the gardens at Terraughtie, Kirkcudbrightshire, and gained further experience at Eden Hall, Cumberland; Lazonby Hall and Castlesteads, Brampton, Carlisle; and afterwards was general foreman at Kidbrooke Park, Sussex. His first position as head gardener was with Mr. Jos. Pease (now Lord Gainford), Nunthorpe Hall, Middlesbrough. Mr. Paterson was a very successful exhibitor in the Midlands, and his services as a judge were in great demand. He is survived by a widow, two daughters and four sons; three of the latter are following their late father in the gardening profession.

**Professor C. S. Sargent.**—Professor Charles Sprague Sargent (see pp. 257 and 259) had long since passed the human expectation of life,

for he died on the eve of his eighty-third birthday: none the less, his death, which was barely noticed in the American daily press, found his friends here unprepared. To Sargent arboriculture and the Arnold Arboretum were the *Alpha* and *Omega* of his life. He assisted at the birth of the Arboretum, nursed it through the early stages, saw his child grow to adolescence and before his death had shaped its destiny in what none can doubt was the right direction. Sargent was in the singularly happy position of being able to gratify the ruling interest of his life—the study of trees, but the gratification of it has brought nothing but good to the cause of arboriculture and its practical application, not only to forestry work, but to all tree planters who care to profit by it. In the main, the old saw that men plant trees for their successors, not for themselves, is true enough, but at Boston Sargent was fortunately spared to watch the development of the work he initiated fifty-three years ago, and guided so ably since. Half-a-century may be nothing in the life of some giants of the forest, but there is a host of evergreen and deciduous trees and shrubs which show their quality long before that period has elapsed, and these have grown up under Sargent's hand. It is not generally known that it was Sargent's initiative that horticulture owes what may be termed the practical as distinct from the purely botanical side of the exploration of the Western Chinese flora, of which Delavay was the greatest exponent. It is true that in a sense the two are inseparable, but up to the closing years of last century botany had benefited far more than horticulture or arboriculture from Chinese exploration. In the preface to the first volume of *Plantae Wilsonianae*, Sargent has recorded that in 1897 he advised the then head of the firm of Messrs. J. Veitch and Sons to send a collector to Hupeh to collect the seeds of Augustine Henry's discoveries, and make additional observations on the flora of the region. In the result, Mr. E. H. Wilson was chosen to carry out Sargent's suggestion, and two years later began the series of journeys which have proved so fruitful for arboriculture, horticulture and botanical science. There must be many who recall a feeling of disappointment that after Wilson's initial journeys for Veitch, it was learned that the explorer's services were to be lost to this country, as he had accepted a commission to undertake further exploration in Western China for the Arnold Arboretum. But any initial sense of disappointment was soon set at rest, for science knows no boundaries, and Sargent took care that the world should share in the many brilliant discoveries Wilson made in the two expeditions undertaken on Sargent's initiative in 1906-1909 and 1910-1911. That, however, was not the end of it, for under Sargent's editorship the record of the arboricultural side of the collection was set down with remarkable celerity in *Plantae Wilsonianae*. The cultivation of Chinese trees and shrubs, too, in the, to us, rigorous climatic conditions prevailing in Massachusetts, has been of infinite practical value to growers in general. In the pursuit of his hobby, Sargent travelled far and wide, and though exotic flora had as great an attraction for him as it has for naturalists in general, he realised the extent and richness of the tree resources of his own country, spent five years in a systematic survey of it, and gave the result to the world in *The Silva of North America*. Sargent, who came of old Gloucestershire stock, had many friends in this country, and though he was not often able to visit England, always showed keen interest in the welfare of the many plants his characteristic generosity led him to send here. He was a foreign Fellow of the Linnean Society.

## TRADE NOTE.

READERS requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

## ANSWERS TO CORRESPONDENTS.

**CARNATION LEAVES DISEASED.**—C. G. The leaves of your Carnations are not attacked by Leaf-rot (*Pseudodiscosia*), but by the disease known as "Fairy Ring of Carnations," caused by the fungus *Heterosporium echinulatum*. In watering the plants, be careful not to wet the foliage.

**CHINESE CABBAGE.**—*Sharpthorne*. This vegetable should be grown much in the same way as Cos Lettuce. The seeds should be sown now in drills made eighteen inches apart, and the seedlings thinned to fifteen inches apart in the rows. There are several varieties, but all require very similar treatment. Grow the crop for preference on a south border in soil that has not been freshly manured.

**HIPPEASTRUM (AMARYLLIS) BULBS.**—W. S. One or two of the scale leaves inside the bulbs were slightly decayed. You do not indicate exactly what trouble you are experiencing with your plants; the two bulbs received appear to be normal. We shall be glad to examine further specimens if you care to send them.

**LAUREL HEDGE.**—J. B. The hedge should be pruned at once. Cut the growths hard back, using a sharp pruning knife or a pair of secateurs, and prune the hedge again during August or September. Garden shears should not be used in pruning a Laurel hedge, as many of the leaves would be cut in half and the appearance be unsightly.

**MELON SEEDLINGS FAILING.**—H. H. The Melon seedlings are attacked by a fungus, *Fusarium* species. This fungus exists as an infection in some soils and must have been present in the compost used for raising the seedlings, unless the water supply is taken from a pond or stream, in which case it might be contaminated. In future, you should raise your seedlings in soil sterilised either by heat or by formaldehyde. It should be an easy matter to improvise a simple baking apparatus, and arrange for the soil to be heated to a temperature of 206°F. for two or three hours. If you select the formaldehyde treatment the soil should be saturated with a two per cent. solution of this compound (one part forty per cent. formaldehyde in forty-nine parts of water). The saturated soil should be covered with sacks for forty-eight hours and then spread out to dry on a clean surface under cover. When the soil ceases to smell of formaldehyde it is safe to use.

**NAMES OF PLANTS.**—C. F. *Anemone coronaria*. A. E. J. *Peoralea pinnata*. A. E. F. 1, *Dimorphotheca* species; send better specimens; 2, *Allium neapolitanum*; 3, *Kleinia articulata*; 4, *Aloe arborescens* variety.

**VEGETABLES FOR A FAMILY OF SEVEN.**—*Digger*. On an average, a rood of ground is required to produce a supply of vegetables for four persons; therefore, in your case about two roods would be necessary. Much, however, will depend on the situation of the garden, the nature of the soil, and the attention and skill of the cultivator. What may be termed luxury crops will require more ground and greater attention than the commoner vegetables. Intensive cultivation, inter-cropping, and a well-considered scheme of rotation will give a greater bulk of produce than ordinary methods.

**VIOLET LEAF BLOTCH.**—A. M. The Violet leaves are suffering from an attack of *Ascochyta violae*, generally known as Violet Leaf Blotch. An excess of moisture, both at the roots and in the surrounding atmosphere, favours the disease, and it is always desirable to remove affected foliage directly the disease is noticed, otherwise the trouble will spread rapidly; indeed, the spores may be distributed readily by watering and syringing the plants. A light sprinkling of lime and sulphur on affected leaves will help to arrest the disease.

**Communications Received.**—H. S.—J. F.—W. H. D.—M. W.—K. W.—H. E. D.—W. A.—C. B. W.—C. N.—M. E. M.—G. H. D.—H. M.—G. B. A. M. J. K.—M. W.—W. F. S.—F. R. D.—C. F. C.

REMARKS.—Supplies were sufficient to meet all requirements during Easter week. With the exception of Richardias (Arums) and best Emperor Daffodils, prices showed very little change from those of the previous week. Carnations, Roses and Lillium longiflorum were all in first-class condition and prices for these flowers were exceptionally low for the Easter trade. Gladioli are the newest subjects in this department; Blushing Bride and Peach Blossom are the varieties at present to hand.

REMARKS.—A satisfactory volume of business has been transacted during the past week, and no doubt the fine weather contributed to this. Peaches, Pears, Plums and Grapes from South Africa continue a popular section of the trade. The fruits, generally, are in good condition and sell well. Australian and New Zealand Apples are available in good condition and they are realising prices that will doubtless prove satisfactory to the growers. The North American Apple season has not entirely finished, a few fruits being still available from the United States and Nova Scotia. Hothouse Grapes from Belgium are in demand, and a few Grapes are arriving from the Worthing district. Forced Strawberries are a fairly good trade, although still very expensive. Grapes from Australia are useful and sell moderately well. Asparagus is arriving from France in greater quantities and, unfortunately for the English Asparagus grower, the large consignments from France are coinciding with his earliest cuttings. Forced Beans, Peas and new Potatoes are all cheaper, the cheapness of Asparagus and the usual congestion of produce over the holiday being the main cause of lower prices. Mushrooms are a variable business; their prices fluctuate with the quantities marketed daily, but by the end of the week trade in Mushrooms will have become more stable. New Potatoes from Spain the Azores, Canary Islands and Guernsey are a moderate trade. Salads are selling fairly well. Green vegetables are not a particularly keen business. Trade in old Potatoes is steady at prices round about the same as last week for tubers of best grades.

## GLASGOW.

Daffodils continued to be a weak feature of the cut flower market during the past week when large daily deliveries were chiefly responsible for the cheap prices. Sir Watkin was worth from 1/- to 1¼ per dozen bunches; ornatus, 1/- to 1½; Emperor, 1/3 to 1/9; Victoria, 1/6 to 1/-; and King Alfred, 2/6 to 3/6. Tulips, on the contrary, were not so plentiful, as growers are nearing the end of the season and values were therefore influenced in an upward direction. Prices for Murillo ranged from 7d. to 9d. (6's); Bartzon, 7d. to 11d.; Haarlem, 8d. to 10d.; Prince of Austria, William Copland, Lucetia and Lulsante, 10d. to 1/-; Madame Krelage, 9d. to 1/-; Clara Butt, 4d. to 8d.; and Farncombe Saunders, 1/2 to 1/6 per dozen. Blue Irises were 6d. to 1/- cheaper at 2/- to 4/- per dozen, while the value of yellow varieties remained steady at 1/6 to 2/6. Lillium longiflorum (Harrisii) realised from 4/- to 5/6 per bunch; Richardias, 4/- to 7/-; Lilac, 1/- to 1/6; Lily-of-the-Valley, 2/- to 2/6; Hyacinths, 6d. to 9d.; Carnations, 3/- to 4/- per dozen; pink Roses, 3/6 to 5/-; red Roses, 2/- to 4/-; Anemones, 1/- to 1/6; and Wallflowers, 1/- to 1/6.

Bedding plants were offered in increasing quantities, but at this early season there was no demand, and prices of Dahlias, Asters, Stocks, Lobelia, Gladioli, Antirrhinums, Daisies and Marigolds were normal at 1/6 to 2/- per box.

Business in the fruit market was again quiet, but the tone, generally, was steady. Oranges and Apples were quoted unchanged, but Cape Grapes realised 7/- per box after the price had been 5/-. The value of Porto Rico Grape Fruit fluctuated between 20/- and 25/- per case.

In the vegetable section Cauliflowers averaged 3/6 per dozen; English Cucumbers, 6/- to 7/- per dozen; Dutch Lettuces, 30's, 3/- to 3/6; 24's, 2/6 to 3/-; French Beans, 5/6 per box; Guernsey Beans, 1/6 per lb.; Peas, 12/- per hamper; Radishes, 2/-; Endive, 2/6; Tomatoes were scarce at 28/- to 32/- per bundle, and field Rhubarb sold for 10/- to 12/- per cwt.

## GARDENING APPOINTMENTS.

Mr. Rowland Brown, for the past three years foreman at Englefield Gardens, Reading, Berkshire, as gardener to J. P. MARLING, Esq., Glat Rissington Manor, Bourton-on-the-Water, Gloucestershire. (Thanks for 2/6 for R.G.O.F. Box.—EDS.)

Mr. J. Smith, for the past six years gardener to C. E. DE TRAFFORD, Esq., Hothorpe, Theddington, Rugby, as gardener to the Rev. MOTTER, at Poles, Ware, Hertfordshire.

Printed copies of the full Published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at the uniform price of 1s. each.

## Abstract Published.

A recent improvement in motor-driven lawn mowers enables one to cut the grass in awkward places without having to hold the machine in check when going backwards and forwards over the ground. The idea is to have a clutch arrangement which enables the ground rollers to be disconnected at will by just touching a lever. By doing this the rollers are prevented from exerting their pushing force, so that one is free to use the machine just as if it were one without an engine at all, although the cutters are working all the time. The idea is that of Messrs. E. M. Smith, of Sigers, Eastcote, Middlesex; H. N. Death, of Manor Lodge, Salford, Somerset; and the Tangent Tool Engineering Co., Ltd., Tangent Works, Keynsham, near Bristol.

## THE LATEST TRADE MARKS.

This list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

## DARFEN.

A.**, Box 69, 5, Tavistock Street, Covent Garden, W.C.2.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.*

### PRIVATE.

**HEAD GARDENER** seeks engagement where several are employed; thoroughly experienced all branches; married, no family, highest references.—**LAWRENCE**, The Gardens, Farrington House, Exeter.

## FOWLER'S LAWN SAND AND FERTILIZER

*The Originator of Lawn Sands*

Destroys all obnoxious weeds, moss and discolours the grass  
least of any. Produces a rich velvety green. 60 years'  
experience in lawn culture.

THE OLDEST AND STILL BY FAR THE BEST  
ON THE MARKET.

If required for destroying weeds only, a pinch in the  
centre of each weed will entirely clear your lawn.

In tins, 1/6, 3/- and 5/6; 1/2 cwt. 8/-; 1/2 cwt. 14/6;  
1 cwt. 25/-; in strong airtight kegs.

*Of all Nurserymen and Seedsmen*

CORRY & Co., Ltd., Shad Thames, London, S.E. 1

## NICOTINE INSECTICIDES

Are by far the most efficient and eco-  
nomical for destroying sucking insects in  
Greenhouse, Orchard, or Garden. I pack in  
pure Nicotine 95-98%, Nico-Soap (Nicotine  
and Soft Soap) and Fumigating forms.

**CAMPBELL'S**  
**PATENT SULPHUR VAPORISER**  
For vaporising Sulphur. The best method  
of destroying Mildew on Roses, Vines, etc.,  
in Glasshouses.

Have been building Greenhouses from 1841 to  
1927, a record of 86 years of sound construction.

**GOOD Greenhouses last—others do not.**

**The ROBIN HOOD BOILER**  
reduces the fuel bill and saves labour.

*Estimates on application Free.*

## A Garden in the Spring

Let one's spring-time thoughts turn to the development  
of the garden. There is no better aid to a garden than  
a Glass House. Not *any* Glass House, but a Glass  
House built to last, carefully and accurately designed to  
withstand any sort of weather. Such Glass Houses William  
Duncan Tucker & Sons Ltd. construct—*have* constructed  
since 1830. Their value is indisputable. Flowers, plants,  
fruit—grow them all. A Duncan Tucker Glass House is  
not unduly cheap, its makers have never tried to pretend it  
was. But its wonderful value makes every owner grateful  
to possess one. For repair work, also, William Duncan  
Tucker & Sons Ltd. can be of inestimable use to the wise  
Glass House enthusiast.

## WILLIS BROS.' Garden Fertiliser

THE BEST ON THE MARKET.

**NO STABLE MANURE REQUIRED.**

For digging in or as a top-dressing. For kitchen  
Gardens or Herbaceous Borders.

1 cwt., 15/-; ½-cwt., 9/-; 28 lb. 5/-; £14 10/- per  
ton. All Carriage Paid.

### LOOK TO YOUR VINES!

The Vine requires a large quantity of Potash for its  
proper growth and the development of fruit. WILLIS  
BROS. VINE MANURE contains 7% Potash, 22%  
Phosphate, and 4% Nitrogen, and the results justify us  
in saying it is the best on the market. The effect on  
old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56 lb. 14/- 28 lb. 8/- All Carriage Paid

### LAWN MANURE.

Having been connected with the experimental  
manuring of pastures, etc., for over 40 years, we are  
in the position to offer the above with perfect  
confidence as to results. It is especially suitable for  
poor mossy lawns, improving the texture of the grass,  
and helping the lawns to keep their colour in dry seasons.  
Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage  
Paid. Special Prices quoted for Grass Manures for  
Park Land in quantities.

### LAWN SAND AND DAISY KILLER.

This preparation will be found very effective for  
thickening the sward and encouraging the grasses; also  
destroys the daisies and other weeds so troublesome  
on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.  
DIRECTIONS FOR USE.—Sprinkle thinly over the surface  
of the lawns at the rate of 4 to 6 ozs. to the square yard;  
where a mass of weeds occurs a little more may be used,  
as the grass cannot get through until the weeds are  
killed. A dry day in autumn or spring is the best time  
to apply the LAWN SAND.

### SUSSEX TRUG BASKETS.

18" 4/-; 20" 5/-; 22" 6/-; 24" 7/-; 26" 8/-; each.  
Carriage Paid.

### GARDEN SUPPLIES AT LOWEST PRICES.

Write for our List of Garden Manures and Horticultural  
Sundries. Free on application.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, April 27, 10 a.m. Bar. 30.2. Temp. 49°. Weather, Cloudy.

On "Ringing" Fruit Trees. THE practice of ringing branches of fruit trees in order to induce fruit-bud formation and the development of large fruits is one of ancient date. In the hands of skilled operators it has often led to beneficial results, though why it should do so is, at best, a matter of conjecture. The subject of "ringing" has been investigated\* recently at the Research Station, Long Ashton, by Mr. Swarbrick, with results which are of interest both to fruit growers and to students of plant-physiology. The conclusion of most practical importance reached by the author is that, as in so many other garden operations, timing is the essence of the contract. If the ring of cortex and bast be removed too early, for example, before the time at which the buds begin to break, the result in the case of two-year-old shoots of Apples are apt to be disastrous; before

the year is out branches above the ring die and break off. If, on the other hand, a ring of cortex and bast be removed too late in the year, no flower bud formation is induced in the ringed branch, and the vegetative buds of the branch delay their breaking for at least a fortnight after the time when the buds on untouched branches have burst. But if ringing be done in early June, the effects as revealed next spring are remarkable. Fruit-bud formation has been induced above the ring, and the fruit-buds on the ringed branch open out their flower trusses a fortnight before other fruit-buds on unringed branches begin to break. Therefore, if the object of ringing be to induce fertility, the operation must be properly timed. Fruit bud formation in the Apple is known to occur normally during late June and early July. What the plant does in that part of the year determines apparently the supply of blossom in the following spring; ringing, therefore, must be done so late as possible, but early enough to catch the tree in the fruit-bud forming mood. It must not, however, be left too late, for otherwise the laborious operation of wound healing is not completed before growth ceases in the autumn. Branches ringed late do not heal completely within the year. Therefore, those—and there are many—who own trees which are reluctant to form fruit buds, and who would like to try the effect of ringing, should time the operation for about the end of the first week in June. A narrow ring, say, of half-an-inch, or a little more, appears to be better than a wider one, for evidently the healing operation necessary to rejoin the severed tissues will then be of lesser magnitude. Some practice a knife-edge ring—that is, a circular incision down to the wood. This, however, does not appear to be drastic enough; the wood heals too quickly. From observations made by Mr. Swarbrick, it appears that callusing of the wound is greatly favoured if the ring is covered by surgical tape. When this simple dressing is provided, callus starts at both upper and lower edges of the wound. A mass of dividing cells grows out from the phloem. These cells produce phellogen by the division of whose cells a mass of wound callus is formed which spreads over the cut surface and restores continuity between the upper and lower edges of the ring. Those who undertake the operation require to exercise care lest the cut goes too deep. It should leave the wood intact or as nearly as may be intact; for otherwise the ringed branch may be destroyed. A little practice, however, will soon give the necessary precision, and those who are skilled in the art of budding and grafting will have no difficulty in ringing branches. It would be well, however, to begin, not on the trees that are whole, but on those which are persistently unfruitful or only meagre producers. Moreover, it is to be remembered that Mr. Swarbrick's experiments were done on two-year-old branches of Apple. Whether the operation would be so successful if performed on, say, the eight- to ten-year-old main stems of cordon Pears—a whole regiment of which we have in mind as an unfruitful set—is, perhaps, doubtful. It would be particularly interesting to ascertain whether ringing may not be the means of inducing fruitfulness in Pears which, grown as cordons, are undoubtedly on stocks too vigorous for fruitfulness. Root-pruning in such cases is doubtful and laborious, and if ringing were to induce fruitfulness there are many fruit gardens which would greatly profit thereby. Science is creeping up to practice and we are glad to see that the research workers in pomology keep a keen eye on

the practical side, whilst not neglecting the purely scientific. These ringing experiments throw interesting light on the way in which plants mobilise their food materials, passing them from the leaves to all other parts. We believe that presently something like a true picture of the movement of the food material throughout the plant will be arrived at, and then much that is dark and doubtful in the physiology of plants will become clear and certain—to the benefit both of scientific and practical horticulture.

**Award of the Linnean and Crisp Medals.**—At the meeting of the Linnean Society, on the 7th inst., the President, Dr. A. B. Rendle, announced that the Linnean Medal had been awarded to Dr. Otto Stapf, Ph.D., F.R.S., and the Crisp Award and Medal to Professor Herbert Graham Cannon, M.A., D.Sc.

**Horticultural Club.**—Following a dinner of the Horticultural Club at the Trocadero Restaurant, Piccadilly Circus, on May 10, Mr. E. A. Bowles will deliver a lecture illustrated by lantern slides, entitled, "Botany, History and Philology of the Cabbage." Non-members may obtain tickets for the dinner and lecture, price 10s. 6d. each, from the Hon. Secretary, Mr. G. F. Tinley, 855, London Road, Westcliff-on-Sea, Essex.

**Creosoting Posts.**—In a letter by Mr. G. F. T. Leather, in the *Quarterly Journal of Forestry*, for April, the writer states that wood should never be creosoted with the bark on, as bark is very absorbent. Mr. Leather does not consider it necessary to creosote either Ash or Elm posts, if they have to be put into the ground, as though they do not actually rot, they become very brittle and snap off like Carrots. Birch, Mr. Leather considers, is much improved by the treatment, and whereas untreated Birch posts last only about two years, a creosoted one appears to last as long as Larch. Mr. Leather advises all those erecting permanent fences to treat the posts with either creosote or some other preservative. Gardeners should remember that creosote is very injurious to plant life, and that it is not advisable to plant Roses or any other subjects close to posts that have been newly creosoted.

**A Horticulturist in Algiers.**—Mr. J. Cheal, of Messrs. J. Cheal and Sons, Crawley, who is on a visit to Algiers, sends us greetings from the desert and gives an interesting account of some of the things he has seen. He states that on landing at Algiers and when motoring over one hundred miles through the country to the east and south, he was most impressed with the fertility and high state of cultivation of the land; the ground is mostly undulating with very few trees. The district includes many thousands of acres of vineyards all in a high state of cultivation, the tillage being done by hand, horses, mules, camels, and in some cases with Fordson tractors. He states that motor-sprayers are used for the suppression of diseases, the chief insecticide employed being Bordeaux mixture. He saw many men and women engaged in thinning and tying up the young growths of the vines. A little corn is grown, chiefly Barley and Oats, also Beans, Peas and many Potatoes. In some of the sheltered places the early crop of Potatoes was already lifted, but in the open fields planting of the late varieties was still being done by women and children. One crop that he saw from a distance rather puzzled him, and on close inspection he found it to be an Ivy-leaved Pelargonium, the foliage of which was very dense and covered with pale pink flowers. The leaves are very strongly scented, causing the air to be heavy with perfume, and Mr. Cheal concluded that the crop was grown for producing scent. He states that this particular crop extended to several thousand acres. He saw plantations of Oranges and Loquats, the former with rather small fruits, but of very good quality; the latter were not nearly so large and good as those grown in Egypt. Phunis, Olives, Figs and a few Apricots

\* The Healing of Wounds in Woody Stems. II. Contribution to the Physiological Anatomy of Ringed Apple Shoots. By Thomas Swarbrick, *Journal of Pomology*, VI., February 1, 1927.

are also cultivated, but he saw no Apples or Pears. Tomatoes are grown extensively in market gardens near towns. The plants are protected by shelters made with Bamboo rods and leaves placed closely together sloping towards the south, and on these the Tomato plants are trained. He states that there is an air of prosperity everywhere, and Algiers must be an exceedingly valuable colony to France in many ways. Further inland, Esparto grass is grown to supply pulp for paper-making. He saw many large stacks of the grass and many railway trucks laden with bales of it ready for transport to the ports, most of it being shipped to this country.

**Weeds.**—In reply to a question by Mr. Spoor as to the number of cases of action taken by County Agricultural Committees to enforce the regulations for destroying weeds under the provisions of the Corn Production Acts (Repeal) Act of 1921, the Minister of Agriculture in the House of Commons recently gave the following interesting particulars:—

	1922	1923	1924	1925	Total 1922-1925.
Cases reported to Agricultural Committee ...	241	936	1481	1451	4109
Cases dealt with by arrangement ...	187	917	1426	1321	3851
Notices served ...	82	91	104	190	467
Successful prosecutions ...	1	6	9	14	30
Unsuccessful prosecutions ...	—	3	—	1	4

**Blue Primroses.**—From Mr. W. J. Stables, Gardener to Clive Cookson, Esq., we have received a selection of blue and other Primroses raised at Nether Warden, Hexham, where Orchids are not the only interesting plants grown. The original cross was between a blue Primrose and *Primula Purple Splendens*; and the results, together with seedlings of the second generation, are very beautiful, the blue colour ranging from light mauve-blue to intense violet-blue. Most of the flowers are of fine size and have an orange centre; others produce their flowers in bunches, after the style of *Polyanthuses*, but on shorter peduncles. A few varieties are of rich crimson colour, and these are as beautiful in their way as the blue forms, but the latter are the most interesting and indicate the great possibilities that lie in careful crossing and selection.

**Luminous Plants.**—At the meeting of the Linnean Society on April 7, Mr. J. Ramsbottom referred to the phenomenon of luminescence. Amongst plants, bacteria, fungi and Peridineae, all non-chlorophyllous, are well-known as showing examples. Luminous bacteria commonly occur on putrefying fish, meat and such like, and about thirty species have been described. *Pierantoni* and *Buchner* have been led to a belief in bacteria being the source of light in various animals by the study of the symbiotic yeasts—e.g., in the larvae of Aphids. Amongst fungi the phenomenon is seen in many species of *Pleurotus*, both sporophore and mycelium usually being luminous. None of these species has been recorded for this country. Luminous wood is common, but it is due to the mycelium and young rhizomorphs of *Armillaria mellea*. It is of interest to note that there is sometimes unanimity about the luminosity of a given fungus, e.g., *Armillaria mellea* and the American Jack o' Lantern (*Clitocybe olearia*—*C. illudens*). At other times there are conflicting statements, e.g., about *Xylaria hypoxylon* and *Panus stipticus*. Buller has recently shown that the American forms of *P. stipticus* are luminous, whereas those of Europe are non-luminous. Another point of interest is that decaying leaves on the ground in woods frequently emit light, presumably on account of the presence of fungal hyphae.

**Syringa Lamartine.**—This hybrid Lilac, which received an Award of Merit when exhibited at the fortnightly show of the Royal Horticultural Society on Tuesday last (see p. 309), by the Director, Royal Botanic Gardens, Kew, is the result of a cross between the early-flowering Chinese species, *Syringa Giraldui*, and an early-flowering variety of the garden Lilac (*Syringa vulgaris*), raised by M. M. Victor Lemoine and

Sons, Nancy, France. This new Lilac is a vigorous-growing variety, forming a tall, upright growing bush, flowering during the second half of April, which is a week or two before the earlier named varieties of Lilac make much display in our gardens. The single blossoms are an inch across, borne in large panicles of pleasing fragrant, mauve-pink flowers. *Syringa Lamartine* and several other varieties of similar origin were introduced just previous to the outbreak of war, in 1914. *Lamartine* has been in cultivation at Kew since 1912, but recent inquiry of M. Lemoine indicates that there was very little demand for the plants, and some appear to have been lost. Those which still survive and have been recently planted at Kew include *S. Berryer*, semi-double, mauve; *Buffon*, single, mauve-pink; *Claud Bernard*, semi-double, lilac-mauve; and *Mirabeau*, single, mauve.

**Tulips in the Royal Parks.**—Sir Daniel Hall has compiled the following short history of the Tulip for His Majesty's Office of Works, for

THE LATE MR. GEORGE MOUNT, V.M.H.  
(see p. 311).

display in the Royal Parks and Gardens during the time when the bulbs are in flower:—"The garden Tulip was brought to western gardens from Turkey about the middle of the sixteenth century. Its origin was still further eastward, for manuscripts two centuries earlier describe in the gardens of Baghdad Tulips possessing all the special characteristics that distinguish the race to-day, but from what species, one or many, the garden Tulip arose we are still uncertain. From its earliest introduction it became a much-prized flower, not only in England and Holland, but also in Flanders, France and Germany, wherever gardens flourished. New varieties were raised from seed; in 1629, Parkinson enumerates over a hundred. Fanciers made a cult of the flower and defined the characters to be aimed at in breeding. About 1630, the interest in Tulips grew to such a pitch in Holland that the speculators stepped in and made gambling counters of the new varieties which were sold by auction at amazing prices to all sorts of people who had not the least intention of growing them. After this mania the Tulip still remained a florist flower and was continually improved throughout the eighteenth century, chiefly by the Dutch growers. The English fanciers then took up the work, and early in the nineteenth century the working-man florists in and around London and all of the towns of the north and midlands, bred the Tulip to new standards of excellence. With the growth of the towns, the old florist societies and their shows are almost extinct, but it is to their work that we owe many of the flowers adorning the

garden to-day. Though all the garden Tulips belong to one common race, they can be divided into certain well-marked groups. First of all, come the early Tulips, which bloom in the open about London towards the middle of April. They are dwarf in habit and are mostly self-coloured yellows, pink and purples, and whites. About three weeks later the stronger-growing May-flowering Tulips are in bloom. The oldest group, the Dutch, embraces flowers usually of medium height with cup- or egg-shaped blooms in colour brown (bizarres), rose or purple (bybloemen). The English Tulips are very similar, but the flowers are more brilliant in colour and open into a more perfect cup. The Darwin Tulips are a stronger strain of more recent introduction, taller and more vigorous in growth, with massive, square-shouldered blooms that stand up well to the rain and wind in the open garden. Cottage Tulips form a very varied group, often with long, pointed and recurved petals. They include the pure yellow flowers and others of mixed shades where pink and purple is shot with yellow. All garden Tulips exhibit one peculiarity. New varieties arise only from seed, and the seedlings always come self-coloured—pink or purple, or brown, i.e., some shade of crimson on either a white or a yellow ground. The original seedling bulb then increases from offsets and may give rise to millions of bulbs, all of which are exactly alike. But from time to time, amongst these "breeders" sports occur in which the original self-colour is drawn up into streaks and stripes on a white or yellow ground. These "broken" Tulips produce increases like themselves and never go back to the self-coloured forms. Thus, there are streaked Tulips belonging to the Dutch, English, Darwin and Cottage groups, and it is the English broken Tulips that are most prized by the fancier. A few Tulip species are grown: *T. Greigii*, with spotted leaves, the early *T. Kaufmanniana*, *T. praestans*, and *T. Fosteriana* are brilliant but uncertain in many gardens; *T. sylvestris*, a small, nodding, sweet-scented Tulip, is doubtfully wild in some English localities, but was probably brought here by the Romans. May-flowering Tulips are among the easiest and most gratifying of bulbs to grow, but to make the best of them they should be planted deep; six inches below the surface and lifted every year when the leaves begin to yellow."

**Legacy to a Gardener.**—The late Mr. Henry Swain, a member of the firm of Freeman, Hardy and Willis, who left £149,941, bequeathed £100 to his gardener.

**The Weather One Hundred Years Ago.**—In view of the very cold weather of the past week or so and the heavy falls of snow in some parts of Scotland and northern England, the following paragraph extracted from the *Times* of Friday, April 27, 1827, shows that severe cold with much snow caused gardeners as much anxiety then as the present severe weather is giving them now:—"The weather has again assumed the aspect of winter. Yesterday morning a snowstorm commenced and continued, without intermission, throughout the day. The adjacent country was covered with snow to a depth of several inches, and the trees and bushes, which, within the last fortnight, have burst into leaf, presented the unusual appearance of their green and tender foliage shrouded in the ungenial drapery of winter. Towards evening the storm increased to a tempest. Gardeners must view this extraordinary change in the atmosphere with dismay.—*Edinburgh Observer*. A heavy fall of snow occurred in this neighbourhood early yesterday morning. The Blagdon Hills were covered to a depth of half-a-foot in a few hours.—*Taunton Courier*."

**Crop Prospects in the Vale of Evesham.**—A correspondent informed us that the warm weather during the Easter holiday and since has resulted in rapid development of plant growth in the Vale of Evesham, and the first cutting of *Asparagus* of any commercial significance was made last week. The *Asparagus* season promises to be one of the best, so far as quality and yield is concerned, during recent years. *Asparagus* was first introduced to Badsey, which is regarded as the centre of the industry in the midlands, so far back as 1860.

and it is estimated that within a five-mile radius of Evesham there are over five hundred acres of Asparagus. Up to the present, the prospects are favourable for a good yield of fruits. Plum blossom, which provided a glorious site for holiday-makers at Easter, is fast vanishing, and in a few days the countryside will wear a mantle of green. Such spring flowers as Narcissi, Wallflowers and Daffodils have realised good prices. Hardly any Wallflowers have sold for less than sixpence per dozen bunches, while Narcissi and Daffodils have made about two shillings per dozen, while Primroses, Canterbury Bells, Polyanthuses, Violets, Anemones and Forget-me-Nots have all made good prices in the Pershore (Worcestershire) markets.

**Potash from the Dead Sea.**—The Colonial Office and the Government of Palestine are prepared to grant a concession for the working of the deposits of salts, which are rich in potash, in the Dead Sea. It is estimated that the total quantity of potash in these deposits is 2,000,000,000 metric tons, and that there should be no difficulty in extracting 100,000 tons of potash annually from the sun-evaporated brine of the Dead Sea. In order to develop the scheme, a power station for pumping and machinery will have to be erected and a new railway built from Jerusalem, a distance of eighteen miles, or, alternatively, a pipe-line or transport by road will be organised.

**Professor of Horticulture appointed Sales Manager.**—Professor Arno H. Nehrling, of the Department of Floriculture and Ornamental Horticulture at the New York State College of Agriculture, is joining the Hill Floral Products Co., of Richmond, Indiana, as sales manager. Professor Nehrling, after winning a competitive scholarship at the Shaw School of Botany, St. Louis, was placed in charge of the school garden work in Chicago, and subsequently became assistant in floriculture at the University of Illinois. This is not Professor Nehrling's first venture into business for, after being appointed head of the department of floriculture at the Massachusetts Agricultural College, he entered the florists' business as president and manager of Messrs. McDonald and Co., a wholesale and retail firm at Crawfordsville, Indiana. This appointment, however, he relinquished after four years and joined the staff of the New York State College as Professor of Horticulture.

**To Prevent Damping Off.**—A correspondent, writing in *Horticulture, U.S.A.*, states that the use of granulated peat moss largely prevents seedlings from damping off. He states that he finds granulated peat very effective in preventing damping off in Rose seedlings. The peat absorbs large quantities of moisture without becoming waterlogged and is always well aerated. In addition it is bacteriologically sterile and inhibits the development of fungi and other foreign growth in the seed-pan.

**Klosterneuburger (Austria) Horticultural College.**—We learn from an Austrian contemporary that Dr. Ludwig Linsbauer, for many years Professor and since 1922 Director of the Horticultural College at Klosterneuburg, has retired, and has been succeeded by Dr. Arthur Bretschneider.

**Appointments for the Ensuing Week.**—SUNDAY, MAY 1: Wakefield and North of England Tulip Society's meeting. MONDAY, MAY 2: Romsey Gardeners' Association's outing. TUESDAY, MAY 3: Rhododendron Society's show (two days); Royal Caledonian Horticultural Society's meeting. WEDNESDAY, MAY 4: Nottingham and Notts. Chrysanthemum Society's meeting. THURSDAY, MAY 5: Manchester and North of England Orchid Society's meeting. FRIDAY, MAY 6: Accrington and District Chrysanthemum Society's meeting; Orchid Club meeting. SATURDAY, MAY 7: British Mycological Society's Spring Foray at Wisley, for London students; Blackburn and District Horticultural Society's meeting.

**"Gardener's Chronicle" Seventy-five Years Ago.**—*The Auricula.*—As Auriculas are still in flower, and as we have been asked "What

constitutes a perfect Auricula in the estimation of a florist?" we gladly respond to the question by laying down the principal rules by which we are guided when examining this favourite florist flower. In its general appearance the foliage should be well grown and healthy, covering a space about equal to double the width of the head of bloom. The stem should be firm, erect, and sufficiently strong to support the truss without assistance, and to carry it well above the foliage. The footstalks of the pips should be strong and of such a length as will allow the flowers to open without one overlaying another, the whole forming a compact and globular head of well-expanded flowers, equal in size and similar in properties. The addition of

or outer edge, must be of a permanent green, white, or grey colour. The circles which compose the face of the pip are considered of the finest proportion when they are of a uniform width; that of each circle being half the diameter of the tube. These properties are considered by florists to form the standard of perfection in the Auricula. The number of pips necessary to form a head for competition varies in different localities. In the north they are exhibited with from three to nine; about London seven are considered requisite. Not less than five, however, ought to be allowed (except, perhaps, in seedlings of the first season), and as many more as can be symmetrically arranged, that have the required properties. Sells, or Auriculas with only one

FIG. 145.—ROSE CHARLES P. KILHAM.

Awarded the N.R.S. Gold Medal on April 22. (see p. 307)

one or two guard leaves, standing up at the back of the truss, gives a finish to the whole and adds considerably to its beauty, by the contrast they make with the vivid and lively appearance of the flowers. The qualities which the individual pip should possess consist in its being perfectly round, flat, and smooth on the edge; the division which form the segments of the corolla should be but very slightly indented, thereby rendering the circle as perfect as possible. The tube, or centre, must be round, of a yellow colour, filled with the anthers or "thrum." The eye or "paste" round the tube should form a perfect circle of a dense pure white, clean on its edges, even, and free from blemishes. The band of colour surrounding the eye should be dark, rich or bright, equally distributed all round; but never encroaching so much upon the edge as to pass through to the rim. The margin,

colour, besides the eye, are judged on the same principle, as regards form, colour, uniformity, and size; with this exception, that as in some sorts the eye is small, in comparison with the blue purple, or dark, a slight variation is required in regard to the proper distribution of colours, and the paste, or eye, ought to be one-half the width of the tube—larger in self-coloured Auriculas than in those which are edged. Alpines, or Auriculas with yellow centres and shaded margins, are judged by the same standard as above. They are not, however often grown. *Gard. Chron.*, May 1, 1852.

**Publications Received.**—*The Beginner's Garden*, by Mrs. Francis King; Chas. Scribner's Sons, 7, Beak Street, W.1: price 7/6 net.—*Catalogue of Scientific Books*, on sale by W. Heffer and Sons, Ltd., 4, Petty Cury, Cambridge.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Lycastes.**—The genus *Lycaste* comprises many plants especially useful to those who have to maintain a supply of choice flowers at all seasons. *L. Skinneri*, in its many varieties, together with *L. Lucusta*, *L. costata*, *L. cruenta*, *L. lasioglossa*, *L. macrophylla*, *L. Ballae*, *L. Imschootiana*, *L. Lucianii* and *L. Janetiae*, have been blooming for some considerable time, and directly they have passed out of flower is a suitable time to ascertain if any are in need of fresh rooting-material. Plants that have sufficient rooting-space and with compost in good condition should not be disturbed. Others that have become pot-bound, and those that are in a bad condition at the roots or are growing in decomposed material, should be taken out of the pots, the old material carefully removed, and repotted in fresh compost.

**Compost.**—The compost should be made of good fibrous loam, from which the earthy particles have been removed, peat fibre and A.I. fibre in equal parts, mixed with a small quantity of *Sphagnum*-moss.

**Watering.**—Keep the crown of the plant below the rim of the pot in order to provide ample space for watering when the plants are in full growth, as during their season of growth these Orchids require liberal supplies of moisture at the roots; even when they are at rest they should not be allowed to suffer for the want of water. The usual precautions as regards the application of water to newly-potted plants applies especially to these Orchids, as they have fleshy roots which soon decay if over watered. The pots should be well-drained to allow the surplus water to pass away freely.

**General Treatment.**—Those named and others which produce their flowers at different seasons will all succeed at the cooler end of the intermediate house, or at the warmer end of a cool house where the atmosphere is not close. The plants should be watched from time to time for attacks of red spider, which is liable to infest the undersides of the leaves when the plants are growing in a dry atmosphere. Dipping the plant in a mild insecticide may be recommended, and, during hot weather, spraying them under the leaves once or twice daily. These Orchids should be shaded from strong sunshine as their thin leaves soon become scorched if exposed to strong sunlight.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**New Zealand Spinach.**—This vegetable should be sown in rows made three feet apart in a sunny situation and, if possible, in light soil. The seedlings should be thinned finally to two feet apart.

**Beet.**—The main crop of Beets may now be sown in an open situation on well-pulverised, deeply dug, unmanured ground. A liberal dressing of burnt refuse strewn over the surface of the ground and afterwards well raked into it will be found very beneficial to the crop. The seeds should be sown very thinly in drills made about one-and-a-half inches deep, and fifteen inches apart. Both long and round varieties may be sown now, but on very shallow soils I advise sowing the round varieties only. Should long, shapely roots be required for exhibition, adopt the method advised by me in a previous calendar for growing exhibition Parsnips and Carrots.

**Salsify and Scorzonera.**—Seeds of these vegetables may be sown now on similar ground to that advised for Beets. A careful watch should be kept for mice, as they quickly destroy the seeds of these vegetables.

**Dwarf Beans.**—A small sowing of Dwarf Beans may be made on a warm, sheltered border. The soil should previously have been well prepared. Care must be taken so soon as the young plants show above the ground, to provide some protection for them on cold, frosty nights. Slugs are often troublesome to this crop in showery weather, but frequent light dustings with old soot will act as a deterrent to these pests. Seeds of dwarf and also Runner Beans sown earlier in boxes have germinated, and the seedlings should be given plenty of ventilation and hardened gradually in readiness for planting outside towards the end of May or early in June.

**Brussels Sprouts.**—If not already done, the site intended for this crop should be well trenched and manured, in readiness for setting out the plants. In the meantime the seedlings should be well hardened by exposing them fully to the weather, except on frosty nights.

**Dandelion and Chicory.**—Seeds of these salads should now be sown in rows made one foot apart. When sufficiently advanced, the young plants should be thinned to a distance of nine inches and twelve inches respectively.

**Ridge Cucumbers.**—Where there is a demand for ridge Cucumbers, the young plants should be raised in small pots, and well hardened preparatory to planting them out in a warm position on a raised bed towards the middle of June.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Hippeastrums.**—As these plants pass out of flower they should receive every encouragement to form stout bulbs, and to obtain this end the plants should be encouraged to produce strong, healthy foliage. Much will depend on the treatment extended to the plants during the next few months with regard to the flowers they will produce next season. They should be fed liberally with liquid manure and grown in a temperature ranging from 60° to 70°, but after the foliage is fully developed they may be transferred to a house having a lower temperature, and placed in a sunny position in order that the bulbs may become well-ripened. Continue to water the plants until such time as the condition of the foliage shows that a rest is needed.

**Grevillea robusta.**—Grevillias raised from seed that were sown during February as I advised are ready for placing singly in small pots. The compost should be of an open texture. Stand the young plants in a house having an intermediate temperature until they have become well established at the roots; later, they may be grown in cooler conditions. Treated in this way the plants will be able to withstand the various temperatures they will be subjected to when used for decorative purposes.

**Cuttings.**—Cuttings of various subjects that have been rooted for the decoration of the stove and greenhouse, such as *Codiaeums* (*Crotons*), *Dracenas*, *Saintpaulia* and *Bouvardias*, should be ready for transferring singly to small receptacles. Care should be taken not to break the young roots, which are very brittle. The soil for this potting will depend on the subject under treatment; for instance, *Codiaeum* (*Crotons*) and other stove plants need good fibrous loam and peat, while most of the greenhouse subjects require a mixture of good, open loam, leaf-mould and old Mushroom-bed manure, with a liberal quantity of coarse sand and broken charcoal added in both cases. After potting the plants, stand the various subjects in temperatures suitable to ensure free growth. Watering should be done very carefully until the young plants have become well established in the new compost. Most of these subjects will need shading slightly for a

short time, and they will be greatly benefited by spraying them lightly several times daily, but not to the extent that would cause the topsoil to become sour.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**The Orchard House.**—The earliest fruits of Peaches and Nectarines will be sufficiently advanced to call for variation in treatment; more fresh air should be admitted to the house, the syringing should be lighter, and less fire-heat used. The flavour of very early fruits is often spoiled by hard forcing, whereas, by opening the ventilators and using the minimum amount of fire-heat, their quality may be improved and their season prolonged. The same careful attention should be paid to watering, which at this stage must be copious when moisture is needed. The best time to water the roots is just before the trees are syringed and again first thing the following morning; the trees then have full benefit of moisture through the night. Syringe the houses early on bright mornings and so late as 4 p.m. in the afternoons, as trees with fruits ripening should retain moisture on their leaves for some hours. Mulching is as necessary as ever and a mulch should be applied little and often, mixed with bone-meal, etc. Diluted liquid manure cannot be surpassed, not only for watering the roots, but for damping purposes, and short, fresh stable litter will absorb and give off moisture as well as prevent rapid evaporation of water from the soil in hot, dry weather.

**Later Trees.**—The pinching and disbudding of the shoots may be done on the free side after this date, and the fruits on each tree thinned to a suitable number for the tree to mature, as there will be little danger now of the fruits dropping. If the weather continues to improve open the ventilators and doors by day and partially close them at night. As with the earlier trees, watering, top-dressing and feeding call for constant attention. As the trees grow, the strongest young shoots should be pinched at the fifth or sixth leaf, or less, according to their size and the space available for them. Weak growths near the base of the tree may not require pinching at all. By this means, and with liberal syringing, insect pests should be kept in check, and if not, the grower should resort to light fumigations. If space in the house is limited, very early Pears in pots may be placed out-of-doors early in June, but very choice varieties of Pears and Apples should be kept in the house.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Grafting.**—The bark of all kinds of fruit trees will now lift readily, and the work of grafting should be completed forthwith. If the scions are suitable and carefully placed on the stock no difficulty should be experienced in getting every graft to unite. Examine trees that were grafted earlier in the spring and make good the clay coverings where they may have cracked, for it is most important to exclude the air at the union of stock and scion. Espalier trees of both the Pear and Apple are best grafted on the upper sides of the branches. See that each variety is labelled correctly.

**Orchards.**—To obtain the best results from grass orchards the grass should be kept very short, the heads of the trees carefully thinned, and the roots well nourished. Trees that have become unproductive through neglect should receive attention with a view to the restoration of their vigour. If not done already, place a top-dressing of well-decayed farmyard manure or some other approved fertilizer over the roots. The application of lime will prove very beneficial on soils deficient in calcareous matter. Liquid manure applied at intervals until the roots and soil have become thoroughly

moistened to a good depth will also benefit the trees, for if the roots of large trees are allowed to get dry and the soil hardened much watering is required to moisten them effectually.

**Last Season's Grafts.**—Where the grafting was successful last season and the scions are making good headway, supports will be needed to prevent them being damaged by high winds, especially in exposed situations. Fasten suitable stakes to the stocks on which the grafts are growing and secure the grafts to these. Make examinations at intervals to see that the ties are in good order and make good any that are not.

**Protecting Materials.**—In warm, sheltered districts, material used for protecting the blossoms of fruit trees may be dispensed with entirely, but until the danger from cold winds is over the nets may be allowed to remain in position, as the young growths are very liable to injury when a sudden change from warm to cold weather sets in, and this not infrequently happens in our climate.

## THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Pruning Flowering Shrubs.**—Shrubs that flower on wood made the previous year usually require pruning so soon as they have finished flowering. *Forsythia suspensa* is a good example of this class of shrub. Where this plant is trained on walls or pillars this annual pruning is very essential. *F. viridissima*, *F. intermedia* and its fine variety *spectabilis*, are of a stiffer and more bushy habit, and annual pruning is not so necessary in their cases. *Prunus triloba* var. fl. pl., which is so fine when trained on a wall, should always be pruned when it has finished flowering. Some of the early-flowering species of *Ceanothus* that are used as wall shrubs should receive what pruning they require so soon as they have finished flowering, thus allowing them plenty of time to complete and ripen their growth before winter. Both the *Philadelphus* and *Diervilla* (*Weigela*) should have at least a portion of the old wood cut out after flowering. *Jasminum nudiflorum* should also, when necessary, be pruned after flowering. As a general rule, shrubby plants that flower on the current year's wood should be pruned during early spring, two well-known examples being *Buddleia variabilis* and its varieties, and *Ceanothus Gloire de Versailles*.

**Live Edgings.**—Where it is necessary to repair or relay Box edgings, the present is a suitable time to undertake this work, for the plants will grow away freely. *Santolina Chamaecyparissus*, the Lavender Cotton, makes a beautiful edging plant and might be more generally used for this purpose: it is easily propagated by means of cuttings or division.

## FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Gladioli.**—The corms of these beautiful summer and autumn flowers should be planted now. Where the soil is stiff and heavy the addition of sand, both below and above the corms, is to be recommended; where the soil is naturally light this is not necessary, but the addition of well-decayed cow manure will result in the development of splendid flower spikes. The larger-flowered varieties look extremely well when grown in large clumps or masses, and may be used very effectively in the scheme of summer-bedding if interplanted with some of the intermediate forms of *Antirrhinums*, etc. The *Primulinus* section of *Gladioli* offers a fine range of colouring, and the more loosely-built spikes of this type lend themselves much better for use as cut-flowers than the stiffer spikes of the large-flowering types. If increase of any particular variety is desired, the small bulbs which form around the main one should be saved in the autumn, and planted in sandy soil; they

will soon grow to flowering size; in fact, quite a number of these small bulbs flowered in these gardens late last season, and it is hoped that most of them will do so again this year. The early-flowering section includes some beautifully-coloured flowers, varying from the pure white of *G. Colvillei* The Bride through various pinks, such as *Peach Blossom*, to the deeper reds of *Brilliant* and *Crimson Queen*; they are all extremely useful for cutting during June and July.

**Bedding Violas.**—These may now be planted in their summer quarters; indeed, a greater measure of success is attained with these moisture-loving plants by putting them out early, than by deferring their planting until drier and warmer weather prevails. They are extremely useful as edging or carpeting plants, and are procurable in almost any shade of colour which may be required to contrast or harmonise with the other subjects in the beds or borders.

sown in pots under glass; the plants will be ready for transferring to their permanent positions out-of-doors early in June. Earlier-raised plants may be potted on, or placed on a partially spent hot-bed, where they can be protected on frosty nights; they will soon grow freely. It is necessary to pollenate the flowers of these early plants; even in the case of maincrop Marrows it is a good plan to pollenate the earliest female flowers by hand in cold districts.

**Potatoes.**—The planting of the later varieties of Potatoes should be completed at an early date. Late sorts should be planted more widely apart than early varieties, both between the rows and between the sets, especially in rich garden soil, where top-growth is usually very strong. Stir the soil by forking between the rows of Potatoes above ground, and when the soil is in good order earth them up. The very earliest crops growing at the foot of a south wall are

FIG. 146.—TRIFOLIUM UNIFLORUM.

(see p. 300).

Cuttings rooted last autumn are in excellent condition for making new plantings, and where the old plants have survived the winter these may be divided and replanted, should there be any deficiencies to make good. The ground should be enriched with well-decayed manure, deeply buried; the dung will provide both food and moisture in times of drought. Pansies also should be planted now in well-tilled ground. Take the usual precautions to protect these young and tender plants from slugs and other pests.

**Sowing Perennials and Biennials.**—Seeds of many kinds of both perennial and biennial flowers may now be sown to raise plants for transplanting next autumn and spring. The smaller seeds, such as those of Canterbury Bells, etc., should be sown either in a cold frame or in boxes, but the larger ones, such as Wallflowers, Delphiniums, Lupins, etc., may be sown in nursery rows in the open.

**Vegetable Marrows.**—The maincrop of Vegetable Marrows should now be raised from seeds

approaching the interesting stage when it will soon be possible to secure an early dish of tubers, which are always much appreciated. Ground which has been occupied by late crops, such as Leeks, Brussels Sprouts and early Broccoli may be used for the Potato crop or other root crops without the addition of fresh manure. Most gardeners rely on outside sources for their supplies of late Potatoes, but where practicable a quantity should be grown, as this gives the soil a rest from a never ending green crop, and brings it into good condition for a succeeding crop.

**Celery.**—Celery trenches should be made in good time as this will enable various catch crops to be grown successfully on the ridges; these may include Spinach, Lettuces, and, later, a sowing of dwarf French Beans, before the soil on which they are growing is required for earthing up the Celery, the seedling plants of which are now ready for transplanting into frames. Where spot disease is troublesome spray the seedlings, so soon as they are in the trenches, with Bordeaux mixture.

## FLOWER GARDEN.

## PERENNIAL LOBELIAS.

THESE Lobelias are very effective along the banks of streams, in the bog garden, or by the side of a lake. In such places they grow luxuriantly in the hottest weather, whilst often in the ordinary border they suffer quickly from drought.

The newer varieties recently sent out by Messrs. Ladhams embrace many shades of colour, from white, mauve and purple to bright and deep crimson; the bronze foliage of the last shows to best advantage in damp situations.

In these gardens perennial Lobelias are planted in beds of *Azalea mollis*, where they make a good show when the *Azaleas* are over, and also blend well with the autumn foliage of the latter. They are quite at home in the damp, peaty soil without any manure.

The *Syphilitica* types are hardy, but it is well to give the plants protection from frost in damp surroundings. The *Cardinalis* types should be wintered in cold frames; they will withstand a few degrees of frost if kept on the dry side. *Firefly* and *B. Ladhams* stand out pre-eminent amongst the crimson varieties, whilst *Purple King* and *Blue Bird* make a fine contrast. The old variety, *Queen Victoria*, is very effective when interspersed with the white variety *Snow Queen*. *R. Gunlner, Heywood, Gardens, Cobham, Surrey.*

## TROPAEOLUM TUBEROSUM.

As an outdoor subject, this plant, which was introduced from Peru about two centuries ago, has not been a success with me. In a warm soil and sunny aspect it is so easily retarded by drought that it does not flower until autumn is far advanced. On the other hand, plants in a cooler, richer soil with less sun develop much foliage and scarcely any bloom. Even tubers started indoors and put out in May do not grow quickly enough to be of much use.

Others may have been more successful with the plant, which might do well in a really fine, warm autumn. But my experience in the long run is that *T. tuberosum* is not worth growing, especially as there are many better and more satisfactory plants of the kind. The leafage is undoubtedly attractive, but the scarlet and yellow flowers seem to stop just short of being showy. *J., N. Wales.*

## ALPINE GARDEN.

## TRIFOLIUM UNIFLORUM.

THIS species is one of the few members of the large and widespread family of Clovers which are of value from the point of view of garden decoration. It is a dwarf perennial of tufted habit, with short, prostrate shoots of a purplish tint, bearing trifoliate leaves, on slender stems about one-and-a-half inch in length, which are marked on the upper side with single, shallow grooves. The leaflets are ovate, pointed, with sharp-toothed margins, and are up to half-an-inch in length. They are quite attractive in themselves, being of a rich green colour, lightly blotched with dark purple, slightly clothed with silvery, adpressed, silky hairs upon the upper surface, and glabrous beneath.

The flowers are both quaint and attractive, and in contradiction to the name, are usually borne in clusters of three during May and June. The corolla is about twice the length of the calyx, and consists of a prominent rose-lilac standard and either pale yellow or white wings and keel. It is a dainty little plant (Fig. 146) probably somewhat variable in floral colouring, and suitable for a well-drained, sunny position in the rock garden, or for pot culture in the alpine house, being free both in growth and production of flowers. It is well illustrated and described in Sweet's *Flower Garden*, Vol. v, but is seldom referred to in other standard works. *A. G. F.*

## RANUNCULUS AMPLEXICAULIS.

*RANUNCULUS amplexicaulis* is one of the very best of the hardy Crowfoots; it is fairly common in the Alps and the Pyrenees. Unlike some members of the genus, it keeps to its allotted space without crowding out its neighbours. Under suitable conditions it attains a height of about two feet, and its large flowers—often an inch or more in diameter—are produced freely and are very pleasing during April and May; they are pure white with bright yellow centres.

The leaves are of a glaucous grey-green, and, as the specific name indicates, stem-clasping. The radical leaves are lanceolate and stalked.

A rather heavy, moist rooting-medium provides ideal conditions for the perfect development of this plant; it will, however, grow in less congenial surroundings, but the size of the plant and flowers will be reduced.

This Crowfoot is a very desirable subject for the rock garden, wild garden or flower border. *T. H. Everett.*

## TRILLIUM SESSILE.

*TRILLIUM sessile*, the Trinity Flower or Wood Lily, often flowers in March, when its blossoms are highly appreciated, but the ordinary forms of *T. sessile* have dull brown or brownish flowers. The variety *T. sessile californicum* is more beautiful than the type and comes nearest to rivaling *T. grandiflorum*. It has white flowers of much beauty, set almost stemless above the leaves of the plant. They are not so snow-white as those of *T. grandiflorum*, being more of a creamy tint and, in my estimation, the claim of some that *T. sessile californicum* is superior to *T. grandiflorum* cannot be maintained. But its earliness is a great asset in its favour, and where more than one Wood Lily can be grown *T. sessile californicum* should be added. The plant is not difficult to cultivate; it should have partial shade and a fair amount of moisture. *T. sessile Wrayi* is inferior to *T. s. californicum*, as the flowers are generally greenish. Propagation of these Wood Lilies is effected by division after flowering. *S. Arnott.*

## TREES AND SHRUBS.

## BERBERIS JULIANAE.

THIS Chinese *Berberis* forms a strong, dense, evergreen shrub, and is suitable for use as a specimen plant or for grouping. Never before have I seen this shrub so finely in flower as this spring, for at almost every node there is a cluster of blossoms.

As a specimen plant it attains to a height of eight feet to ten feet and even more through; it extends by throwing up strong growths close to one another.

The young shoots are grey and slightly angular; they are armed with strong, three-parted spines, and carry bright dark green foliage. The leaves vary in size and shape, the greater proportion being about three inches by one inch, sub lanceolate in shape, margined with fine, sharp spines; other leaves are oblanceolate, with the leaf blade tapering to the very short petiole. The veins are distinct and raised slightly above the leaf surface, and less so on the pale green under-surface. As the winter buds open, the scales that cover them are attractively red.

The flowers develop in rather large clusters for a *Berberis*, and number from ten to twenty; they are bright yellow. The thin pedicels emit a pollen-like odour. The fine weather during the time the plants have been in flower may result in a fine crop of berries which have not been plentiful in past years, for late spring frosts are inclined to damage the flowers. The fruits are black and pruinose, half-an-inch long, narrow, and contain usually one seed in a deep crimson pulp.

As this *Berberis* is offered in the Wisley distribution list, I commend all who have the chance to avail themselves of the opportunity to secure it. *C. F. C.*

## SYCOPSIS SINENSIS.

THIS evergreen, winter-flowering shrub is of recent introduction from China and should be included in every collection. It has a neat habit and attains a height of about eight feet. The leaves are coriaceous and from two inches to three inches long. The species is perfectly hardy and requires no special soil.

The reddish-yellow flowers are produced in rounded heads from the axils of the leaves, during January and February. Whilst not so striking as the *Witch Hazels*, the curious, rounded flower-heads, and the fact of the plant being evergreen, are points of interest. *S. R. D.*

## RHODODENDRON LUTESCENS.

CAPTAIN STEWART, Shambellie, Newabbey, Kirkcudbrightshire, has for some years been keenly interested in the species of *Rhododendron*, of which he has an exceedingly good collection, many having been raised at Shambellie from seeds. Many of his seedlings have not reached full flowering size, but their healthy, vigorous appearance gives a promise of plenty of flowers in due course. I had the pleasure of visiting Shambellie recently, and at that time, the only *Rhododendron* species in bloom was the graceful *R. lutescens*, of which there is a good specimen in the grounds near the house. The plant was in full flower and carried an abundance of its charming pale-yellow flowers, which are of the most elegant form.

At Shambellie, there is an admirable setting for these grand shrubs. They are planted in comparatively open places in the woods near the house, and *R. lutescens* looked exquisite with the ground rising behind it like an amphitheatre and huge granite boulders partly covered with moss as a foil to the plant. *S. Arnott.*

## ORCHID NOTES AND CLEANINGS.

## MASDEVALLIA IGNEA.

THIS free-flowering species, with its many varieties, bears its bright flowers on erect stems, eight to twelve inches long. The colour is bright cinnabar-red, with crimson veins. The upper sepal ends in a deflexed tail, while the two lower ones are merely pointed.

The plants do not form pseudo-bulbs as so many *Orchids* do, and under cultivation they require cool, moist treatment all the year round. Water may be partly withheld during the winter months, but on no account should the plants become dry. In summer, they require a liberal supply of water and must be protected from the strong rays of the sun.

A good potting medium consists of equal parts of *Polypodium* and *Al fibre*, mixed well with *Sphagnum*-moss, crocks and charcoal, to ensure free drainage. Pots of four inch size are very suitable, and when the plant is potted, it is a good plan to surface the compost and the growing crowns with *Sphagnum*-moss. This will require renewal during the summer months but when the *Sphagnum* threatens to cover the plant, it should be removed and the crowns again inserted.

*M. ignea* is a useful companion to *M. coccinea* and its varieties, and is valuable, although its merits in this respect are not widely known, as a plant for table decoration. *J. Robbie.*

## OPHRYS APIFERA.

THE *Fee Orchid* is one of the most interesting and beautiful of the British representatives of the Natural Order *Orchidaceae*. Not by any means common, it is found most frequently on dry, chalky pastures in the southern and eastern counties of England; it also occurs more rarely in other parts of England and in Ireland.

Usually three to six flowers are produced on the spikes, during June, but occasionally so many as seven or eight flowers are borne on each spike. The sepals are either pink or pale green or white marked with pink. The petals are smaller and narrower than the sepals; the lip is broad,

## THE WORLD'S FINEST DAHLIAS FOR BEDDING

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.——No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about 1½ feet in height.

### JANET

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Rich deep apricot, with a suffusion of deep orange—a glorious colour; the individual flowers are not quite so large as those of 'Coltness Gem,' and it is of rather more dwarf habit. In freedom of bloom, upright stems carrying the flowers clear of the foliage, and general characteristics, it is a counterpoint, a fine companion, to 'Coltness.'

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

#### PRICES:

COLTNESS GEM—	doz.	100
Strong plants in small pots	6/-	45/-
Strong plants in $3\frac{1}{2}$ in. pots	7/6	55/-
Extra large in 5 in. pots	12/-	& 15/-

Mention this paper.

convex, and of a rich velvety-brown colour, with paler markings. It does not require a very powerful imagination to see the likeness between the flower and a humble bee at rest.

When collecting this plant for naturalisation, it would be a great mistake to lift it when in flower; a far better plan is to mark the position of the plant for removal at a later date, and then to dig it up with the greatest care, without damaging the tubers. As seeds are freely produced they form a ready means of increase and this method is to be preferred to the practice of lifting plants from localities where they are at all scarce.

A sunny position in the rock garden suits the Bee Orchid admirably, and the compost in which it is planted may consist of a rather heavy loam with the admixture of some limestone or chalk. A carpeting of some dwarf alpine subject aids in providing suitable conditions for successful growth. *T. H. Everett.*

## INDOOR PLANTS.

### SALVIA GREGGII.

This very pretty Sage is not quite hardy, except in very favoured localities and, as with its brightly-coloured congener, *S. Grahamii*, it is wise to propagate the plant annually. Cuttings root readily if inserted during the late summer.

The flowers are produced, six to eight, in short racemes; the corolla is a telling shade of carmine. The linear leaves are coloured a rather dull green, and the plant is decidedly ornamental, making a good subject for a cool house, especially when planted out. The average height is three feet. *S. Greggii* was introduced from Northern Mexico in 1885, and is figured in *Bot. Mag.*, tab. 6812. *R. E. Arnold.*

### AUDOUNIA CAPITATA.

This plant was formerly known as *Diosma capitata*, a name under which it was described by Linnaeus, but it is not now even included in the same Natural Order as *Diosma*.

It is a Heath-like plant from South Africa, suitable for cultivating in the cool greenhouse. In the early part of the year the erect branches are terminated with corymbs of small, pinkish-lilac flowers which remain in good condition for a considerable period.

A compost made of fibrous peat, loam and sharp sand forms an excellent rooting-medium, although the addition of peat to the potting soil is not so important as is the case with *Ericas*, and the *Audouinia* will thrive quite well if leaf-mould is substituted. Practically no pruning is required, as the plant naturally forms a shapely specimen.

Propagation is effected by cuttings of young wood treated in the same manner as those of Heaths, but *Audouinia* cuttings strike much more readily than do those of Heaths. *T. H. Everett.*

## SPRING FLOWERS IN REGENT'S PARK AND HYDE PARK.

BOTH in Regent's Park and Hyde Park spring flowers in variety are contributing to the enjoyment of visitors, and the display promises to last for some time to come. The Daffodils are nearly over, but these early flowers are being followed by a variety of beautiful Tulips, of which there are very large beds in both parks.

The wide grass border in front of the herbaceous border on the west side of the flower garden in Regent's Park has been very effective for some considerable time, with Daffodils and Hyacinths in the turf. The latter flowers having done exceedingly well naturalised in this way, and their effectiveness has been intensified by wide planting in irregular groups.

The clearance in front of the shrubbery by St. Andrew's Gate, where the Dahlias are grown later in the year, presents a galaxy of colour from great plantings of Daisies, winter-flowering Pansies, Polyanthus, Wallflowers

and Stocks, and it was a happy idea to spring this surprise on the visitor immediately on entering the Park from this end. Some of the beds in the flower garden are also gay with spring flowers, the most effective being those planted with single Wallflowers, with double Wallflowers, with *Cheiranthus Allionii*, which is a little backward this season, and only just now expanding its blossoms; with the Spetchley strain of Polyanthus and with *Primula malacoides*.

Probably the most effective of the whole of the beds is the large circular one of Polyan-

Broad patches of colour are also provided by beds of such early Tulips as *Couleur Cardinale*, *Pride of Haarlem* and *Rising Sun*, the last a beautiful golden variety well adapted for bedding and one of the earliest to bloom. Others, such as *Pride of Haarlem* and *Farncombe Sanders*, are following closely and others that are later still will carry on the display for a long time to come. The other principal subjects in flower are Pansies, Daisies, Wallflowers and Daffodils; seen in the distance, a corner in the foreground of one of the shrubberies appears to be a blaze of gold, which a

FIG. 147.—NARCISSUS PAPHOS.

R.H.S. Award of Merit, London Daffodil Show, April 13, 1926. A beautiful, firm-textured poeticus variety shown by Mr. A. Secrett. Selected for trial at Wisley, for Market purposes, on April 26. (see p. 310).

thus, every plant of which seems to be a perfect specimen, and bears a wealth of flowers, whilst the colouring of the whole is most varied and harmoniously blended.

The bed of *Primula malacoides* presents a very pretty sight from the distance, appearing like a soft carpet of the palest pink, and the use of this plant for spring bedding may be recommended to others.

Hyde Park has most to offer, in the way of flowers, in the beds near the Diana Fountain by Hyde Park Corner. Here, again, is a very fine circular bed of mixed Polyanthus equalling the one in Regent's Park in the beauty, effectiveness and grouping of the plants for colour effect.

close up inspection reveals to be *Cloth of Gold* Wallflower; it is one of the most conspicuous objects in the Park. But the most interesting of the various subjects in bloom is *Daphne Cneorum*, of which there is a big group in the same shrubbery border as that which contains the golden Wallflowers. It is very interesting to see this choice plant succeeding so well in a London park.

There are other beds in The Dell gay with spring flowers of a similar nature, but the grandest effect has been in the grass next to Park Lane, where thousands upon thousands of Daffodils have provided an almost continuous sheet of flowers along nearly the whole of this end of the Park for some weeks past.

BY APPOINTMENT

## THE WORLD'S FINEST DAHLIAS FOR BEDDING

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.—No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about  $1\frac{1}{2}$  feet in height.

### JANET

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Rich deep apricot, with a suffusion of deep orange—a glorious colour; the individual flowers are not quite so large as those of 'Coltness Gem,' and it is of rather more dwarf habit. In freedom of bloom, upright stems carrying the flowers clear of the foliage, and general characteristics, it is a counterpoint, a fine companion, to 'Coltness.'

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

#### PRICES:

COLTNESS GEM—	doz.	100
Strong plants in small pots	6/-	45/-
Strong plants in $3\frac{1}{2}$ in. pots	7/6	55/-
Extra large in 5 in. pots	12/- & 15/-	—

#### ADA, also JANET—

Strong plants in small pots	7/6	55/-
Strong plants in $3\frac{1}{2}$ in. pots	10/6	80/-
Extra strong in 5 in. pots	15/-	—

All will bloom freely this season.

## Ryders

### NEW DWARF BEDDING DAHLIAS

Pot roots can be planted right away just as one plants bulbs. The plants form vigorous bushes 15 to 18 inches high. These are covered with masses of single flowers in the most beautiful Dahlia colours. The earliest of all Dahlias, and continues in beauty until frost comes. Dormant pot roots form stronger, larger, and more floriferous plants than those from cuttings. 6 for 4/3 12 for 8/- (in rich variety) carriage paid. If you have not yet received a copy of Ryders Spring List send a post card to-day to

convex, and of a rich velvety-brown colour, with paler markings. It does not require a very powerful imagination to see the likeness between the flower and a humble bee at rest.

When collecting this plant for naturalisation, it would be a great mistake to lift it when in flower; a far better plan is to mark the position of the plant for removal at a later date, and then to dig it up with the greatest care, without damaging the tubers. As seeds are freely produced they form a ready means of increase and this method is to be preferred to the practice of lifting plants from localities where they are at all scarce.

A sunny position in the rock garden suits the Bee Orchid admirably, and the compost in which it is planted may consist of a rather heavy loam with the admixture of some limestone or chalk. A carpeting of some dwarf alpine subject aids in providing suitable conditions for successful growth. *T. H. Everett.*

## INDOOR PLANTS.

### SALVIA GREGGII.

This very pretty Sage is not quite hardy, except in very favoured localities and, as with its brightly-coloured congener, *S. Grahamii*, it is wise to propagate the plant annually. Cuttings root readily if inserted during the late summer.

The flowers are produced, six to eight, in short racemes; the corolla is a telling shade of carmine. The linear leaves are coloured a rather dull green, and the plant is decidedly ornamental, making a good subject for a cool house, especially when planted out. The average height is three feet. *S. Greggii* was introduced from Northern Mexico in 1885, and is figured in *Bot. Mag.*, tab. 6812. *R. E. Arnold.*

### AUDOUINIA CAPITATA.

This plant was formerly known as *Diosma capitata*, a name under which it was described by Linnaeus, but it is not now even included in the same Natural Order as *Diosma*.

It is a Heath-like plant from South Africa, suitable for cultivating in the cool greenhouse. In the early part of the year the erect branches are terminated with corymbs of small, pinkish-lilac flowers which remain in good condition for a considerable period.

A compost made of fibrous peat, loam and sharp sand forms an excellent rooting-medium, although the addition of peat to the potting soil is not so important as is the case with *Ericas*, and the *Audouinia* will thrive quite well if leaf-mould is substituted. Practically no pruning is required, as the plant naturally forms a shapely specimen.

Propagation is effected by cuttings of young wood treated in the same manner as those of Heaths, but *Audouinia* cuttings strike much more readily than do those of Heaths. *T. H. Everett.*

## SPRING FLOWERS IN REGENT'S PARK AND HYDE PARK.

BOTH in Regent's Park and Hyde Park spring flowers in variety are contributing to the enjoyment of visitors, and the display promises to last for some time to come. The Daffodils are nearly over, but these early flowers are being followed by a variety of beautiful Tulips, of which there are very large beds in both parks.

The wide grass border in front of the herbaceous border on the west side of the flower garden in Regent's Park has been very effective for some considerable time, with Daffodils and Hyacinths in the turf. The latter flowers having done exceedingly well naturalised in this way, and their effectiveness has been intensified by wide planting in irregular groups.

The clearance in front of the shrubbery by St. Andrew's Gate, where the Dahlias are grown later in the year, presents a galaxy of colour from great plantings of Daisies, winter-flowering Pansies, Polyanthus, Wallflowers

and Stocks, and it was a happy idea to spring this surprise on the visitor immediately on entering the Park from this end. Some of the beds in the flower garden are also gay with spring flowers, the most effective being those planted with single Wallflowers, with double Wallflowers, with *Cheiranthus Allionii*, which is a little backward this season, and only just now expanding its blossoms; with the Spetchley strain of Polyanthus and with *Primula malacoides*.

Probably the most effective of the whole of the beds is the large circular one of Polyan-

Broad patches of colour are also provided by beds of such early Tulips as *Couleur Cardinale*, *Pride of Haarlem* and *Rising Sun*, the last a beautiful golden variety well adapted for bedding and one of the earliest to bloom. Others, such as *Pride of Haarlem* and *Farncombe Sanders*, are following closely and others that are later still will carry on the display for a long time to come. The other principal subjects in flower are Pansies, Daisies, Wallflowers and Daffodils; seen in the distance, a corner in the foreground of one of the shrubberies appears to be a blaze of gold, which a

## LILIES AND MANURE.

JUDGING by much that is written from time to time in the columns of the horticultural press in deprecation of the use of manure in the cultivation of Lilies, it seems clear that a good deal of misconception prevails on the subject. This may possibly be because those who condemn the employment of manure for the particular purpose may not have had any extended personal experience in the use of it, or may not have used it in the right way; but whether that is so or not, it is undoubtedly the case that those who have used manure intelligently find that it has the same stimulating effect on Lilies as it has on plant life in general. That, however, does not mean that they use it indiscriminately in the cultivation of the genus, for there are many garden soils which need no heartening. Then, too, the charm of many of the more refined species lies in their natural elegance and the proportion of part to part. That proportion is soon upset by high feeding, and then the plants may become gross travesties of their natural selves.

In a general way most of the Lilies which lend themselves to outdoor cultivation in this country undergo a change when in the environment of a garden, and *L. Henryi* is a classic instance of such change. In the wild state, Henry never saw a plant with more than five flowers, nor E. H. Wilson one with more than ten. Yet, when grown in gardens, twenty blooms to a stem is quite an ordinary allowance; it is the same, too, with *L. auratum*, and those who habitually grow that Lily as well as *L. speciosum*, *L. longiflorum* and *L. tigrinum*, in pots, know the stimulating value of liquid manure; indeed, it is systematically used in the cultivation of Lilies in pots, and provided the process is not carried to unreasonable lengths, as it sometimes is, especially in the case of *L. auratum*, the Lilies named, and many others, suffer no loss of beauty or interest from the stimulation. In fact, except where naturally rich soil is available, it is doubtful if what is called high cultivation is possible without manure of some kind. The same process is noticeable in Nature when the dwarfed, uni-flowered, thin-leaved Lily of dry, stony hill-sides drops its seed into a rich pocket and emerges as a floriferous giant, its stem clothed in leaves—incidentally, a veritable trap for students of herbarium specimens unaware of field conditions and lacking informative field tickets.

But there are manures and manures, and no gardener in possession of his senses would bring fresh stable, yard, or other animal manure into direct contact with Lily bulbs, nor would he use it in soil which is sufficiently rich without extraneous additions. There is no objection, however, to the use of such manure in the subsoil where it is away from all contact with the bulbs, but is within reach of the roots. Unbelievers can settle the point for themselves by planting a batch of any of the more robust Lilies over manure and a similar batch in the same soil but without manure.

In his *Notes on Lilies*\*, Alexander Wallace wrote:—"With regard to manure, it is generally held by Lily growers of experience that the application of fresh manure is fatal to the bulbs.

We have found a mulching of thoroughly rotten manure during the winter months advantageous, but we cannot advise that manure, fresh or old, should be dug in when the bulbs are planted; liquid manure may be freely applied during the growing and blooming season. The Japanese, great Lily growers, give their bulbs a top-dressing of night-soil in the winter months." This sounds contradictory, for bulbs which will tolerate manure-water freely applied in the growing season and night-soil in the dormant season, will tolerate anything; and it probably did not occur to Wallace to make it clear that when dug in below the bulbs, manure is beneficial.

As Dutch nurserymen have long since found, cow-dung is an excellent manure for Lilies; if it is old and dry it may be broken up to powder and mixed with the soil in which the bulbs are planted; if new, it should be buried below the bulbs. This type of animal manure is more useful for light or sandy soils than for those of heavier texture, because it has no mechanical effect on the ground as has yard and stable manure.

In 1919, the writer made two experimental seed-beds for seeds of *L. regale*. They were side-by-side, in a kitchen garden, slightly sloping to the south and sheltered from all winds by a high wall. The beds were ten feet long

FIG. 148.—BLUE POPPIES (*MECONOPSIS BETONICIFOLIA* VAR.) IN AN ALPINE MEADOW IN THE SEINGHKU VALLEY.

(see p. 303).

and one foot wide and were recessed two inches into the ground. Each was of the same prepared sterilised soil with the same subsoil, and while under one there was a four-inch layer of fresh cow manure at a depth of three inches from the surface, the other had no manure. The manure was simply so many "pats" shovelled off an adjacent meadow, dropped into place to the required thickness, and smoothed over with a spade.

The seeds were sown at the beginning of March, and the beds covered with sheltering boughs of Pine laid flat. At the end of April, this protection was removed, and an inch of fine leaf-mould and grit sifted over the surface of each bed. Each had identical treatment as regards watering and the removal of such few weeds as made their appearance.

The seeds germinated simultaneously in each bed, and so far as the eye could see, the seedlings grew neck and neck till the middle of August, when those in the manured bed appeared to have no advantage over the others. Thence onwards, however, there was a change, doubtless because, by that time the roots of the seedlings in the manured bed had reached the cow-dung; the manured plants gained quickly on the others, and by the end of September the difference was

remarkable. When the bulbs were lifted at the end of October there was a much greater proportion of those of large filbert size in the manured bed than in the other. Three bulbs flowered at eight-and-a-half months from sowing in the manured bed and one in the other.

Famous Lily growers of the past generation, like Wölley Dod, Miles, Harpur Crewe, Mangles and Elwes, did not hesitate to use manure when they thought their plants would benefit thereby, and there are many references to the subject in the horticultural journals of the time. Writing in the *Horticultural Journal* fifty years ago, for instance, R. T. Clarke observed that "*L. testaceum* luxuriates in strong loam, heavily manured." When he first began cultivating Lilies at Wisley, Mr. G. F. Wilson, the famous amateur cultivator of the genus of the last generation, fought shy of manure, and was at pains to make it clear that the fine examples he so often sent to the shows of the R.H.S. were not due to the use of stimulants, as was generally supposed at the time. But later on he used manure freely for the stronger-growing species, and he may have been influenced by an incident which he reported in *The Gardeners' Chronicle*\* in the following words:—"A friend lately brought me from his garden in Norfolk a bulb of *L. giganteum* and told me how the Lily was grown there. As the treatment is rather different from what I have tried and heard of, and seems to be thoroughly successful, I requested a note of it, and this may, I think, be useful to some of your readers. The bulbs were planted by the side of a rich vine border, which had a heavy dressing of horse and cow manure. These have grown strongly, have flowered and seeded, while other bulbs planted near, but not in such rank stuff, do not make such large bulbs, and have not flowered."

*L. giganteum* responds to gross feeding, and the finest plants the writer has seen were growing over the carcass of a favourite pony, to which the Lilies were an appropriate memorial. No doubt the well-known carnivorous habits of this Lily were responsible for the story of the insane cultivator of the genus, whose plantations of *L. giganteum* were kept in unrivalled form by the bodies of his friends whom he murdered in order that they might furnish the necessary nourishment for the bulbs!

The use of natural manure—stable, farm, cow or pig—often brings with it a certain fouling of the ground by the introduction of insects which seem to regard Lily bulbs as their special province; to a greater or lesser degree the same may be said of leaf-mould, though not of peat-moss dust, and in a measure the evil may be met by the partial sterilisation effected by bi-sulphide of carbon. Where no alteration of the texture of the ground is required, potash is a most convenient stimulant for Lilies, for its use involves none of the disadvantages attaching to organic manures. In the form of wood-ash it is generally available in gardens of any size, and as potash is soluble, the wood-ash must be kept dry till it is needed. If ash is not available, kainit may be employed, or sulphate of potash, but the former should not be used for calcifugal species. The quantity usually recommended is 4 lb. to the rod, which means little or nothing to amateurs in general. But if they lightly powder the ground with potash so soon as the stems are a few inches high, and fork it into the surface soil about the stems, it will be sufficient. The writer has had entirely satisfactory results from the use of Adc., which has much the same mechanical effect on the ground as straw manure and a high manurial content as well.

Science insists that humus, in the form of peat and leaf-mould, has no manurial value, and the fact, so often noticed, that the basal roots of a Lily will fasten on the minutest piece of peat in the ground within reach, probably only means that the peat is better aerated than the rest of the ground. The same cause is doubtless at work to make the aerial roots of all stem-rooting Lilies fasten into a spongy superficial mulch of leaf-mould. This mulch should always be mixed with grit, or there is a risk that the plants may be smothered. The successful cultivation of most of the stem-rooting

\* Second edition, p. 10 (1879).

\* March 24, 1877, p. 277.

Lilies depends on the development of the roots at the base of the stem, and a mulch of spent manure mixed with leaf-mould and grit generally brings its own reward. The mulch serves a double purpose for it also shelters the stem roots from the sun; once these roots have been shrivelled by drought or sun-stroke the fate of the stem and flowers is beyond question.

In a general sense, the following Lilies benefit by the use of manure in the subsoil:—*L. auratum*, *L. speciosum*, *L. tigrinum*, *L. monadelphum*, *L. Martagon*, *L. candidum*, *L. chalcidonicum*, *L. croceum*, *L. sulphureum*, *L. testaceum*, *L. Hansonii*, *L. Henryi*, *L. centifolium* and *L. giganteum*. On the other hand, the Californian Lilies, with the exception of *L. pardalinum* and *L. Humboldtii*, are not of the class to which one would apply manure; nor is Farrer's variety of *L. Duchartrei*. *L. philadelphicum*, *L. rubellum*, *L. tenuifolium* and *L. meadoides*, too, are better without it. A. Grove.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA.\*

### X.—FROM SUB-TROPICAL JUNGLE TO ALPINE MEADOW.

IN the course of an ascent from sub-tropical jungle to alpine meadow, social upheavals take place in the vegetation. At my base camp, for instance, no two trees of the same species kept company; there was almost infinite variety, each tree being surrounded by other species. Fifteen hundred feet higher up, where the forest is often equally dense, species become more sociable, more tolerant, and there is less variety. Magnolias and tree Rhododendrons own much of the land, and though they seem to get on all right together, they are very chary of letting outsiders stake claims. I passed through whole groves of *Magnolia mollicomata* (which is very like *M. Campbellii*), and here *Rhododendron giganteum* (or other of the 'Grande' series) and a tall tree 'Thomsoni' with pinkish flowers, formed the bulk of the forest.

Still higher, the forest consisted almost entirely of *Abies*, with an undergrowth of big-leaved Rhododendrons. Where the Conifer forest begins, a dense mixed tanglewood covers the more sheltered side of the valley. Here may be found *R. aureum*, *R. strigillosum* and other species; *Viburnum Wardii*, *Magnolia globosa*, species of *Enkianthus*, *Acer*, *Berberis*, *Cotoneaster*, *Rosa*, *Pyrus*, *Prunus*, etc. On the exposed flank, however, there is practically nothing but impenetrable thickets of Rhododendron, including species of the 'Souliei', 'Sanguineum' and 'Haematodes' type, with small colonies of the beautiful *R. tephropeplum* in the hollows of the cliffs and the 'Falconeri' species wherever *Abies* gets a foothold.

Lastly, we come to the highest alpine moorland, covered with a knee-deep carpet of 'Laponicum' Rhododendron (three species), amongst which nestle still smaller colonies of *R. rivulare* and an 'Anthopogon'.

It would seem, then, that where the struggle between plant and plant is most bitter, a mixed association prevails, and that where the plant has to struggle chiefly against adverse conditions mass production results.

It was a rather stiff climb up the valley (Figs. 149 and 150), the path being rough, and in places very steep. Cattle go up, but cannot carry loads up the forest section. There was little in flower here, but I noticed a seventh 'Maddenii' Rhododendron—a small epiphytic shrub, of which I subsequently secured seeds, though I did not see the plant in flower (K.W. 7,606). A feature of this species was the shortness of the style—it was shorter than the capsule, instead of much longer, as usual in this section. *R. Edgeworthii*, with large, snow-white flowers and red calyx was another common epiphyte,

and a little higher up, *R. megeratum*, a pretty blonde, but rather diffuse in habit, was abundant. It is, perhaps, commoner on the cliffs than on the trees, and forms large bunches wherever water is constantly dripping, its brightly silvered leaves being not the least attractive part of it. A fourth epiphytic species, collected also in Tibet, was not seen in flower. *R. sino-vaccinioides* also flourished here at about 8,000 feet, and there were other shrubs besides Rhododendrons, chiefly Ericaceae though.

Late in the afternoon we emerged from the Magnolia-Rhododendron forest (the other big trees were chiefly species of *Quercus* and *Juniper*) into the first alpine meadow, where a very steep gully had torn open the flank of the mountain, and erupted an immense cone of rubble, causing an extensive hiatus in the forest. Part of the conquered ground really was meadow, and part

base where the five pocket-glands are situated. The under leaf-surface is a bright cinnamon-orange, the upper surface a dark matt green. Some specimens fairly spouted flowers, for besides being entirely smothered, scarlet pools of fallen corollas lay beneath. The species grows between 9,000 and 11,000 feet, but not higher, and the flower colour varies, being sometimes much paler—carmine or almost pink in extremes, but then the glands stand out as hectic, blood-red spots. It varies in size, too, from a good-sized bush eight or ten feet high to a scrubby plant. Vieing with it in colour, and differing chiefly in foliage is the scarlet 'Sanguineum' (K.W. 6,831), which forms extensive colonies of gnarled, dwarf bushes. It grew on the broken faces in long strips, and looked exactly like tongues of red-hot lava pouring down the mountain side.

FIG. 149.—VIEW LOOKING DOWN THE SEINGH KU VALLEY FROM ABOVE THE YAK CAMP, AT 10,000 FEET ALTITUDE.

of it was covered with a dense growth of shrubs and small trees, including several species of *Acer*, and *Salix*, *Hydrangea*, *Daphne*, *Rubus*, *Deutzia*, *Clematis*, *Tripterygium*, etc. Huge tongues and slabs of snow choked every gully and formed a solid bridge across the torrent. Rain fell in a steady drizzle, and we were wet, chilly and uncomfortable. However, there were some herd's huts here, and as it looked a promising field, and there were several gullies on either side, which I could climb easily, I decided to pitch my tent here and stay a few days before going into residence in my new hut, 1,000 feet higher up; besides, it was too cold to live comfortably much above 9,000 feet at this season of the year.

On the following day I had my first alpine climb, and despite the snow, found that many Rhododendrons and other flowers were blooming merrily.

One of the most splendid sights was the 'Haematodes' Rhododendron, K.W. 6,805, with trusses of six to ten drooping, bell-shaped flowers of deep glossy, blood-red, fluted at the

An interesting and extremely beautiful shrub is *R. tephropeplum* (K.W. 6,834), which clearly is identical with a species collected out of flower in Tibet (K.W. 6,303). The leaves are a curious smoky grey beneath and the lolling flowers, in loose trusses of four or five, are a delicate shade of rosy purple. The plant is by no means common in the Seinghku valley, small colonies of it being tucked away high up in two gullies, on opposite sides of the torrent, and on the high limestone ridge above my base camp. It demands deep shade, and probably requires a good deal of shelter, although it grows at 10,000 feet altitude.

The dowdy yellow *R. trichocladum* was also in flower, and so was a pinkish 'Thomsoni,' and the handsome 'Falconeri.' The last two are forest trees, quite forty feet high. The 'Thomsoni' has a characteristic smooth, tawny-bronze trunk, on which no alien plant can find purchase, and the flowers are in large, globular trusses. Inside the forest it assumes a curious angular habit, due to the whimsical way in which the trunk branches; and from

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, and April 9, 1927.

the lower limbs, the papery bark often hangs in weird rags and tatters. K.W. 5,732, from Tibet, would appear to be its nearest relative.

The large 'Falconeri' (K.W. 6,818) is quite a good plant, with brave trusses of flowers which open pale pink and gradually fade to white; at the base of the corolla is a purple flash. The leaves are rich cinnamon beneath, as in the Tibetan 'Falconeri' (K.W.).

Another good species here was a small tree 'Neriiflorum' (K.W. 6,854). The flowers are pale orange, rimmed and streaked with fiery-red, giving them a fine flame colour. It is a smooth-stemmed, narrow-leaved species, with ascending, never erect trunk, growing on the steepest rubble banks smothered up in thickets.

I was also delighted to discover in the elfin wood forest of these sheltered cliffs the big-leaved

it until October, when I gathered two capsules of seeds off it (K.W. 7,523).

So much for Rhododendron species—those of the 'Thomsoni' and 'Souliei' type being particularly abundant, and being in some respects peculiar, deserve a chapter to themselves.

The flanks of the valley were very steep, and so densely forested, or rather bush-clad, that it was quite impossible to ascend, except where a stream had carved a passage. These were all choked with snow, and so long as the snow lasted, it was easy to climb them; but after the snow had melted it became a matter of great difficulty on account of the huge boulders which blocked the way. Also, after the first two thousand feet, the gullies became precipitous. On the sheltered side of the

inside the tent, and almost impossible to keep one alight outside. Still, I was well satisfied with the place botanically, and in the course of ten days spent here I explored the neighbourhood thoroughly, cliffs, gullies, forest and meadow, of which there was not much. The minimum temperature fluctuated between 43° and 48°, while the maximum shade temperature never touched 70°. F. Kingdon Ward.

## NOTICES OF BOOKS.

### A New Monograph of Colchicum.

THE genus *Colchicum* is of sufficient importance in horticulture to warrant attention being called to an interesting new monograph recently published in Bulgaria by B. Stefanoff. The author takes a wide generic concept and includes in *Colchicum* both *Bulbocodium* and *Merendera*. Since the monograph is not likely to be generally available in this country, the following synopsis of the classification proposed for the sixty-four accepted species is given.

#### SUBGENUS 1.—ARCHICOLCHICUM.

Section 1. Luteae. Species: *C. luteum*, Baker; *C. regellii*, Stef. (comb. nov.); *C. hissaricum*, Stef. (comb. nov.); *C. robustum*, Stef. (comb. nov.).

Section 2. Bulbocodiae. Species: *C. szovitsii*, F.M.; *C. crocifolium*, Boiss.; *C. fasciculare*, Boiss.; *C. libanoticum*, Ehrenb.; *C. ritchii*, R.Br.; *C. schimperii*, Janka; *C. tauri*, Siehe; *C. serpentinum*, Woronow; *C. hydrophilum*, Siehe; *C. hirsutum*, Stef. (sp. nov.); *C. nivale*, Boiss. et Huet.; *C. biebersteinii*, Rouy; *C. davidovii*, Stef.; *C. catacauzenium*, Heldr.; *C. hungaricum*, Janka; *C. dorferi*, Hal.; *C. macedonicum*, Kousanin; *C. triphyllum*, Kze.; *C. kurdicum*, Stef. (comb. nov.); *C. caucasicum*, Spreng.; *C. soboliferum*, Stef. (comb. nov.); *C. atticum*, Sprun.; *C. jordanicum*, Stef. (comb. nov.); *C. sieheanum*, Hauskn.; *C. procurrens*, Baker.

Section 3. Vernae. Species: *C. vernum*, Ker-Gawl.

Section 4. Montanae. Species: *C. montanum*, L.

Section 5. Cupaniae. Species: *C. cupanii*, Guss.; *C. pauidi*, Heldr.; *C. boissieri*, Orph.; *C. pusillum*, Sieb.; *C. hiemale*, Freyn; *C. troodi*, Kotschy; *C. stevenii*, Kunth; *C. parlatoris*, Orph.

Section 6. Filifoliae. Species: *C. filifolium*, Stef. (comb. nov.).

Section 7. Arenariae. Species: *C. arenarium*, W.K.; *C. alpinum*, Lam. et D.C.

#### SUBGENUS 2.—EUCOLCHICUM.

Section 8. Autumnales. Species: *C. corsicum*, Baker; *C. micranthum*, Boiss.; *C. borisii*, Stef. (sp. nov.); *C. umbrosum*, Stev.; *C. laetum*, Stev.; *C. kotschy*, Boiss.; *C. decaisnei*, Boiss.; *C. neapolitanum*, Ten.; *C. longifolium*, Cast.; *C. kochii*, Parl.; *C. lingulatum*, Boiss. et Sprun.; *C. haynaldii*, Heuff.; *C. autumnale*, L.; *C. lusitanum*, Brot.; *C. tenorii*, Parl.; *C. levisi*, Janka; *C. visianii*, Parl.; *C. turcicum*, Janka; *C. variegatum*, L.; *C. latifolium*, S.S.; *C. speciosum*, Stev.; *C. bivonae*, Guss.

A Latin description, a full synonymy, and the complete known geographical distribution are given under each species. A brief account of the position of *Colchicum* in the Liliaceae, a fairly detailed synthetic description of the morphology, a useful key to the species, and an index are also provided. There are no illustrations but two maps show the distribution of the species.

In his short summary, Stefanoff discusses the evolution of the genus. The section *Eucolchicum* he believes to have originated from the more primitive species of *Archicolchicum* by a process for which he suggests the name *syngensis*. By this is intended development carried out throughout the whole geographical area, either by the appearance of local and some-

• B. Stefanoff: *Monographia na roda Colchicum*, L. in *Sborn. na Bulg. Akad. na Nauk.* xxii. 1926.

FIG. 150.—VEGETATION IN THE SEINGHKU VALLEY.

Big bushes of *Rhododendron Falconeri* and *R. Thomsoni* along the edge of the torrent, with Larch and Abies near them, at 9,000 to 10,000 feet elevation.

'Barbatum' (K.W. 6,855), identical with K.W. 6,302, from the Tsangpo Gorge. But again I had missed it in bloom. However, it had flowered here, which, apparently, it never had done in Tibet, and I got some seeds. The large size of the rounded leaves, with their long bristles, and the persistent leaf-bud scales, clothing the shoots for a number of years and giving them a curious senile appearance, heartily belied by the vigorous young leaf-shoots which squirt up in jets of coral-red and malachite green all over the tree in June, distinguished it.

On a wet and sheltered cliff, high up in the *Rhododendron* Fir forest, I found a few tufts of a very curious, purple-flowered species, which I called 'Purple Emperor' (K.W. 6,884). The flowers are solitary, and of a curious, sharp, funnel shape, and the leaves very narrow, but not aromatic. It was distinctly rare and confined, so far as my researches went, to one gully. With it grew a tiny 'Salweenense,' of which I found a solitary mat. It flowered later, but the snow bridge broke before that, and I was unable to cross the torrent and reach

valley a line of escarpments made climbing on that side hazardous, especially in a mist, and while scrambling in the forest, unable to see my way, I several times found myself trapped, surrounded by cliffs which at first sight offered no route either up or down.

A common and beautiful tree on these cliffs was *Viburnum Wardii*, with great corymbs of snow-white flowers and handsome rugose leaves which turn vivid colours in the autumn. It was only in the depths of the forest, however, and especially where gnarled trees clung to the cliff face, that this species flowered, and when I came to collect seed—the fruits are red to begin with and turn suddenly black—I found how few trees had borne flowers. Worse still, the birds had most of the fruit—it did not, as I believed, fall very easily, so it was probably birds which accounted for its disappearance. However, I collected some seed, though *Viburnum* is notoriously difficult to raise from seeds, which do not travel well.

Rain fell fairly steadily while we were in this camp, and sand flies made life hideous. Naturally, it was impossible to have a fire

## Only 11, yet she easily pushes this 16" Mower

Her father writes: "My little girl of 11 years very often helps me mow the lawn."

The PATENTED J.P. SUPER is so delightfully easy to handle, so silent and efficient in action that a child can be trusted to operate it. Its wonderful construction, its gears running in oil, its beautifully 'made-to-run-right' mechanism places it 'lawns ahead' of rivals.

**free.** Write to-day for fully Illustrated Booklet No. 69a.

Order one from any Ironmonger or Seedsman subject to test on your own lawn. You will be quite sure then that you have the best.

J.P. SUPER LAWNMOWERS, LTD.,  
69a, Maynell Road, Leicester.

Our Patented Power Mower is built to the J.P. Super standard—and so it is most economical in use. It does not go wrong. Ask for full particulars.

## RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

*Send for a copy to-day, to:*

times converging species, or by the production of vicarious species very often linked by gradual transitions. Unfortunately, the term *syngensis* has already been used in biology with quite another connotation, and the present writer has suggested that the hypothesis outlined above should be referred to as *hamagenesis*, a suggestion which Stefanoff has since accepted. There is a very close relationship between *hamagenesis* and Guppy's theory of differentiation. W. B. Turrill, Kew.

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONBURAS).

(Continued from p. 270.)

The Chucho is a small tree found in the larger islands, but nowhere in large quantities. Its wood is nearly black in colour, very hard and practically indestructible; the termites never attack it. At the cays of Bonacca some house posts of this wood were pointed out to me which have been standing there in the shallow sea water for over twenty years, without presenting the slightest sign of decay. The tree is also said to be found in the Cayman Islands, but it does not grow on the mainland of Central America.

The Physic nut or Piñon (*Jatropha Curcas*, L.) is a small tree of tropical American origin. It grows readily from cuttings, and is made use of as fence posts, as it has the advantage of being untouched by cattle or horses. Its fruit consists of four to six capsules each containing two or three Almond-like, oily seeds, about one inch (2½ cm.) in length. These seeds are used as a purgative, two or three of them making a dose. They act also as an emetic. No commercial use is made of these seeds, but from the Cape Verde Islands they are exported and the oil pressed out in Europe. The bark yields a yellowish milk which may be used to clean the teeth, having, furthermore, the property of calming toothache. The ignorant natives claim if a cut is made into this tree about noon on Good Friday, the bark will yield a blood-like liquid instead of the yellow one. This belief is also held by the Indians and Ladinos of the mainland.

The Arrowroot plant (*Maranta arundinacea*) known as Sagú and Yuquilla in the local Spanish, is cultivated in small quantities for the sake of the nutritious starch, an excellent food for children and invalids, which is obtained from the thin, long, whitish tubers. In certain parts of America, the root of this plant was applied by the Indians to wounds, in order to counteract the poison put on arrow tips, hence the name.

The Arrowroot is a small, herbaceous plant of tropical American origin; it reaches a height of two to three feet and produces a crop in less than two years from the date of planting. Its leaves are long, oval, somewhat lance-shaped, and of a hairy appearance, but there is also a smooth-leaved variety. It bears small, white flowers, which are followed by berries of the size of small Gooseberries; these flowers are sometimes picked off in order to improve the size and quality of the roots.

Considerable labour is connected with the making of the starch. First the root is washed and all the skin scraped off. It is then crushed, water added, and passed through a sieve in order to separate all the fibrous parts. The starch settles at the bottom and the water on the surface is poured out. The process of mixing the grated root with water and passing it through the sieve is repeated several times in order to produce clean, pure starch. After the last washing, all the water having been removed from the starch, the latter is dried in the sun for a couple of days, and finally stored in air-tight containers.

The Arnatto, Annatto, Achiote or Achote (*Bixa Orellana*, L.) is a small plant of tropical American origin that has cordate leaves and bunches of large, yellow flowers like those of a Rose. The outer covering of the seeds is fleshy and furnishes a red or yellowish-red colouring matter, which the Central Americans

use to colour foodstuffs and beverages (Rice, tamales, butter, etc.). The English-speaking natives use it for this purpose to a smaller extent. The Miskito or Mosquito Indians of the mainland do not condiment their food with Arnatto, but the females smear the dye on their faces in order to keep flies and other insects away.

Different kinds of Chilies or Red Peppers (*Capsicum* sp.) are cultivated in the Bay Islands, especially by the Ladinos. The larger, or "sweet" Chilies (*C. annuum*, L.), of which several varieties are grown, are eaten as vegetables. These are annual plants. There are also different, semi-wild-growing perennial shrubs (*C. frutescens* or *C. baccatum*), producing very small and exceedingly pungent fruits which are used in Chile sauce. Edouard Conzemiuss, 33, Boulevard des Batignolles, Paris.

(To be continued.)

## APIARY NOTES

THIS spring seems likely to add one more to the list of ungenial seasons of which England has so many. Up to the time these notes are being written the weather in the South of England has been such that on no single day has it been possible to open a hive. To talk of manipulation under such circumstances requires an act of faith. But the day will come when the bee-keeper will be able to examine his stocks and prepare them for the harvest. This preparation varies according to the character of the crop desired. For extracted honey it consists largely in allowing plenty of storage room. Some growers favour shallow frame supers, but the reason always seems obscure to me. A British Standard frame is not too large for extracting, and it has the immense advantage of being usable for either honey or brood; it may be placed anywhere in the hive. A shallow frame is of no use in the brood nest and can be used only in the super. Why then complicate one's work by using supers at all? Body boxes to the number required, piled one on top of the other, is the simplest and most efficient way.

If room is given before the hive gets crowded, and that room is ample, swarming should be a rare event. Many bee-keepers, however, think that ten standard combs are enough for the queen to use in breeding, whereas any good queen should be capable of making use of twice that number. So then, place a second body in position so soon as brood is found on six or seven frames, certainly when it is found on eight. Fill the second body with frames of foundation, but take two out from the centre. Put two frames of brood from the bottom body, with bees adhering, in their place; and the two frames of foundation, one on either side of the brood left in the bottom. In this way there will be brood in both bodies, and arranged in the shape of an inverted V. It is most important to keep the brood together, and never to separate it by putting foundation between frames and brood.

These remarks, elementary as they are, are prompted by the observations I have made, and am continually making, concerning the hives and equipment I see in the different apiaries I visit. Hardly ever do I find interchangeability. Yet every one of these operations demands it. Unless every body can be placed on every other body, every roof fit any body, floor boards made for use in any position, there can be no up-to-date management; and the bee-keeper is controlled by the bees, rather than the bees by him.

Standardisation, in the sense used by Dr. Phillips, of Cornell University, in this month's issue of *The Bee World* is not necessary nor even desirable. That every bee-keeper should use the same type of hive frame and section would be a mistake. Let every bee-keeper find out for himself which size of hive suits his particular district; but, after that, let him see to it that he never introduces another, and if, in error, he has already made that mistake, let him begin standardisation in his own place, weeding out all misfits, and gradually getting together a

sufficient stock all of one pattern. In the south, I find that M.D. body boxes holding ten frames are suitable for sections, and British Standard hives holding twelve frames are suitable for extracted honey. Of the latter, three body boxes are allowed to each stock, and for the former, four crates of thirty-six sections to place above one M.D. hive. In a poor season like last year these are not all required, but in a really good season they are.

If the M.D. frame is not in use for sections, then allow two body boxes of B.S. frames to each stock until the honey flow, and then reduce to one, and pile up supers.

A word of warning may be given in conclusion. Now is the time to watch minutely for American foul brood. No disease is so terrible. If any sunken cappings are observed, any cells the eggs in which are not hatching out normally, or any larvae discoloured, take immediate steps to have a close examination made by a microscopist. Treatment is possible, if the disease is diagnosed early and prompt attention given, but once neglected it will spread through an apiary, and through whole districts like a bush fire. Shaking, starving for three days, burning all combs, and scorching of all fittings and hives, then placing the bees on foundation, will generally clear out the disease, but nothing less will suffice. To do this at the beginning of a honey flow is best, for the bees can build out combs quickly, rear a fresh and healthy brood nest, and gather enough stores for winter, and sometimes even a surplus. Moreover, there is then less danger of robbing. We are told the disease is spread more by robbing than in any other way. Indeed, it is owing to robbers that such difficulty is experienced in keeping apiaries free of the scourge, for in honey from a diseased stock there are millions of spores, any one of which can set up the disease in a healthy stock. Unlike Isle of Wight disease, it is a larval complaint, although the spores have been found by Cheshire in the ovaries of a queen. Whether adult bees can carry it therefore, apart from honey they have robbed, is an enquiry still waiting the investigator, but we do know the spores are carried by adult bees in honey from a diseased colony.

Therefore, it is well to shake before a honey flow, when there is a minimum of honey in the hive, but when new honey will be available to the bees immediately the starving treatment is at an end and the new combs have to be built. J. Marie.

## EFFECT OF SHADE ON APPLE SCAB.

FOR the last two seasons I have made observations on the existence of Apple Scab, which seem to afford evidence that trees receiving considerable shade during part of the day produce fruits very much freer from scab than do fully exposed trees. The varieties which suffer most with me are Lord Derby and Newton Wonder. In a row of the former an end tree is growing under the shelter of some big Larch trees. It receives shade from 2 p.m. until near sunset. The tree has suffered from competition with the Larch, for it is much smaller in size than others in the row. It, however, bears very well, and always good, clean fruits in great contrast, in this respect, to the rest of the row. By the north side of a big shed I have another tree of Lord Derby. It receives shade from the shed and other trees for a considerable part of the day. It is a splendid bearer of fine, big, clean Apples. Another Lord Derby on the other side of the shed, and receiving full sun, produces a very scabby lot of fruits every year.

A neighbour grows some very fine, clean fruits of Lord Derby on trees that are completely cut off from bright light on the south side by a hedge as high as the trees.

I always pick my best and cleanest specimens of Newton Wonder from a row of low bush trees, shaded on the west by other Apples, and on the east by Raspberry canes that grow as high as the Apples. Other fruits of Newton Wonder in exposed parts are, unfortunately, always affected by scab.

Of course, I shall be told that there is nothing

in my suggestion, and that, on the contrary, shaded trees, by remaining wet for longer periods, will be more likely to give scabbed fruits. I can only reply that I have stated facts, and that there is, at any rate, an analogous position with regard to Coffee Leaf Disease. The spores of this fungus are said to germinate only in a film of water on a leaf. Therefore, one would suppose that trees exposed to full sun would be most free of this disease. Yet in more than one Coffee-growing country shade is planted over the Coffee, as it is said to escape disease best when shaded.

I have made experiments in shading fruit and fruiting branches, but with no result. It seems clear that if shade is beneficial in this respect, it is only by its effect on the growing tree, and not on the fruit itself. Were it otherwise, one would find clean fruit on every tree in positions where it was protected.

I shall continue my observations and write these notes in the hope that others of your readers may be induced to do likewise and report their conclusions. *E. Brown, Hillside, Duddington, Sittingbourne, Kent.*

## VEGETABLE GARDEN.

### BEEF.

This useful salad plant succeeds best in a somewhat light soil, and in common with most other root crops, should not be grown on freshly-manured land. Early sowings may be made in the open towards the end of March or early in April, but only a limited quantity is necessary to supply young, partially-developed roots for mid-summer requirements. Sow in rows made twelve to fifteen inches apart, and thin the seedlings in the first instance to three inches, and later remove alternate plants in the rows so soon as they are large enough for use. Large, coarse roots often result from sowing too early, therefore the maincrop should not be sown until about the first fortnight in May, according to the locality. Sow in rows made fifteen to eighteen inches apart, and when thinning, adopt the same plan as advocated for the earlier sowings, but allow a little more space between the plants.

Beet-root transplants fairly well under favourable weather conditions, and, fortunately, the crop is not subject to any serious pest or disease.

Varieties vary considerably in the amount of leaves they make, and in some instances this is very large in proportion to the root.

There are three main types, namely, Round, Intermediate and Long.

The type grown will depend on the nature of the soil, the requirements of the establishment, and the season of sowing. The round varieties are earlier in maturing and best adapted for uncoongenial soil.

Good representatives of the round type are Crimson Globe and Egyptian, these being suitable for both early and late sowing. The Intermediate type is not in great favour, but when desired, Feltham Intermediate may be recommended.

There are many splendid varieties of the long type, such as Cheltenham Green-Leaf, Dell's Crimson-leaved and Northumberland. These are excellent garden Beet in that they make nice, clean roots with good coloured flesh, and not a large amount of foliage.

Towards the end of October the roots of the maincrop will be ready for lifting, and care should be exercised in handling them to prevent bruising them. No trimming should be attempted beyond twisting off the leaves a little above the crown. The roots should be stored in sand in a cool shed or in clamps. On well-drained soils in the south, a sowing of a round variety made at the end of June or early in July will furnish roots of a medium size by the end of October, and these will be superior to the larger roots of the maincrop for spring supplies. Lift and store them in the ordinary way, or, if desired, allow them to remain in the ground, but protect them during times of severe frosts with dried Bracken, Fern or similar material. Where the demand exists, Beet may be sown in slight warmth in February but, being a plant that is not very amenable to forcing, it requires much care to

produce a satisfactory crop under glass. Better results may be obtained by making a sowing in a cold frame early in March, dispensing with the frames later in the season. *J. Wilson, Wisley.*

### TOMATO ESSEX WONDER.

This variety may be highly recommended for outdoor culture, for it is a sturdy grower, sets its fruits freely, and is a prolific cropper. The foliage is clean-looking and healthy, the fruits of good colour, shape and flavour, and fruiting plants are an acquisition to any garden. It is also harder than most varieties, doing well in the open garden, and ripening its fruits early. *R. Gardner.*

### SOME UNCOMMON VEGETABLES WORTH GROWING.

(Concluded from p. 290.)

**SALSIFY** (*Tragopogon porrifolius*) is sown in the open at the end of March or early in April, in drills made one inch deep and twelve inches apart. This crop does best in good, deeply-dug, sandy loam, with a liberal layer of manure from twelve inches to fifteen inches below the surface. Thin the plants to five inches asunder so soon as they are large enough to handle, and hoe the surface soil regularly during the summer. The roots are fit for use in October, and it is usual to lift and store a portion of the crop in sand during November, the remainder being left in the ground to be dug as required. If treated like Chicory, the blanched foliage makes a useful salading. The roots are delicious if properly cooked and served with butter.

**Scorzonera** (*Scorzonera hispanica*) is not much grown in this country, but is prized on the continent and might well be introduced, as a novelty, into more English gardens. The main point in the cultivation of this crop is to obtain large, clean roots. To grow good roots, trench a piece of ground and mix a liberal amount of half-rotted manure in the bottom spit, taking care that there is none in the top spit. Early in April prepare the surface as a seed-bed, and sow the seeds in shallow drills made fifteen inches apart, three or four to a patch, putting each patch about a foot apart in the drill. Keep the crop clean and it will be fit for use in September. Lift the roots as required, in the same manner as Parsnips.

If desired, a second sowing may be made in May. To cook the roots properly they should first be scalded, then scraped and thrown into water containing a few drops of Lemon juice, allowing them to remain in the water for half-an-hour. Boil them in salted water, in the same manner as Carrots, until they are quite tender, and serve with white sauce. If left to get cold, they may then be sliced and fried in butter.

**Seakale Spinach**, or **Silver Beet** (*Beta Cicla*), is easily grown, long lasting, and extremely hardy. It may be had in every month of the year, except during the dormant season—January to March. The large, fleshy leaves contain a very marked, white midrib. This midrib, when stripped of the green part, is boiled separately and served like Seakale, on toasted bread, with white sauce over all. The Seakale flavour is not so pronounced as in the case of *Couve Tronchuda*, but is much more delicate. Some people prize it very highly as a delicacy. The green part, stripped from the midribs, may be boiled and used exactly like true Spinach (*Spinacea oleracea*), but has a slightly stronger flavour, inasmuch as it contains a greater percentage of iron. It is delicious when boiled, like Cabbage, in bacon-water.

Seeds may be sown in the open at any time from the end of March to the end of July; plants from a March-sowing produce edible leaves from June to July, while July-sown seeds will give edible plants in the following April.

Seedlings are easy to transplant if they are well watered for some few days after transplanting; transplanted seedlings, in fact, give better results than seedlings not so dealt with. *Beta-Cicla* may be grown even in a cold Peach-house, or vinery, by sowing in drills (like Spinach) so late as September, to produce

young stock for planting out early in April, for consumption early in June.

A simple and effective way of growing Sweet Corn or Sugar Corn (*Zea Mays*) is to prepare a deep, rich bed in a sheltered and sunny situation; late in April or early in May, dibble in the seeds two inches deep, in rows made two feet asunder, and twelve inches apart in the rows; when the plants have reached a height of say, six inches, remove every second one. The cobs, or heads, should be gathered just when passing out of the milky state, round about August to September, and should be steamed for fifteen minutes. Steaming is much to be preferred to boiling.

**Witloof** or **Brussels Chicory** (*Cichorium Intybus*) is a great delicacy within the reach of all, even of those who possess only a very small garden. Sow the seeds in June in much the same way as Lettuce seeds, and treat the plants similarly to Lettuces. Early in November lift the roots, choose the best, shorten them to eight inches or ten inches, and trim off the leaves to within two inches of the crown. Then open a trench about eighteen inches deep, in which stand the roots upright, about two inches apart. Fill the trench with good, light, sifted soil, and cover whatever portion is required to be forced with from two feet to two-and-a-half feet of stable litter. Heat is soon generated from the dung and in about three weeks, blanched heads, resembling small Cos Lettuces, will be available to be eaten either as a salad or cooked and served in the same way as Seakale. *Captain E. A. Saunders, Havant, Hampshire.*

## NURSERY NOTES.

### LONGFIELD HOUSE NURSERY.

The Longfield House Nursery of Messrs. E. Stevens, Ltd., is one of the several extensive establishments in Cheshunt where Roses are grown on a very large scale for the production of flowers for market.

A visitor to such a nursery, not knowing what to expect, will be disappointed; when told that twenty-four acres of Roses under glass are to be seen, he would probably expect to find a gorgeous display of long-stemmed blooms. Such expectations would, however, not be fulfilled, for the flowers are cut almost so soon as they show colour and placed in water in the packing shed, there to await the attention of the packers before being dispatched to the various flower markets—London, Manchester, Paris.

Sometimes so many as two-thousand dozen blooms are dispatched in one day, but these numbers have been exceeded on occasion, although naturally the quantity varies with the seasons, and there are only small consignments during the dull months of the year when, however, high prices are obtained. At Longfield House all the Roses are planted out in large houses, and there is usually a pathway after each fifth row of plants, thus enabling the work of disbudding and general cultivation to be performed with ease. In round figures, 120,000 Roses are grafted each year for the purpose of maintaining vigorous, healthy stock for planting new and replanting old houses. The writer was somewhat amazed to find large numbers of old plants of Madame Abel Chatenay still vigorous and obviously economically useful, notwithstanding twelve years of almost continuous cropping.

Cultivation is reduced to a fine art and by a system of pruning, resting and feeding, no fewer than four crops of Rose blooms are obtained annually from established plants. Every plant is in the rudest health, and nowhere in this great acreage could a sign of mildew or other disease, or insect pest, be seen. Spraying and fumigating are items in the regular system of cultivation that places prevention before cure.

The soil at Longfield House is fairly heavy, a kind of brick earth, and is particularly suitable for Roses grown on such intensive methods; indeed, the renewal of the soil is seldom necessary. Cultivation extends to a depth of about eighteen inches, and half-decayed stable manure adds the necessary humus, this material being used for

top-dressing both the new and the old plantations. Watering is done by means of a hose attached to convenient stand pipes and the water is provided by wells sunk 400 feet deep into the chalk below, and pumped up by a powerful, compressed-air engine to a huge, elevated tank, whence there is sufficient pressure for the service of the houses. Heating is by hot water, as Mr. Ernest Stevens is not enamoured of steam heating.

Roses grown in quantity at Longfield House are Ophelia, Golden Ophelia, Madame Butterfly, Liberty, Richmond, Premier, Madame Abel Chatenay, Molly Sharman Crawford and Rose-landia, but the last-named variety is the one least grown. In addition, a few dozen varieties are being tested, otherwise the crops are limited to the varieties named.

Only one other subject is grown at Longfield House, i.e., Tomatos, and of these there are about five acres under glass, and in the earliest houses the exceptionally clean and healthy plants are now commencing to ripen their earliest fruits.

The establishment of Messrs. Ernest Stevens, Ltd., is a self-contained one; all the building, painting, glazing, etc., is done by a group of skilled workmen who are always busy, as scarcely a year passes without the erection of a new block of houses. The whole staff consists of about 160 persons. They constitute a happy family, in which Mr. Ernest Stevens and Mr. Dore take a kindly and personal interest.

A sports ground is provided on the estate and is large enough for two football pitches and two cricket grounds, in addition to bowling greens and tennis courts. The Athletic Club at Longfield House is a great institution, and on August Bank Holiday, when a sports carnival is organised, so many as 5,000 people have attended. This interest in the social life of the staff has its reflex action, as every member is proud of his association with Messrs. Ernest Stevens, Ltd., and that pride is demonstrated in the extreme cleanliness, tidiness and smartness seen throughout the whole establishment.

## HOME CORRESPONDENCE.

**The Temperate House, Kew.**—Visitors to Kew will be surprised at a recent alteration in the Temperate House. An octagonal bed has been formed in the centre near the north entrance thus blocking up the grand vista, over six hundred feet in length, that was previously one of the finest sights at Kew. Why this senseless alteration has been made it is impossible to imagine; it cannot be for the requirements of the plants as they grew well previously, and it is entirely opposed to the convenience of the public, while from a picturesque point of view it is decidedly wrong. Why has the alteration been made, and who is responsible for it? *W. H. Divers, V.M.H.*

**The Old Blue Polyanthus.**—In your issue of April 2 there is a reference to an old blue Polyanthus grown many years ago in the Strathearn district and now extinct there. Your contributor suggests that this may have been *Primula elatior coerulea* or *P. amoena* (Bieb.). Is it not possible that it was the China Blue silver-laced Polyanthus, a variety which has now become very scarce and is little known? I know nothing whatever about its origin, but it is certainly a garden-raised variety and not a wild form. I know that it was grown in an Aberdeenshire garden about 1878, and even then was regarded as a very rare and old-fashioned variety, worthy of every care in its cultivation. I do not think it is obtainable from any nurseryman at present, but I have been fortunate in getting two healthy plants through a lady in Ireland, after a long search. All the more modern blue Polyanthuses which I have seen are wholly blue, like the blue Primroses, but this old variety has the silver lacing beautifully defined, and must have been a great favourite with the enthusiastic florists in its time. The shade of blue is much paler than in blue Primroses—China blue well describes it. Is it possible that this variety was one of the ancestors of

the Wisley Blue Primrose? *P. amoena* seems to have been difficult to keep, and is not in cultivation now. Was it ever grown by Mr. G. F. Wilson? It would be very interesting to learn how the old blue Polyanthus obtained its colouring. *Norman G. Hadden, West Porlock, Somerset.*

**Deep Trenching.**—I am thoroughly in accordance with Mr. Beckett and Mr. Streeter that deep trenching is essential in the production of good, clean vegetables of superb quality, both for the table and for exhibition. The honours and fame that Mr. Beckett has achieved for the past forty years at Aldenham on some of the worst ground I know in England goes to prove his contention. Such results as he has to his credit could only be obtained by trenching, supplemented by suitable materials, such as leaf-mould and refuse from frames, old Mushroom-beds and the like. The fullest benefits of deep trenching must not be expected to be obtained in the first twelve months. I notice Mr. Streeter advocates adding sand, but I do not wholly agree with him on that point, as there are no feeding properties, or very little else of use to plants in sand. *A. T.*

[Sand improves the texture of heavy ground.—Eds.]

**Onions.**—In his article on "Onions," (p. 254), I am glad to see Mr. J. Wilson admit that Ailsa Craig, Cranston's Excelsior and Premier are all of a similar type; but why are all three names necessary for one variety? I never found a dusting of soot alone prevent the Onion fly from depositing her eggs on the young Onions in districts where it is troublesome, although if two or three handfuls of air-slaked lime are mixed with the soot it will keep them away, but the dressing must be renewed after rain. I took charge of a garden where the soil was very peaty, and in which I was told it was impossible to grow Onions owing to attacks of maggots. When sowing time came the ground was so wet I thought the seed would never germinate, and, to facilitate germination and prevent the seed from rotting, I filled the drills after sowing the seed, with sand obtained from a lake on the estate. The sand was of a bright red colour and sharp. That season I never saw a single Onion attacked by the maggot, but in subsequent years when I did not use sand, I lost, on an average, half the spring-sown crop. I did not at first attribute the immunity from maggots to the sand, but after repeated trials, I had to do so. I have never since had to deal with a garden where Onion fly was troublesome enough to test whether any other kind of sand would be equally effective. Sand is a simple remedy and easily obtained, but whether there were special properties present in the sand I used, could only be discovered by analysis. *Grigor Roy, Stoke D'Abernon Manor Gardens, Cobham, Surrey.*

## PUBLIC PARKS AND GARDENS.

BRIDGWATER Town Council has decided to spend £1,250 on laying-out Eastover Park.

EPSOM Rural District Council has under consideration the question of the lay-out of the Brewery Meadow, Cobham, as a recreation ground.

STONE (Staffs.) Urban District Council has applied for sanction to borrow £750, the estimated cost of laying-out the recreation ground.

THE Rochester Corporation has purchased land fronting Goddington Road, Strood, for a recreation ground.

WINDERMERE Urban District Council has under consideration the acquisition of thirty-three acres of land on Windermere foreshore at Bowness Bay for an extension of the public park. The purchase price is stated to be £9,900.

## SOCIETIES.

### NATIONAL ROSE.

APRIL 22.—While in extent of exhibits the Spring Rose Show fell somewhat short of expectations, the quality of the competitive exhibits was fully equal to that of its predecessors. Princess Mary, Viscountess Lascelles, paid an early visit to the show and was received by Mr. Arthur Johnson, the Vice-President of the Society, under whose guidance and attended by Mrs. Johnson, Miss Willmott and Mr. and Mrs. Courtney Page, Her Royal Highness made a prolonged and critical inspection of the show. As usual, the arrangements were admirable, and it was found possible to open the doors before the advertised time, greatly to the convenience of the large number of visitors who were awaiting admission. Although considerable numbers of new seedling Roses were submitted for award very few were of outstanding merit, and only a Gold Medal was awarded. These new Roses included several which had previously received the Society's Certificate of Merit, but with the exception of the Gold Medal variety they were not impressive.

### GOLD MEDAL.

*Charles P. Kilham.*—This H.T. variety (Fig. 145) received a Certificate of Merit at the Autumn Show last year, when it was seen at rather better advantage. On the present occasion the foliage, though ample, was thin in texture and numbers of petals lacked colour, giving the appearance of early fading. But both conditions were probably due to hard forcing in order to have the blooms open for the show. But in spite of this the flowers were bright and attractive. The buds are long and pointed and the mature blooms are of perfect shape. The colour is elusive, but generally may be described as dull flame, or orange-scarlet flushed with salmon. The stems are long, and the variety appears to possess plenty of vigour. Shown by Messrs. GEORGE BECKWITH AND SON.

### OTHER NOVELTIES.

Two very attractive dwarf Polyantha Roses were shown by Messrs. CHAPLIN BROS. *Susanne Miller* bore plenty of trusses of small, semi-double, pink flowers, while *Scarlet Leader* had rather large flowers of the same type but of bright scarlet colouring. Although not submitted for award, *Golden Salmon*, another dwarf Polyantha, which was included in several trade collections, was exceedingly effective. It bears shapely trusses of bright orange-salmon flowers, and is of free habit. *Diana Cant*, shown by Messrs. B. R. CANT AND SONS, is a showy H.T. variety which opens rosy scarlet, but fades to a light pink at maturity. *Margaret Spaul*, another novelty shown by Messrs. B. R. CANT AND SONS, is a very large, solid H.T. of creamy colour flushed with dull pink. *Deamond Johnston*, a novelty from Messrs. S. MCGREDY AND SON, is a very pretty rose-pink and gold H.T. which appears to be of distinct garden value.

### GROUPS OF ROSES.

As usual, the large trade groups of Roses were exceedingly effective, and they attracted and held the admiration of Rose lovers throughout the day. Although there was only one circular group of pot Roses, it was especially effective, and Messrs. CHAPLIN BROS. were deservedly awarded the first prize. From a groundwork of profusely flowered, dwarf Polyantha varieties, such as *Golden Salmon*, *Susanne Miller*, *Superba* and *Ellen Poulsen*, there rose standards of *Dean Hole*, *Mrs. Henry Bowles*, *Margaret Horton*, *Rev. F. Page Roberts*, *J. G. Glassford* and similar varieties which, in turn, were surmounted by taller plants of pillar Roses, principally *Excelsa*, *White Dorothy* and *American Pillar*. Messrs. CHAPLIN BROS. were also the only exhibitors of six Pillar Roses in pots, but, while they were awarded the first prize this exhibit did not reach the same high standard as their large circular group.

Keen competition resulted in the class for a group of cut Roses arranged on the staging, in which Mr. ELISHA J. HICKS was an easy first.

He had a particularly handsome group composed of profuse pillars of *Maréchal Niel*, Climbing Lady Hillingdon, Madame Butterfly, Lady Reading, Coral Cluster and Paul's Scarlet Climber rising above generous stands and vases of America, Angeie Pernet, Souvenir de Claudius Pernet, Mrs. George Norwood, Chas. E. Shea and other good garden Roses. Messrs. B. R. CANT AND SONS were second, and they had vases of Padre, Lady Wakefield, Mrs. Beatty, Golden Ophelia and Madame Butterfly in a fresh collection. Shot Silk, Padre, Souvenir de Claudius Pernet and Angeie Pernet were well shown in Mr. GEORGE PRINCE'S third prize group.

Although there were only two exhibits of twenty-four exhibition Roses in not fewer than eighteen varieties, they were of very good quality. Messrs. B. R. CANT AND SONS were first, with an admirable collection of blooms which would have been worthy of favourable comment at a June show. Their collection included specimens of Mrs. Beatty, Marjorie Bulkeley, Margaret M. Wylie, Covent Garden, Mrs. Henry Morse and Bessie Chaplin. In his second prize exhibit, Mr. ELISHA J. HICKS staged really good blooms of Mrs. Edward Mawley, White Maman Cochet, Mrs. Elisha J. Hicks and H. V. Machin.

With blooms of *Maréchal Niel* of the high quality expected from him, Mr. A. T. GOODWIN won the first prize for twelve blooms of any one variety. Messrs. B. R. CANT AND SONS were second with a dozen delightful specimens of Mrs. Beatty, which, in addition to beautiful colour, were pleasantly scented. Mr. GEORGE PRINCE was third with a board of Mrs. Foley Hobbs which included the best bloom in the trade classes.

The baskets of Roses were not so numerous as at some former spring shows. Mr. A. T. GOODWIN was awarded the first prize for two baskets; one filled with his wonderful *Maréchal Niel* Roses and the other with equally good blooms of *Frau Karl Druschki*. Messrs. CHAPLIN BROS were awarded the first prize for a fine basket of unusually large blooms of Madame Butterfly. The first prize for a basket of one or more varieties was won by Mr. A. T. GOODWIN with his incomparable blooms of *Maréchal Niel*, while Messrs. B. R. CANT AND SONS were second with an attractive basket of mixed varieties.

#### AMATEURS' ROSES.

While the number of exhibitors in the Amateurs' classes were fewer than could have been wished, the quality of their blooms was all that could be desired, for it reached a high standard of excellence. The four groups of Roses arranged on the staging were well worthy of the great admiration they received. Mr. E. J. HOLLAND, Sutton, was first, and he included splendid vases of Mrs. C. Lamplough, Dean Hole, Madame Butterfly, Caroline Testout and Lord Lambourne. While the value of the second prize group of Mr. G. A. HAMMOND, Burgess Hill, was somewhat discounted by the absence of labels, the quality was very good, and his central vase of Mrs. Foley Hobbs was especially meritorious. Mr. J. N. HART, Potters Bar, the third prize winner, had an admirable basket of *Maréchal Niel*. Mr. HOLLAND also showed the best twelve exhibition Roses, and included almost perfect examples of Louise Crette, Mrs. Campbell Hall, Mrs. C. Lamplough and Dame Edith Helen. Mr. SYDNEY F. JACKSON, Epsom, was a good second, and his admirable collection contained, in a beautiful specimen of Mrs. Foley Hobbs, the best bloom in the Amateurs' classes. He also showed very good blooms of Wm. Shean, Augustus Hartmann and Frances Gaunt.

Mr. J. N. HART won first prizes with six blooms, in not fewer than three varieties and with very good specimens of Mrs. Foley Hobbs, for six blooms of any one variety. The best six blooms, open to growers of fewer than thirty pot Roses, were shown by Mr. F. W. ELCOCK, Carshalton, who included meritorious examples of Bessie Chaplin and Mrs. Foley Hobbs. Mr. SYDNEY F. JACKSON won first prize with six admirable vases of mixed varieties and with a fine basket of *Maréchal Niel*, in which class Mr. E. J. HOLLAND was a good second with Mrs. Foley Hobbs. Mr. N. OPPENHEIMER,

Caterham Valley, and Mrs. COURTNEY PAGE, Enfield, won first prizes for baskets of mixed Roses.

#### ARTISTIC CLASSES.

The Dinner Table and other artistic classes were all well filled. In the open classes, Mrs. TISDALL, making artistic use of Roselandia and Maple foliage, was first in both the Dinner Table and the Bowl classes, and Mrs. L. R. MAY won both second prizes. In the Amateurs' classes, Mrs. COURTNEY PAGE, Enfield, added to her many successes by winning the first prizes for a delightful Dinner Table decoration of Roselandia, Maidenhair Fern and other foliage, and for a bowl of mixed varieties. Mrs. F. CHARLTON, Yiewsley, was second, and Miss M. WOOLVEN, East Grinstead, was third in the Dinner Table class. Mrs. A. D. RUFF, who used Roselandia effectively, was first in the class for a vase of Roses.

#### MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Thursday, April 7, the members of Committee present were Messrs. J. B. Adamson (in the chair), R. Ashworth, Hy. Astley Bell, A. Burns, A. Coningsby, J. Cypher, J. Evans, A. Keeling, J. Lupton, D. McLeod and H. Arthur (Secretary). Mr. B. Collins was invited to sit with the Committee.

#### FIRST CLASS CERTIFICATE.

*Odontoglossum plumbtonense* var. *Lilacinum*.—A magnificent, round flower, over three inches across, of solid lilac colour, with white tips to the segments; large, flat lip with white base and yellow crest. From Mr. JOHN EVANS.

#### AWARDS OF MERIT.

*Odontioda Marigold* var. *Radiata*; *O. Thyone*, *O. Theresa* var. *Lilacina*; *Odontoglossum West Point Monarch* var. *coruleum*, *O. Purple Queen*; *Cypripedium Conference* var. *Golden Glory*; and *Dendrobium Magda* var. *magnifica*. From J. B. ADAMSON, Esq.

*Dendrobium Tinsbury Gem* var. *Redstart*; *Cypripedium Helsa* var. *Ingrid* (Helen II × *Satyr*); *Brasso-Laelio-Cattleya Philomela* (L.C. G. S. Ball × B.C. Apollo); and *Cypripedium The God Pan* var. *Daphnis*.—From Mrs. BRUCE and Miss WRIGLEY.

*Miltonia Venus* var. *Princess Maud*; *Brasso-Cattleya Rivalto*; *B.-C. Empress of Russia* var. *Delicata*; and *Odontioda Victory*.—From G. V. LLEWELYN, Esq.

*Odontioda aureum* (Odm. *Lambeaunium* × *Odta. Coronation*); and *Odontoglossum crispum*, *White Perfection*.—From Col. Sir J. RUTHERFORD, Bart.

*Brasso-Cattleya Bianca*, *The Warren* var., and *Odontoglossum Red Admiral*, *Vestey's* var.—From the Hon. G. E. VESTEY.

*Dendrobium Merlin* var. *Brilliant*.—From Capt. W. HORRIDGE.

*Odontoglossum James Wood Draper* (parentage unknown).—From JAMES WOOD, Esq.

#### AWARDS OF APPRECIATION. FIRST CLASS.

*Dendrobium Enxinel* (nobile virginalis × *crepidatum*), *D. Phyllida* (Ainsworthii × *Snowball*), and *D. Bembo* (Euryalus × *melanodiscus*).—From Capt. W. HORRIDGE.

*Cypripedium Llewelynii* (Mulath × *Druryi*). From G. V. LLEWELYN, Esq.

#### CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Angraecum Sanderianum* and *Dendrobium nobile album*; and to Mr. A. BURNS for *Lycaste Hagha*.

#### GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded; *Dendrobiums* included *D. nobile*, *album*, *D. Cooksonii*, *D. Harefield Hall*, *D. Thwaitesiae* and *D. melanodiscus*; and *Odontiodas* were represented by *O. Thyone*, *O. Theresa* var. *Lilacina*, *O. Marigold* var. *Radiata*, *O. Madeline Evansiae* and *O. Glenora*.

Mrs. BRUCE and Miss WRIGLEY (gr. Mr. A.

Burns), were awarded a Large Silver Medal for a group of *Dendrobiums* of the nobile section, with *D. Thwaitesiae*, *Veitch's* var., *D. Rolfeae*, *D. Apollo* *album*; *D. chassingtonense aurosum*, *D. plumbtonense* var. *Alastair*, and *D. Wardianum*; *Lycastes*, *Coelogyne Sanderiana*, and *Cypripediums* in variety were also shown.

The Hon. G. E. VESTEY, Southport (gr. Mr. B. Collins), was also awarded a Large Silver Medal for a group in which were *Odontoglossum Red Admiral*, *Vestey's* var. *O. Marcus*, *O. Phena*, *O. Hyeana*, *O. Harold* and *O. Martius*, in addition to *Cattleya Cowanii alba*, *Brasso-Cattleya Bianca*, *Miltonia Hyeana* and *Cymbidiums* in variety.

G. V. LLEWELYN, Esq., Southport, was awarded a Silver Medal for a group of *Cypripediums*, *Miltonias*, *Brasso-Cattleya Empress of Russia* var. *Delicata* and *B.-C. Rivalto*.

Capt. W. HORRIDGE, Bury (gr. Mr. A. Coningsby), staged *Dendrobium Euxine*, *D. Phyllida*, *D. Bembo* and *D. Merlin* var. *Brilliant*. Col. Sir J. RUTHERFORD, Bart., Blackburn (gr. Mr. J. Lupton), showed *Odontoglossum crispum* var. *White Perfection* and *O. Paulin*.

JAMES WOOD, Esq., Bathgate (gr. Mr. J. Wilkes), sent *Odontoglossums*.

Messrs. J. CYPHER AND SONS staged a group to which a Silver Medal was awarded. This included *Cypripedium Pyramus*, *C. Maudiae* and *C. Miss Louisa Fowler*; *Renanthera Imschootiana*, *Cirrhopetalum Collettii*, *Lycaste Balliae*, *Masdevallia Houtteana*, *Siphonotis grandiflora*, *Miltonia Blueana*, *Burlingtonia fragrans* and *Cymbidiums*. Messrs. KEELING AND SONS, Bradford, showed *Cypripediums* and *Odontiodas*, and Mr. JOHN EVANS and Mr. D. McLEOD showed *Odontoglossums*.

#### READING AND DISTRICT GARDENERS'.

THE fortnightly meeting, held in the Abbey Hall, on April 11, was well attended and presided over by Mr. J. R. Lloyd.

The final meeting of the spring session is known as "Hospital Night," and on this occasion there was a magnificent display of cut flowers and flowering plants staged for the purpose of being sent to the Royal Berkshire Hospital afterwards. The display included *Daffodils* in numerous varieties, *Arum Lilies*, *Polyanthuses*, *Cinerarias*, *Tulips*, *Anemones* and flowering shrubs, contributed by Messrs. APPLETON, BEAUMONT, BROOMFIELD, BROWN, CLARK, J. COX, DOW, FULKER, GOWER, GREEN, F. HAINES, HOWLETT, JAMES, JENNINGS, KENDALL, KITT, LANGFORD, MOULTON, PACKER, RABBITTS, REEVES, SHORT, R. G. TAYLOR, TOWNSEND, F. TURNER, WADE, WAITE, WEBB, H. WYNN and J. WYNN. A collection taken in aid of the Hospital will enable the Association to send a donation of three guineas.

In the competition for *Daffodils* there was a splendid entry, and lovely blooms were shown by each exhibitor. The awards were as follow:

Three vases, three distinct varieties, five entries; first, Mr. H. BROOMFIELD, The Gardens, Clyffe House, Mapledurham; second, Mr. F. TOWNSEND, The Gardens, Hillside, Reading; third, Mr. A. W. GOWER, The Gardens, Calcot Grange.

One vase, mixed, eighteen blooms, ten entries:—First, Mr. C. J. HOWLETT, The Yews, Earley; second, Mr. H. WADE, The Gardens, Mortimer House; third, Mr. F. HAINES, The Gardens, Calcot Hange.

There was also a competition for three plants of *Polyanthus*s, and the first prize was awarded to Mr. A. H. DOW, The Gardens, Calcot Park; second, to Mr. T. F. PACKER, Collis Road, Reading; and third, to Mr. T. C. WAITE, Verona, Basingstoke Road, Reading.

Mr. C. J. HOWLETT exhibited four excellent plants of *Primula Crispia* which were full of flower.

The evening was set apart for "Ten Minutes" papers, and although six members had volunteered papers, there was only time for three to be read: Mr. H. Broomfield, "Carnations in Pots"; Mr. C. S. Clacy, "The Gardens, Sidmouth Grange, Reading, 'The benefit of Botany to the Practical Gardener'"; and Mr. A. H. FAULKER, The Gardens, Elmhurst, Reading, "Polyanthuses."

## ROYAL HORTICULTURAL.

## GROUPS.

APRIL 26 AND 27.—A full hall greeted those who attended the meeting of the Royal Horticultural Society this week, and as the exhibits were of greatly varied character, there was something to interest everyone. Orchids were fewer in number than usual, but some very fine new hybrids were shown and received awards. Daffodils were good for the date, especially the series of Poeticus varieties from Marsh Farm, Twickenham. Polyanthuses, Carnations, Roses, Freesias and alpine plants were capital features, while the big central rock garden exhibited by the Hon. VICARY GIBBS attracted a great deal of attention and won admiration from all.

Novelties were fairly numerous and included what were probably the first English-raised greenhouse Hydrangeas.

## Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the Chair), Mr. Gurney Wilson, (Hon. Secretary), Mr. Fred J. Hanbury, Mr. Clive Cookson, Mr. R. Brooman White, Mr. Stuart Low, Mr. Wilson Potter, Mr. R. G. Thwaites, Mr. J. Cowan, Mr. A. McPean, Mr. Charles A. Curtis, Mr. J. E. Shill, M. H. G. Alexander, Mr. Fred K. Sander, Mr. S. Flory and Mr. A. Dye.

## FIRST CLASS CERTIFICATES.

*Odontioda Titian* (parentage unknown).—A gloriously coloured hybrid with flowers of large size and perfect, rounded form. The colour is ruby-red, almost blood-red, with a few fleckings of white, and some basal white marks on the petals. The lip is rich red-brown and the disk golden yellow. Shown by J. J. BOLTON, Esq. (gr. Mr. Lyne), Claygate Lodge, Claygate.

*Odontioda Venus* var. *Aphrodite* (Oda. *Coronation* × Odm. *Aglaon.*).—A handsome hybrid of white ground colour, heavily and curiously marked with deep chocolate-red, an irregular band of this colour being continuous just within the margin, on the sepals and petals. The edges are rosy-mauve, as is the apex of the red, gold-disked lip. Shown by J. J. BOLTON, Esq.

## AWARDS OF MERIT.

*Odontoglossum Purple Empress* (parentage unknown).—The flowers are of large size, rosy-purple with white margins and a few white marks. The white-margined lip and red shading just below the golden disk are additional attractions. Shown by R. GERRISH, Esq., Milford Manor, Godalming.

*Odontoglossum Iphis*, *Brockenhurst* var.—This very handsome hybrid has yellow ground colour and heavy bars and markings of light brown. The lip has a yellow base and apex and a deeper yellow disk. Shown by F. J. HANBURY, Esq. (gr. Mr. Farnes), Brockhurst, East Grinstead.

*Brasso-Cattleya Ursula* (L-C. *Sargon* × *Brassavola Digbyana*).—A giant flower measuring nine inches across without spreading out the broad, mauve-purple petals, while from the top of the dorsal sepal to the apex of the fringed lip it measures eight inches. The sepals are rosy-mauve and the lip is purplish-mauve with yellow base and tube. Shown by Messrs. H. ALEXANDER, LTD.

## CERTIFICATE OF APPRECIATION.

*Burrageara Windsor* (*Oncidioida Cooksoniae* × *Odontioda Firminii*).—A distinct novelty that is the first of a new hybrid family which, like *Potinara*, combines four distinct genera. In this case, the combination is of *Oncidium Cochlioda*, *Odontoglossum* and *Miltonia*. The plant shown had a slender spike, about five feet long, with its flowers set somewhat widely apart. The blooms are not unlike those of a medium-sized *Odontoglossum*, and are marked and flushed with rose on a white ground. The habit of the plant suggests *Oncidium macranthum* and the shape of the flowers a modified *Odontoglossum*, while the lip is reminiscent of *Miltonia* descent, and the rose shading has, no doubt, originated from the *Cochlioda* ancestor. A very interesting Orchid and, we believe, the first to flower of a series obtained from the same cross. Shown by Messrs. BLACK AND FLORY.

Messrs. COWAN'S exhibit contained well-flowered examples of *Brasso-Cattleya Schilliana*, *Brasso-Laelio-Cattleya Jupiter*, *Laelio-Cattleya Hassallii alba*, *Miltonia Bleuana*, the curiously coloured and graceful *Vuylstekia* a *Adonis*, *Odontioda Vuylstekiae*, *Dendrobium atro-violaceum*, *Trichopilia Backhouseana* with eleven flowers, several *Cymbidiums* and the lovely *Odontoglossum citrosum*.

*Miltonia* William Pitt var. *Rosina*, with deep reddish and rose-coloured flowers, was conspicuous in Messrs. CHARLESWORTH AND CO.'S small group, associated with *Dendrobium infundibulum*, *Dendrobium thyrsiflorum*, *Vanda Herziana* (tricolor *superba* × *coerulea*), and several handsome *Odontoglossums*. Messrs. SUTTON BROS. showed *Odontoglossums*, *Cymbidiums*, *Cypripediums* and *Odontiodas*.

*Burrageara Windsor*, shown by Messrs. BLACK AND FLORY, was interesting to all Orchid growers, as its parentage is *Oncidioida Cooksoniae* × *Odontioda Firminii*, so that it combines four genera. The spike was about five feet long and carried nineteen flowers and buds; the open flowers have a white ground, and flushes of rose, as in many forms of *Odontoglossum crispum*; indeed, a good general description would be rose-tinted *O. crispum* flowers on a spike and plant of *Oncidium macranthum*.

R. BROOMAN WHITE, Esq., Arddarrock, showed a number of seedlings of his choice, white *Odontoglossum crispum*; all were fine in size, form and substance. Mr. HARRY DIXON showed several *Odontiodas*, notably *O. Beechense*, *O. Bradshawiae*, *O. Joan* and *O. Vuylstekiae*.

Four lovely plants were shown by J. J. BOLTON, Esq. (gr. Mr. Lyne), Claygate Lodge, Claygate; these were *Odontioda Titian* (parentage unknown), of exquisite form and ruby-red colour; *O. Orestes* var. *Butterfly*, carrying sixty-two handsome flowers; *O. Gladys* var. *Perfection*, and *O. Venus* var. *Aphrodite*.

Mr. J. EVANS and Mr. R. GERRISH also showed a few plants, and Messrs. H. G. ALEXANDER, LTD., showed grand specimens of *Brasso-Laelio-Cattleya Ursula*, *B.-C. speciosa*, *Odontioda Lambeauiana*, *Westonbirt* var., and *O. Radiance*.

## Floral Committee.

Present: (Section A.)—Mr. H. B. May (in the Chair), Mr. J. F. McLeod, Mrs. Ethel M. Wightman, Mr. H. J. Jones, Mr. D. Allan, Mr. Hugh Dickson, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. M. C. Allwood, Mr. E. R. James, Mr. R. Findlay, Mr. A. E. Vasey, Mr. W. H. Page, Mr. Jas. B. Riding, Mr. Geo. Churcher, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mr. Courtney Page, Mr. G. W. Leak, Mr. Charles E. Pearson and Mr. Cartwright (Secretary).

(Section B.)—Mr. Charles T. Musgrave (in the Chair), Sir William Lawrence, Bt., Mr. G. Reuthe, Mr. Mark Fenwick, Mr. Reginald Cory, Mr. F. G. Preston, Mr. Eric M. Marsden-Jones, Mr. L. R. Russell, Mr. R. W. Wallace, Mr. G. Yeld, Mr. H. C. Baker, Mr. T. Hay, Mr. Clarence Elliott, Mr. W. G. Baker, Mr. W. B. Cranfield, Mr. E. A. Bowles and Mr. N. R. Gould (Secretary).

## AWARDS OF MERIT.

*Anemone High Hall Strain*.—A large vase of very handsome flowers was shown. In general characteristics they approach *Anemone fulgens* with a pleasing range of colouring; but bright scarlet, rosy-scarlet and clear salmon predominated. Most of the flowers have a distinct white zone. Shown by Messrs. BERNARD, LTD.

*Cydonia Wisley Salmon*.—This is a profusely-flowered variety of the Japanese Quince which is more commonly known as *Pyrus japonica*. The salmon colour only appears after the flowers have become fully mature; earlier they are of a bright red colour. It is a desirable shrub. Shown by the DIRECTOR, R.H.S. Gardens, Wisley.

*Daphne retusa*.—This desirable species has a certain resemblance to *D. odora*, but differs in being of more sturdy habit and in having smaller, thicker leaves. *Daphne retusa* was discovered by A. E. Pratt in Western China, at an elevation of 13,500 feet, in 1889. It is

a sturdy little, much-branched shrub, bearing large, robust clusters of white flowers heavily stained with purple on the outsides and possessing a rich Lilac-like perfume. It is figured in *Bot. Mag.*, 8,430. Shown by Sir WILLIAM LAWRENCE, Bt. (gr. Mr. Everett).

*Eritrichium nanum*.—A small plant bearing three little racemes of this dwarf alpine was shown. The flowers are of a rich azure-blue and have the general appearance of very dwarf *Forget-me-Nots*. It was introduced to our gardens from the Alps in 1869, and is figured in *Bot. Mag.*, 5,832. Shown by Mr. A. J. SEWELL, Ronnelly, Weybridge.

*Hydrangea H. B. May*.—This and the two following are of special interest in that they appeared in the first batch of seedling *Hydrangeas* raised in this country. The variety *H. B. May* has a large, shapely truss, the "pips" are also large and of medium pink colour lightly shaded with mauve at the edges. All three were shown by Mr. H. J. JONES.

*Hydrangea J. F. McLeod*.—This variety has a compact head of medium-sized, bright pink flowers, and is of great decorative value.

*Hydrangea Lord Lambourne*.—The trusses are large and shapely, and the individual flowers, which are above the average size, are of a pleasing soft pink colour.

*Lysichitum camtschaticense*.—Several good spathes of this bog plant, which may well be called the "Golden Arum of North America," were shown. The large, hooded, shining yellow spathes are thrown up slightly in advance of the foliage and are of striking appearance. Even after the flowers have faded, the large, handsome leaves have considerable attraction. A good illustration of the plant appeared in *Gard. Chron.*, April 6, 1916. Shown by Messrs. M. PRICHARD AND SONS.

*Olearia ramulosa*.—A graceful, free-flowering, little shrub, sparsely furnished with very small, leathery, spatulate leaves and plentiful clusters of relatively large, white flowers. Shown by Sir WILLIAM LAWRENCE, Bt.

*Primula ninguida*.—This uncommon species belongs to the *Nivalis* series. It is of a sturdy, compact habit. The entire, ovate, green leaves are occasionally powdered while the flower buds are heavily covered with meal. The thrum-eyed flowers are about an inch across, of bright purple colour, darker towards the centre. There is a golden rim to the tube which is of bright yellow colour. Shown by Lt.-Col. MESSEL.

*Rhododendron Linley*.—A hybrid *Rhododendron*, bearing goodly trusses of large, widely-expanded flowers of soft pink shading, which have a small cluster of carmine spots at the base and large purplish bracts.

*Rhododendron Oliver*.—Of similar type to the previous, though the flowers do not expand quite so widely. They are coloured a deep shining pink on the outsides, and are paler within. Both were shown by Lt.-Col. MESSEL (gr. Mr. J. Coomber), Nymans, Haywards Heath.

*Syringa Lamartine*.—This is a hybrid "Lilac," and bears large trusses of single, lilac-coloured flowers which have fair fragrance. Shown by the DIRECTOR, Royal Gardens, Kew.

## FOR TRIAL AT WISLEY.

*Carnations Mrs. A. J. Cobb* and *W. H. Page*.—These two perpetual-flowering *Carnations*, which received Awards of Merit on April 9, last, were selected for trial at Wisley. The former variety was illustrated in *The Gardeners' Chronicle* of April 9.

*Iris pumila* variety.—A good, dwarf *Iris* which has dark, metallic purple falls and lilac coloured hairs on the standards. Shown by Mrs. W. R. DYKES, Bellingcourt, Woking.

## GROUPS.

Immediately inside the hall, there was a magnificent exhibit from the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree. This was in the form of a boldly arranged rock garden leading up to a shrubbery well filled with profusely flowering specimens, and the whole was enclosed with a neat bordering of grass. The shape of the exhibit was, of necessity, rectangular, but the limitations of

space and position were overcome in an admirable manner, and a most successful garden was the result. The principal shrubs were Laburnums, Japanese Maples, Berberises, Viburnum Davidii, Japanese Azaleas in many good varieties and shapely Conifers of the type most valued for the rock garden. Towards the entrance there was a pleasant little rocky pool, while on the lower levels there were many alpine and dwarf border plants in flower.

Another very interesting and valuable collection of alpine in pots and pans was shown by C. G. KIRCH, Esq., (gr. Mr. J. Wall), Edenham, Beckenham. Amongst other noteworthy plants he included *Rhododendron calostrotum*, *Daphne rupestris grandiflora*, *D. Cneorum*, *D. fioniana*, *Aethionema Warley hybrid*, *A. jucunda*, *Aquilegia flabellata nana*, *Androsace villosa*, *Tulipa Batalinii* and *Iris pumila purpurea*. Mr. G. H. DALRYMPLE staged a good selection of Bartley hybrids of *Primula pulverulenta* and a few vases of his coloured *Freesias*.

A large basket of *Polyanthus Greenways' Glory*, which received an Award of Merit last year, was shown by Miss CHRISTY, Boyton Cross, Chelmsford, with several good varieties of double-flowered Daisies and *Gentiana acaulis*. The Misses HOPKINS and Mr. J. ROBINSON had small rock gardens planted with seasonable subjects. Messrs. BAKERS, LTD., used *Primulas*, *Gentians*, *Kalmia latifolia* and Japanese Azaleas to effect in their rock garden, while Messrs. HODSONS, LTD., employed various *Aubrietias*, *Muscari*, *Brooms*, *Berberises* and *Cydonias*.

In a well-designed sandstone rock garden, Messrs. Wm. CUTBUSH and SON planted *Irises*, *Primulas* and dwarf Azaleas, with a background of deciduous flowering shrubs. Messrs. W. H. ROGERS and SON planted *Daphne Cneorum* and various alpine. Mr. GAVIN JONES had several interesting species of *Semprevivum*, *Gentiana verna*, *Drabas* and dwarf Conifers. Mr. H. HELMSLEY staged many alpine, Japanese Azaleas, *Grevillea rosmarinifolia* and *C. sulphurea*.

In their rock garden exhibit Messrs. JEANS and TROWBRIDGE included *Fritillaria*, *Gentiana acaulis*, *Antirrhinum Asarina* and Japanese Azaleas. Messrs. TUCKERS, LTD., had a quantity of *Campanula Stevens's nana*, *Gentiana verna angulosa*, *Fri illarias*, *Trillium grandiflorum* and *Cytisus Beanii*, while Messrs. MAXWELL and BEALE had *Gentians*, double-flowered Daisies, Azaleas and *Ericas*.

An interesting exhibit was staged by the CENTRAL GARDEN SUPPLIES Co., who included *Kalmia latifolia*, Conifers, *Primulas*, *Brooms*, *Cydonias*, *Gentiana acaulis*, and *Shortia uniflora grandiflora*. Messrs. B. LADHAMS, LTD., had a large batch of *Cardamine lilacina plena*, *Forget-me-Nots* and *Polyanthuses*. Messrs. M. PRICHARD and SONS had good plants of *Iberis*, *Dodecatheon gigantea* and other seasonable alpine.

On the staging, Messrs. L. R. RUSSELL, LTD., had a pleasing collection of *Wistarias*, *Laburnums*, *Pyruses*, Azaleas *rosaeflora*, *A. Hinomayo*, *Ivies* and other shrubs. Trusses of various *Rhododendrons*, *Camellias*, *Magnolias* and Azaleas were exhibited by Mr. G. REUTHE. Mr. F. G. WOOD had *Daphne Cneorum*, *Scilla alba*, *Primulas* and other spring flowers.

An exceedingly interesting collection of *Hydrangeas* was set up by Mr. H. J. JONES. This was a selection of the first seedlings raised in this country and the plants were all of good, sturdy habit and bore compact, well-formed heads of flowers. There was a considerable variation in form and colouring and all were of pink shades. We understand from Mr. H. J. Jones that the seeds were sown under glass only fifteen months ago.

CAPTAIN COLLINGWOOD INGRAM, The Grange, Bennenden, staged a very interesting collection of the later-flowering varieties of Japanese Cherries from his well-known collection, which includes considerably over one hundred distinct varieties of these handsome spring-flowering trees. On the present occasion he showed twenty-one varieties which well illustrated the diversity of floral form and colouring.

There were collections of very good *Polyanthus* arranged by several exhibitors. In association with his admirable *Hydrangeas*, Mr. H.

J. JONES had many good plants of a desirable strain. Messrs. DOBBIE and Co. had a fine collection in large pots, while Messrs. BLACKMORE and LANGDON arranged their desirable strain in bold colour masses. Messrs. JOHN and A. CROOK also staged plants of a very good strain. Mr. G. W. MILLER also showed *Polyanthuses*.

Roses of good quality were shown by Messrs. B. R. CANT and SONS and Mr. J. R. PEMBERTON.

Adjoining their Carnations, Messrs. STUART LOW and Co. had a collection of excellent *Mimosas*, with large *Hippeastrums*, *Boronia megastigma*, *Chorizema cordata* and *Gerbera* hybrids. Messrs. JOHN PEED and SON exhibited plants of a splendid strain of *Streptocarpus*. There were many very well-grown plants bearing large flowers of very beautiful colours. Messrs. SUTTON and SONS showed a good collection of *Cineraria* hybrids in well-flowered plants of good colours, while in another part of the hall they had a collection of Dutch *Irises* in many named varieties. Messrs. JARMAN and Co. staged an interesting collection of Zonal *Pelargoniums*, mostly in good single-flowered varieties.

Good collections of Carnations were shown by Messrs. STUART LOW and Co., Messrs. ENGELMANN, LTD., and Messrs. ALLWOOD BROS., while Mr. A. F. DUTTON had several vases of his new variety Mrs. A. J. Cobb. Mr. BALDWIN PINNEY and Mr. J. J. KETTLE showed *Violets*, and the latter included a few *Polyanthuses* in his exhibit.

Messrs. J. CARTER and Co. had a pleasant group of well-flowered plants of *Cineraria* Bouquet Pink and *Lilium longiflorum* (Harrissii).

#### Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (in the Chair), Mr. G. W. Leak, Mr. P. D. Williams, Mr. Peter R. Barr, Mr. W. B. Cranfield, Mr. F. H. Chapman, Mr. Charles H. Curtis, Mr. F. Secrett, Mr. C. Tichmarsh, Mr. G. Churcher, Mr. J. Jones, Miss Willmott, Mr. Arkwright, Mr. W. Poupart, Sir Daniel Hall, and Mr. A. Simmonds (Secretary).

#### AWARDS OF MERIT.

*Narcissus Venetia*.—This chaste Triandrus hybrid is pure white throughout and of graceful poise. It had previously received an Award of Merit and is now the first variety under the new regulations to receive the Award of Merit "for cutting," as it has been on trial at Wisley. Shown by Mr. W. B. CRANFIELD, Enfield.

*Narcissus Mayflower* (III. a.).—A Barrii variety with an immense amount of Poeticus blood in it. The rounded, substantial flowers are milk-white with an orange-red cup. A grand flower for show purposes (for which it gained the award), and also for market; it was selected for trial at Wisley for cutting purposes. Raised by Mr. Engleheart. Shown by Mr. F. SECRETT, Marsh Farm, Twickenham.

#### CERTIFICATE OF APPRECIATION.

*Narcissus Engleheart's White Rose*.—A lovely, finely proportioned, double, white variety; indeed, the finest double white *Narcissus* we have seen. The segments are broad and rounded, making up a daintily beautiful and shapely flower of great value; it is sweetly scented, as becomes a Poeticus variety. Raised by Mr. Engleheart. Shown by Mr. F. SECRETT, Marsh Farm, Twickenham.

#### SELECTED FOR TRIAL AT WISLEY.

*Narcissus Papyrus*.—A fine Poeticus variety of splendid shape and substance (see Fig. 147, p. 301). Shown by Mr. F. SECRETT.

*Narcissus Nanette*.—A semi-double Leedsii variety with wide outer segments and very irregular central ones. The exhibitor's name did not appear on the card.

*Narcissus Snowsprite*.—Another Leedsii variety, but more double and regular than the former, although, even so, it is only semi-double. This should become a very useful market flower. Shown by Messrs. BARR and SONS.

#### GROUPS.

Messrs. BARR and SONS had a large collection which contained many very desirable varieties. There were some seedlings of various divisions and of great merit. Amongst their named

varieties we especially noted Alcida, Gallipoli, Cinderella and ovidus of the Giant Incomparabilis division; Snow King, Cruso and Kestrel, lovely Poeticus varieties; Niobe and Phyllis Rochfort, two Barrii varieties, which have vividly coloured coronas; Amadis, a giant Trumpet Daffodil, and Mrs. R. O. Backhouse, which is still the best of the varieties which have pink colouring on the corona. At one end of the exhibit Messrs. BARR and SONS had a few well-flowered plants of *Gentiana verna*.

Amongst nearly one hundred vases of *Narcissus Poeticus*, staged by Mr. F. SECRETT, it was not possible to find any two alike, for there was definite differences in the perianth or the corona in all. In addition to the extent of the exhibit, which was stated to be of flowers gathered at Twickenham from the open ground on the morning of the show, all the flowers were of very high quality. These splendid Poeticus *Narcissus* were all under seedling numbers and, in addition, there were a vase each of *Papyrus* of the same type, and of Folly, a handsome Incomparabilis variety.

In an interesting collection, Mr. J. W. BARR included several very good seedlings and also had admirable vases of Triton and Phyllidea two giant Incomparabilis; Hecaste, a sulphur-coloured Trumpet; Hera, a lovely Leedsii; Lady Brilliant, a well-formed Poeticus; Pink Opal, a Leedsii with a long tube, rimmed with salmon, and Queen of Spain. Mr. J. W. BARR also had several vases of Darwin Tulips of well-known varieties.

In a smaller collection, Messrs. STEWART and SON had several vases of the fragrant Jonquilla *Narcissus* Admiration, a Tazetta variety, Gay Hussar, Barrii, and Agnes Harvey, a Leedsii variety.

#### Fruit and Vegetable Committee.

Present: Mr. E. A. Bunyard (in the Chair), Mr. G. Tinley, Mr. A. Bullock, Mr. T. Pateman, Mr. J. Wilson, Mr. W. Giles, Mr. A. Poupart, Mr. E. Beckett, Mr. E. Neal, Mr. W. H. Divers, Mr. H. V. Taylor, Mr. W. Lobjoit, Mr. E. Laxton and Mr. A. N. Rawes (Secretary).

The only exhibit before this Committee was one of perennial Broccoli, shown by Messrs. DOBBIE and Co. This is a branching type of Broccoli, somewhat similar to the variety Bouquet, which was introduced some thirty years ago, and others of a similar type are Late Queen, Hen-and-Chickens and Nine Star Perennial. The plants continue to provide a succession of heads for some five or six years if they are mulched and the central inflorescence cut off to prevent flowering. It is a very valuable type of Broccoli for use late in the season as it comes in with the sprouting type of Broccoli. Mr. Beckett stated that he had grown the variety for five or six years, and strongly recommended it. He said it is very hardy, and the plants will crop for five or six years in succession. The curds on the plants exhibited were yellow, but it was stated that by tying up the leaves, heads of a whiter and better appearance may be secured for the table.

#### LINCOLNSHIRE DAFFODIL.

THE chief floral event of the year locally, and the only exhibition of its kind in the county, the Lincolnshire Daffodil Show was held at Spilsby, in the north of the county, on April 13, when the Drill Hall was a blaze of flowers.

The exhibition was not held in 1926 owing to the unfavourable season, but on the present occasion entries were larger than ever, numbering one hundred and fifty-two.

In the open class, the Silver Cup for a collection of up to forty vases, representative of the most important divisions, was won by the SPALDING BULB COMPANY.

In the section open to amateurs, the Silver Vase presented by Messrs. Barr and Sons, was awarded to Mrs. ERIC WRIGHT, Spilsby, for twenty distinct Daffodils. Messrs. Cartwright and Goodwin's Vase, offered for eight varieties, was won by Mr. N. S. ROBINSON, Hundleby, near Spilsby.

Other leading prize-winners were:—Colonel C. A. SWANN, C.M.G., Sausthorpe Hall, Mr. B.

ROBINSON, Mrs. ROLING, Mr. H. DUNKLEY, Skegness, Mr. N. S. ROBINSON, Rev. H. G. ALINGTON, Mrs. FREW, Candlesby Hall, Rev. Canon H. L. HARRISON, Mrs. W. RAWNSLEY, O.B.E., Well Vale, Alford, Mrs. F. W. CAPES, and Rev. G. H. HARRIES.

### NORFOLK AND NORWICH HORTICULTURAL

THE Spring flower show of the Norfolk and Norwich Horticultural Society was held in St. Andrew's Hall, Norwich, on April 7, 8 and 9.

Although the season was somewhat early for many of the choicer Narcissi, there was a very fine display. Captain SANDYS WINSCH, Brundall, won the Challenge Cup and first prize in the class for twenty-four varieties of Daffodils and Narcissi with a fine exhibit. Other prominent exhibitors in this section were Captain J. H. MANDER, Thorpe, who staged many beautiful seedlings of his own raising, and won the Gold Medal offered for the best bloom in the show with a superb large, deep yellow flower labelled "E. 3." The Hon. Mrs. PETRE, Westwick, staged a fine collection of Trumpet Daffodils, many of them seedlings. Mr. C. H. WALTER, Drayton, also had some very good blooms.

There was a fine display of flowering shrubs, choice specimens being contributed by J. A. CHRISTIE, Esq., M.P. (gr. Mr. S. High), Framingham Manor, and J. E. MOXEY, Esq., Framingham Hall, with a fine display of the earlier Rhododendrons from the Hon. Mrs. PETRE, Westwick. Other spring flowers were well represented.

Pot plants were an outstanding feature of the exhibition, especially Calceolarias, Schizanthuses and Cyclamens, staged by Mrs. H. J. COPEMAN, Westwood House, Norwich (gr. Mr. Mitchell).

Fruit was not a strong feature, but some very good Strawberries were shown by J. A. CHRISTIE, Esq., M.P.

The trade was represented by Messrs. DANIELS BROS., LTD., who had a variety of hardy spring flowers; Mr. G. W. MILLER, Wisbech, who also showed many kinds of spring flowers; Messrs. ALLWOOD BROS. and Messrs. C. ENGELMANN, LTD., each of whom showed Carnations; Messrs. BAKERS, LTD., Wolverhampton, exhibited rock plants and shrubs; Messrs. R. WINDER, LTD., Lingwood, arranged a miniature rock garden; Messrs. R. H. BATH, LTD., Wisbech, contributed fine Narcissi and Tulips growing in bowls; Messrs. A. J. AND C. ALLEN, Norwich, showed Roses, including two new seedlings of merit; Messrs. A. REEVES AND CO., Old Catton, also displayed Roses with other flowering shrubs; Mr. H. PRINS, Wisbech, and THE WELSH BULB FIELDS, both of whom had displays of Daffodils, and Mr. BALDWIN, Pinney, who showed Violets.

### GENERAL BULB GROWERS OF HAARLEM (HOLLAND).

THE Floral Committees of the General Bulb Growers' Society, Haarlem, have awarded the following Certificates to Tulips and Daffodils during the winter session, 1926-7.

#### EARLY FORCING CERTIFICATES.

*Tulip Allard Pierson*.—A carmine-red Darwin variety. Shown by Messrs. A. AND P. NIJSSEN BROS., Sanpoort.

*Tulip Early Yellow*.—An early, single, clear golden-yellow variety; its form resembles that of the single, late Tulip Elegans. Shown by Mr. J. C. VAN DER EYKEN.

*Tulip Linnaeus*.—A mauve-coloured early, single variety. Shown by Mr. TH. VAN DER VLUET.

*Narcissus Christmas Glory*.—A golden yellow Trumpet variety. Shown by Messrs. W. J. ELDERING AND SON, LTD., and by Mr. C. A. VAN PARIDON.

#### FORCING CERTIFICATES.

*Tulip Alice*.—A double white variety of globular form. Shown by Messrs. TH. AND P. VAN DER NOULAND.

*Tulip Aurora*.—An early, double, orange-red variety. Shown by Mr. TH. F. VAN RIJN.

*Tulip Beryll*.—An early double variety; the flowers are satin-pink with white. Shown by Messrs. G. SLUYTER AND CO.

*Tulip Golden Chief*.—An early, primrose-yellow variety, bordered with golden-yellow. Shown by Messrs. A. AND P. NIJSSEN BROS.

*Tulip Lady Moore*.—An early, single, orange-red variety. Shown by Messrs. C. BLOM AND SON, and Messrs. P. BYVOET AND CO.

*Tulip Morning Glory*.—An early, single, brown-orange variety with yellow base. Shown by Messrs. DE GRAAFF BROS., and Messrs. S. A. VAN KONIJNENBURG AND CO., LTD.

*Tulip Redbreast (Ibis light)*.—An early, single, variety, flamed carmine-red. Shown by Messrs. WARNAAR AND CO.

*Tulip Thomas Edison*.—An early, single orange-red variety; the petals are bordered with old-gold. Shown by Messrs. DE GRAAFF BROS., and Messrs. S. A. VAN KONIJNENBURG AND CO., LTD.

*Tulip Wildfire*.—An early, single variety, coloured orange-red on a yellow base. Shown by Messrs. DE GRAAFF BROS., and Messrs. S. A. VAN KONIJNENBURG AND CO.

*Narcissus Harbinger (bicolor)*.—The white perianth is formed like a star; the trumpet is well-shaped and coloured dark yellow. Shown by Messrs. R. A. VAN DER SCHOOT, LTD.

*Narcissus Locarno*.—A bicolor variety with white perianth and sulphur-yellow trumpet. Shown by Mr. K. OUDSHOORN.

*Narcissus Wilson*.—The perianth is pure white, the trumpet lemon-yellow. Shown by Messrs. DEN OLDER BROS.

*Narcissus Concordia (Titan)*.—A big, stout, Trumpet variety, with well-shaped, golden-yellow perianth, the trumpet wide-opened, and somewhat darker coloured than the perianth. Shown by Messrs. C. G. VAN TUBERGEN JR.

*Narcissus Star (Incomparabilis)*.—The perianth is white and the trumpet yellow. Shown by Messrs. R. A. VAN DER SCHOOT, LTD.

*Narcissus White Emblem (Leedsii)*.—The small trumpet is pure white. Shown by Messrs. H. DE GRAAFF AND SON, LTD.

## Obituary

**George Mount, V.M.H.**—The passing of Mr. George Mount (see p. 296), of Canterbury, creates another gap in the ranks of those veteran horticulturists who were famous even in Victorian times. Our friend—he often called at *The Gardeners' Chronicle* office when in town, to chat about old times—who died on April 22, had reached the advanced age of eighty-three years, and alas! had not enjoyed good health for the past year or more. The life story of Mr. George Mount is one of the romances of industry. He was not brought up to follow horticultural pursuits; but his love for flowers and plants led him to take up their cultivation as a business, and it was with Roses that he became famous as a grower and exhibitor. From Roses to fruit trees was an easy transition, and very soon he was as famous for fruits and fruit trees as for Roses. Hop cultivation also attracted him and he became an extensive grower. As his sons grew to manhood they assisted materially in the development of the business and launched out as market growers of Roses, Carnations and fruits. Mr. George Mount had a delightful personality, always genial, smiling and unassuming, and never failing to credit his sons with their full share of the great developments raised on the foundation he laid. His interest in the National Rose Society never waned, and he loved to talk of the trophies won and the fine flowers exhibited in bygone days. He took a keen interest in local affairs and was twice Mayor of Canterbury. The well-deserved honour of the Victoria Medal of Honour in Horticulture awarded him by the Royal Horticultural Society in 1925 gave him a vast amount of pleasure, especially as his modesty scarcely permitted him to believe he had done anything more than others to merit the honour. Throughout his long life he was diligent in business, took a paternal interest in his staff and was kindly and gentle to everyone.

## ANSWERS TO CORRESPONDENTS.

**FUNGUS AND MOSS ON LAWN.**—*E. M.* The bad weed on the lawn is a lichen, which is partly a fungus and partly a green Alga. The remedy for a fungus actually buried in the soil is to soak the ground thoroughly with Bordeaux mixture four times at intervals of eight days; but as the weed is on the surface in this case one or two applications may suffice. Bordeaux mixture may be made with 3 lb. of copper sulphate, 2 lb. of quick lime and 25 gallons of water. The copper sulphate should be dissolved in a wooden barrel capable of holding the full amount. The lime may be dissolved in any kind of vessel and filtered into the copper sulphate to remove the lumps and grit. There were several species of moss mixed with the lichen sent, showing that the soil is acid. A liberal dressing of newly-slaked lime would correct this, and we think it would also check the growth of the lichen, as well as cause the grass to grow more freely. A sprinkling of sulphate of ammonia, or a dusting of lawn sand late in May would also encourage the growth of the grass.

**LETTUCES DISEASED.**—*P. T.* The young Lettuce plants submitted to us are attacked by a fungus, *Botrytis* sp. Damp conditions at the soil surface encourage this disease and therefore you must endeavour to keep the surface dry by hoeing and lightly dusting it with lime. A two per cent. solution of calcium bisulphate will destroy the spores of this fungus, and it may pay you to treat badly diseased patches with this compound, which should be applied either by a spraying machine or through a rose can. In the process, the soil surface and the collar of the plants should be wetted. A light dressing of nitrate of soda or sulphate of ammonia will impart additional vigour to the plants, and may assist them to resist the disease.

**NAMES OF PLANTS.**—*H. B.* 1, *Jacobinia magnifica* var. *carnea*; 2, *Sprekelia (Amaryllis) formosissima*; 3, *Cypripedium bellatulum*; 4, *C. Spicerianum*; 5, *Trachelopermum (Rhyncospermum) jasmimoides*.

**PESTS IN A GARDEN.**—*Woolston.* The creatures sent in a box of soil were not insects, but one of the more numerous and more destructive snake millipedes, namely, *Blanjulus pulchellus*. It is destructive to the seeds of Peas, Broad Beans, Scarlet Runners, etc. In wet weather in spring, germination is hindered and these pests have a longer time in which to destroy the seeds. Potato tubers and the roots of many other vegetables are attacked by the pest. The soil sent was very black showing that there is much decaying vegetable matter in it; millipedes are very frequent and abundant in such soils. A liberal dressing of newly-slaked lime would improve the ground and help to kill or drive away the pest. A dressing of soot now and again is also recommended. The soil may be greatly renovated by trenching it two feet deep or more, putting the top spit in the bottom. The trenching could be commenced in October and continued after the several vegetable crops are cleared. A species of mite was also present in large numbers, but we think it only follows the millipedes to feed on decaying matter.

**VIOLETS DISEASED.**—*A. E. F.* The fructifications (pycnidia) of a fungus, probably *Phyllosticta violae*, were present on the plants received. All remains of diseased plants should be destroyed, and, owing to the danger of some diseased parts remaining in the frame, the soil should be replaced by fresh compost and the inside of the frame cleaned before any new stock is introduced. *J. B.*—The disease on the Violets is caused by a fungus, a species of *Ramularia*. Probably the best way to deal with this disease is to obtain new stock.

**Communications Received.**—*H. H.* Thanks for 2/6 for R.G.O.F. Box.—*C. G. A.*—*A. B.*—*J. H. B.*—*A. McC.*—*J. E. G. W.*—*J. C.*—*E. A. B.*—*W. B. G. H.*—*W. G. R.*—*G. B.*—*H. E. D.*—*E. S. S.*—*H. R.*—*H. A.*—*R. E. A.*—*G. R.*—*W. A.*—*C. T. H.*—*C. F. C.*—*H. B. W.*—*H. N. G.*—*A. G.*

## MARKETS.

COVENT GARDEN, Tuesday, April 26th, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—Eps.

REMARKS: Supplies, in the main, have exceeded the moderate demand during the past week, and generally prices have been on the down grade. Daffodils from home-growers are now practically finished for the season, but daily consignments of these blooms are coming to hand from Scotland, including Emperor, Barrii and Sir Watkin. The quantities of Tulips again exceeded the present demand owing to the increasing supplies of out-door blooms; the largest numbers are coming from Guernsey and the West of England. Spanish Irises and coloured Gladioli are being received from Guernsey in good condition. More Gardenias and Sweet Peas are on offer, and Iceland Poppies are now available. Trade in other subjects show little change from that of last week, with a general fall in prices. Consignments of flowers from France are gradually lessening; white Stock is much firmer in price. Anemones and all Ranunculus are arriving in a very advanced condition and unsuitable for re-dispatch. Gypsophila, Ixias and yellow Marguerites are receiving most attention from buyers. A few baskets of Statice sinuata, blue, have been received in good condition.

REMARKS.—Business conditions in Covent Garden have been very much more lively than for some time past, the general improvement in the weather contributing to both the production and consumption. The heavy shipments of fruits from the Cape have sold moderately well. The principal fruits now arriving from South Africa are Pears and Grapes with a few Plums and Pines. Australian growers are sending Apples, Pears and Grapes, all of which are popular and sell well. The first English Gros Colmar Grapes from the Worthing district are now available, and considering the competition with other choice fruits, they are selling very well indeed at comparatively high prices. Forced Strawberries are slightly cheaper but remain expensive. The first forced Figs for the season are now on the market. Oranges have been a shade better market, and the demand for Lemons has also slightly improved. Trade in forced vegetables has been influenced by the quantities of French Asparagus on the market. Peas and French Beans are both offered at lower prices, and the earlier cuttings of Worcester Asparagus have felt severely the competition of cheap Asparagus from France. Much better supplies of English Tomatoes are available, but their prices keep up very well indeed. The value of Cucumbers is, however, easier, but at the time of writing, there seems prospects of better prices being realised. Mushrooms are a more stable market as compared with last week, and while supplies are heavy the demand seems good enough to justify present prices holding. Trade in salads is not particularly good; a few first-grade Lettuces are wanted, but not much else is in great demand. Green vegetables and Cauliflowers are a disappointing market to the producers, cheap Asparagus being largely responsible for the poor demand. With fairly plentiful supplies of new Potatoes from Spain, the Canary Islands, Azores, Guernsey and the Scilly Isles, the trade in old Potatoes is moderate, and best sorts only are enquired for.

## GLASGOW.

The incidence of the spring holiday and the wet weather had a depressing effect on prices of cut flowers during the past week, while excessive supplies contributed to the weakness. Lilium longiflorum (Harrisii) and Richardias were particularly cheap at 2/- to 3/- per dozen, and both Carnations and Roses were abundant at 2/- to 3/6 per dozen. Prices of Daffodils continued at the previous low levels. Emperor and Sir Watkin being worth 1/6 to 2/6 per dozen bunches; ornatus, 1/- to 1/6; Glory of Lisse, 2/- to 2/6; and King Alfred, 3/- to 6/-. Outdoor Tulips ranged 2/- to 4/- per dozen bunches for 6's, while indoor-grown blooms of William Copland made 8d. to 1/- for 6's; Barton. White Hawk and William Saunders, 10d. to 1/-; Iris kept steady at 2/- to 3/- for 12's; Lilac realised 9d. to 1/3 per bunch; Lily-of-the-Valley, 2/6 to 3/-; Anemones, 1/- to 2/- per dozen; and Wallflowers, 9d. to 1/6. Marguerites, Spiraeas and Dutch Azaleas, realised from 1/- to 1/6 per pot. Bedding plants, of which there was a glut, were practically unsaleable.

The fruit market was inactive and featureless. Apples: Albemarle Pippin sold for 30/- to 40/- per barrel; Newtown Pippin, for 15/- to 17/6 per case; Winesap, extra fancy, 12/- to 13/6; and fancy, for 10/- to 12/-; Oranges: Porto Rico, realised 18/- to 20/- per case; Jaffa, 14/6; 19/6; 24/6; 21/-; Valencia, 30/6, 18/6 to 23/-; 24/6; 22/- to 25/-; 36/6, 12/- to 15/-; Porto Rico Grape Fruit fetched 20/- to 25/-; Blue Goose brand, 32/-; The value of South African fruit was as follows: Doyenne du Commerce Pears, 12/-; red and white Hannepoot Grapes, 7/- to 8/-.

In the vegetable section prices of Tomatoes advanced to 36/- and 40/- per bundle for Tenerife produce, and 2/6 to 2/9 per lb. for Guernsey. Cucumbers realised 4d. and 5d. each; Cauliflowers made 2/6 per dozen; Lettuces, 1/6; Madeira Beans, 2/6 per lb., and Carrots, 9d. per bunch.

## CATALOGUES RECEIVED.

CLIBRANS, LTD., Altrincham.—Grasses for sports grounds. OLIVER AND HUNTER, Moniaive, Dumfriesshire.—Alpine and herbaceous plants.

## GARDENING APPOINTMENT.

Mr. J. Osmond, previously gardener for eleven-and-a-half years at Ebrington Hall, Campden, Gloucestershire, and for the past two years gardener to R. L. SASSIE, Esq., at Morningside, Harbury, Leamington Spa. As gardener to the same gentleman at The Gorse, Priory Road, Bowdon, Altrincham, Cheshire. (Thanks for 2/- for R.G.O.F. Box.)—Eps.)

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

### BOROUGH OF FOLKESTONE. CEMETERY SUPERINTENDENT.

THE Folkestone Corporation invite applications for the appointment of Superintendent at their Cemetery situate in the Parish of Hawkinge.

Applicants must be competent Gardeners and able to supervise the general work of a Cemetery.

The salary will be £240 per annum rising to £280 per annum (by increments of £10 per annum) subject to satisfactory service, with unfurnished quarters and water.

Five per cent. of the salary will be deducted for purposes of the Local Government and other Officers' Superannuation Act, 1922, and 15/- per week as rent of the unfurnished quarters, and the appointment will be subject to satisfactory report upon medical examination.

Applications, stating age and experience, with copies of three recent testimonials, and the envelope marked "Cemetery Superintendent," to be addressed to the undersigned and delivered at the Town Clerk's Office not later than 14th May, 1927.

Canvassing, directly or indirectly, will be a disqualification.

By Order,

A. F. KIDSON,

Town Clerk.

Town Clerk's Office,  
Folkestone,  
21st April, 1927.

**WANTED, ASSISTANT GARDENER** for a London Public Park, age between 25-30, experienced Inside and Out and accustomed to motor-mower; wages and present bonus 55/-; must be well recommended. The person appointed will be required to contribute towards a superannuation fund and to pass a medical examination.—A. B. C., Box 80, 5, Tavistock Street, Covent Garden, W.C.2.

## PRIVATE.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.*

### PRIVATE.

**HEAD GARDENER** desires engagement in good establishment where high-class gardening is required. Life experience in good establishments; thoroughly experienced in all branches; married, no family, age 47.—**ALLAN MOUNTFORD**, Shrewsbury Park, Shooters Hill, S.E.18.

JOHN PEED & SON

The King's Seedsmen and Nurserymen West Norwood London

### KELWAY'S GLADIOLI

are undoubtedly still the finest kinds obtainable. KELWAY AND SON have been the leading Gladiolus specialists since 1855: they have been awarded 200 Gold and Silver Medals for Gladioli, and they originated the popular LANGPRIM section (hybrids of *Primulinus*). Their fine named show varieties are offered at 6/-, 9/- and 12/- per dozen. In 12 varieties, or twelve of a sort. Free for prepaid orders of £1 and upwards. State whether Large-flowered (Kelwayi) or Langprim are required, and what colours are preferred. All are guaranteed British and are flowering bulbs.

"I always prefer your Gladioli, which I have found incomparably the best."—Mr., Leth, Edinburgh.

"Your Gladioli are quite the best we have had and prove that it is a better proposition to buy in England. Hitherto we have purchased from Holland, and with sending C.W.O. have been very disappointed, especially the last lot."—Mr., Baldock. April 14, 1927.

NOW IS THE TIME TO ORDER KELWAY'S ATTRACTIVE ANTIRRHINUMS for Spring Planting.

Most satisfactory for filling gaps in Colour Schemes in Herbaceous Borders, or for beds or borders by themselves. Easily grown, hardy, free and long flowering. KELWAY & SON, The Royal Nurseries LANGPORT Established 1851

### WALLFLOWERS

The cultivation of the Wallflower was revolutionised when we introduced the orange-scarlet varieties, and we strongly recommend flower lovers to try the following:—

## WILLIS BROS. Garden Fertiliser

**THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1-cwt., 15/-; 1/2-cwt., 9/-; 28lb., 5/-; £14 10/- per ton. All Carriage Paid.

**LOOK TO YOUR VINES!**  
The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56lb., 14/-; 28lb., 8/-; All Carriage Paid.

**LAWN MANURE.**  
Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton, £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

**LAWN SAND AND DAISY KILLER.**  
This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.  
**DIRECTIONS FOR USE.**—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

**SUSSEX TRUG BASKETS.**  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

**GARDEN SUPPLIES AT LOWEST PRICES**  
Write for our List of Garden Manures and Horticultural Sundries. Free on application.

**WILLIS Bros. (HARPENDEN) Ltd.**

# FERNS AND FERN CULTURE

By J. BIRKENHEAD.

Revised by F. Parsons.

PRICE 1/4 POST FREE

Ferns ought to play a much larger rôle than they do in the English garden. There are so many places where, in consequence of shade cast by tall trees or high walls, flowers needing sunshine will not thrive, and where Ferns, on the contrary, would luxuriate, given only sufficient moisture.

Ferns have a grace and dignity all their own, and can redeem by their beauty what would otherwise be a bare and unattractive corner of the garden. Those wishing to cultivate them cannot do better than purchase the little book whose title appears above.

*It can be obtained from:*

**THE GARDENERS' CHRONICLE LTD., 5, TAVISTOCK STREET, LONDON, W.C.2.**

## SUPPLEMENTARY PLATE.

Cydonia cathayensis.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 52°.

## ACTUAL TEMPERATURE—

The *Gardeners' Chronicle* Office, 5, Tavistock Street, Covent Garden, London, Wednesday, May 4 10 a.m. Bar. 29.9. Temp. 65°. Weather, Sunny.

THE severe frosts which occurred in many parts of the country during the closing days of April have, we fear, severely reduced the prospects of a bountiful harvest of fruit. The opened buds of Apple blossom were frozen through to such an extent that the stigma within was blackened, while embryo Plums, and in some cases Gooseberries, fell to the ground after experiencing several nights of frost ranging from 3° at Bodnant to 19° at Edinburgh, and from 9° to 13° around London. In the county of Kent frosts were very severe, and we learn through Mr. E. A. Bunyard and Mr. F. W. Ladds that the splendid prospects of a bountiful fruit harvest have been reduced to a minimum. From south Hampshire, from Reading and from the Swanwick Strawberry district come similar tales of woe, while in the famed Vale of Evesham the cold weather has done irreparable harm to crops. It is too early yet to estimate the damage done and its effect upon the fruit industry as a whole, but the pessimistic strain in which so many correspondents have written is particularly ominous.

We learn of acres of newly planted early-flowering Chrysanthemums being killed and of thousands of Marguerites utterly spoiled for market purposes by the severity of the weather. The night frosts of April 27, 28 and 29 laid a heavy hand on many of the Rhododendron species at Kew, both in the vicinity of King William's Temple and in the Museum garden, where Rhododendrons are successfully used as a ground cover for Lilies. The damage seems to be confined to the species which have been throwing out new growth of late, and although April has been consistently cold and not conducive to precocious growth, none of these seems to have escaped. On the other hand, species like *R. neriflorum*, *R. auriculatum* and *R. discolor*, among others, which do not make a move yet, have not been harmed. Had April been a warm month, the damage would doubtless have been even more severe; as it is, the condition of the plants is clear evidence of the risks planters run. The list of casualties is too long for individual mention, but includes well-known species like *R. Souliei*, *R. Williamsianum*, *R. rubiginosum*, *R. oreotrephes*, *R. strigillosum* and *R. irroratum*, as well as several such as *R. Watsonii*, of which the constitutional hardiness is doubtful, apart from any question of vernal growth. The damage at Kew is not, unfortunately, confined to Rhododendrons.

Mr. E. Beckett, V.M.H., writes that: "The frosts registered at Aldenham from April 27 to May 2, were 15°, 13°, 4°, 13°, 17° and 2°, respectively, and the pitiful effect of the cold nights is especially noticeable on shrubs. Young growths of Roses are wilted beyond recovery, as are those of Hydrangeas, *Diervillas*, *Deutzias* and *Viburnums*. *Cercidiphyllum japonicum* looks as though a bonfire had been lit beneath it; Japanese and Chinese Maples are in a similar plight, and a bed of Azaleas that is a particular joy each season is now hopeless, with the flower buds killed completely, a fate that has also overtaken large specimen *Magnolias*. So runs the tale of woe, which would almost fill volumes; but the sum total of damage will not be known for some time to come. Even Gunneras that had been covered in the usual way were damaged, despite the protection afforded them. A very serious aspect of this severely cold spell is its effect on the fruit crops; there was a magnificent show of blossom, but the frosts have quite spoiled the prospects, for on examining flowers and even small, unopened buds, we found the stigmas dead and black, so that only in the very sheltered portions of Apple and Plum trees are we likely to find fruits eventually maturing. Alas! all this is apart from the severe check the trees have suffered. Never, in the course of my experience, have I known such damage, for even the young Strawberries leaves are shrivelled up as if by fire. There arises but one small consoling thought, and it is that the ground itself was very much on the dry side. Had the soil been moist when these frosts overtook us, where to-day there are scores of casualties, there would probably have been thousands of infinitely worse cases, and while we bemoan the present serious damage, it is as well to remember there might have been absolute disaster."

**Chelsea Show.**—This year, Chelsea show will be held on Wednesday, Thursday and Friday, May 25, 26 and 27. On the first day, Wednesday, May 25, there will be a private view for Fellows and their friends from 9 a.m. to 12 noon. Only Fellows' and Associates' tickets will admit to the private view, but transferable as well as non-transferable tickets may be used. There will be no admission by payment on Wednesday,

May 25 until 12 noon, when the show will be opened to the public. Those who propose to submit new or rare plants to the Committees for certificate should remember that the Committees will not meet on the first day of the show, but at 6 p.m. on the previous evening. All plants, etc., for certificate must be entered with the Secretaries of the respective Committees by 5.30 p.m. on Tuesday, May 24, and they will be in attendance to receive entries throughout the afternoon. Vans will not be admitted to the show grounds on Tuesday, May 24, after 3 p.m.

**Royal Gardeners' Orphan Fund.**—We would remind our readers that the Annual Festival Dinner of the above deserving gardening charity is to be held at the Hotel Victoria, Northumberland Avenue, London, on Friday, May 20, next, when Sir Henry Whitehead, of Stagenhoe Park, Welwyn, will preside. Donations to the Chairman's list, no matter how small, will be welcomed, and should be addressed to the Secretary of the Fund at 19, Bedford Chambers, Covent Garden, London, W.C. 2.

**Hungarian Import Tax on Azaleas.**—A tax of 200 Goldkronen per 100 kilos is charged on Azaleas, Rhododendrons, etc. (even without buds or flowers) imported into Hungary; this works out, roughly, at about one to four shillings per plant, according to size. In these circumstances exporters find it almost impossible to send their plants to Hungary.

**Tulip Show at Wakefield.**—The ninety-first annual exhibition of the Wakefield and North of England Tulip Society (established in 1836) will be held at the Brunswick Hotel, Wakefield, on Saturday, May 21, and the three following days, and will be open to ticket holders at 1 p.m.

**A Rhododendron Association.**—On Tuesday last, a meeting was held in the R.H.S. Lecture Room at 4 p.m., for the purpose of forming a new Society in the interests of the Rhododendron. The meeting was well attended; Mr. Lionel de Rothschild occupied the chair, and among those present we noticed Mr. W. J. Bean, Sir Frederick Moore, Mr. P. C. M. Veitch, Mr. R. Cory, Mr. A. Grove, Mr. W. E. Wallace, Mr. G. Waterer, Mr. G. Loder, Mr. P. D. Williams, Mr. J. C. Williams, Mr. Eley, the Hon. H. D. McLaren, Sir Herbert Maxwell, Mr. A. D. Cotton, Dr. A. Hill and Lord Headfort. Mr. Rothschild stated that there already existed a Rhododendron Society composed of some twenty-five persons interested in Rhododendrons, but that Society was more in the nature of a club, it was now considered desirable to invite a larger number to take part in the organising of Rhododendron shows and for banding themselves in a cult. It was not proposed to disband the present Rhododendron Society, but he felt sure that with a stronger association the exhibitions would be even more successful than in the past, and he hoped in the future they would be of a sufficient size to fill the new hall. Mr. Gerald Loder, in supporting Mr. Rothschild, considered the time had come to form a larger body interested in the Rhododendron, and the meeting was especially called to consider what its functions should be and how the shows should be best conducted. It might be possible, he said, to hold two shows, one in the spring and one in the summer. He recommended that a small Committee should be appointed to consider details. Other speakers included Sir Herbert Maxwell, Mr. P. C. M. Veitch, Mr. Crosfield, Mr. Gomer Waterer, Mr. R. W. Wallace, Mr. J. Cheal and Mr. J. C. Williams. All were unanimous in supporting the proposal, and the chairman put the following resolution to the meeting, which was carried unanimously: "That this meeting is of opinion that an association be formed to be called the Rhododendron Association, for the purpose of promoting the cultivation of Rhododendrons, and that a Committee be formed to consider details and report to a further meeting to be held toward the end of June." On the proposition of Mr. J. C. Williams, a Committee of six was appointed, three from the existing

**Rhododendron Society**—Messrs. Rothschild, McLaren and Stephenson, and Messrs. Gerner Waterer, Crosfield and Admiral Walker-Heneage-Vivian. The Committee, which was given power to co-opt others, will draw up concrete proposals and report to a further meeting to be called at the end of June.

**Gardens and Queen Alexandra's Memorial.**—Owners of many of the most important gardens in England and Wales have consented to allow the public to inspect their gardens at a fee varying from 1s. to 2s. 6d. in aid of the National Memorial to Queen Alexandra, which will take the form of a visible memorial to be erected on a site adjacent to Marlborough House and facing Friary Court, St. James' Palace, and a fund for extending the work carried on by the Queen Victoria Jubilee Institute for nurses. The visible memorial will be a group in bronze executed by Mr. Alfred Gilbert, typifying Faith, Hope and Charity, as virtues closely identified with the late Queen; it will be erected in a recess of a portion of the garden wall on the site referred to. The great majority of the gardens will be open for inspection in June, although a few may be visited this month and a few others in July, and they will be thrown open between the hours of 11 a.m. and 7 p.m. Gardens in practically every county are included in the scheme. A full list may be had on application to the Hon. Secretary, Mr. F. H. Mitchell, 28, Windsor House, Victoria Street, S.W.1.

**Lilium longiflorum var. sinense.**—Blooms of this wonderfully fine form of *L. longiflorum* were brought to our office a few days ago by Mr. A. Dimmock, who informed us that the bulbs were originally obtained by the collectors of the Yokohama Nursery Company in an entirely new locality in Western China. Neither bulbs nor plants show any signs of disease; indeed, the specimens we saw were particularly robust, and green-stemmed, the flowers being of unusually large size, pure white, and of splendid texture. We learn that comparatively few bulbs of this fine variety have reached this country, although certain American growers for market have cultivated it for some while. As it surpasses any *L. longiflorum* on the market at present, and flowers early, it is unlikely that British growers will overlook the merits of *L. longiflorum* var. *sinense*.

**Horticultural Exhibition at Leicester.**—A horticultural exhibition is to be held at Leicester on Friday and Saturday, June 10 and 11, in connection with the Leicestershire Agricultural Society's show. The special classes are for a group of miscellaneous plants; a collection of hardy perennial plants and cut blooms (Roses and shrubs excluded), arranged on a space not exceeding thirty feet by nine feet; a collection of Sweet Peas arranged on a space of twenty feet by four feet; and a collection of cut Roses to occupy an area sixteen feet by four feet. Mr. Peter Blair, Trentham, Stoke-on-Trent, is Secretary of the Horticultural Section.

**Experiments with Vita Glass.**—The first "lap" of the race between two sets of seeds and plants at the Royal Botanic Gardens, Kew, has ended in a victory by twenty-four hours for those grown under the new glass which admits the ultra-violet rays of the sun. Six weeks ago, a selection of typical seeds and plants was duplicated in one of the glasshouses at Kew, one half of which was glazed with ordinary glass and the other with Vita glass. So far, the test has shown that the seeds under the new glass germinated twenty-four hours in advance of the others, and that after three weeks their plant companions, most noticeably the young Lettuces, are of a deeper green and far sturdier growth than those grown beneath ordinary glass, which gave a temperature from 2° to 6° lower than the other.

**Association of Economic Biologists.**—The next meeting of the Association will be held at 2.30 p.m. on May 13, at the Imperial College (Botany Department, Prince Consort Road), South Kensington, when the subject for discussion will be: "Plant Alkaloids." Lieut.-Col. A. T. Gage, C.I.E., lately Director, Botanical

Survey of India, and Superintendent, Royal Botanic Gardens, Calcutta, will lecture on "The Principal Plants yielding Alkaloids"; Dr. T. A. Henry, Director, The Wellcome Chemical Research Laboratories, will read a paper on "The Biochemistry of the Alkaloids," while "The Medical Aspects of the Alkaloids" will be dealt with by Dr. J. Trevan, The Wellcome Physiological Research Laboratories. Students of Biology are cordially invited. The June meeting of the Association will be held on the 17th and 18th at the South-Eastern Agricultural College, Wye.

**Mr. David C. Cuthbertson.**—Mr. David C. Cuthbertson, younger son of Mr. William Cuthbertson, J.P., V.M.H., of Messrs. Dobbie and Co., Ltd., Edinburgh, is a well-known figure in the horticultural world, although he is a comparatively young man. His wedding took place in East Trinity Church, Aberdeen, on April 21, to Miss Bessie Kerr, A.R.A.M., a daughter of ex-Baillie Kerr, of Messrs. Charles Raeburn and Co., Banff. She is well-known

MR. DAVID C. CUTHBERTSON.

in musical circles in London and has frequently sung at the Queen's Hall and other important concerts. Mr. David Cuthbertson was educated at George Watson's College, one of Edinburgh's most famous schools, and on leaving there at the age of eighteen, he immediately joined the army and received a commission in the Royal Scots Regiment. This was shortly after the outbreak of war. After a period in the Royal Scots he was transferred to the Heavy Artillery Mechanical Transport, and served therein until the cessation of hostilities. He was awarded the M.C. for his services in the army. When demobilised, Mr. David Cuthbertson joined his father's firm, although it had been his intention to pursue a scientific career and to study at Edinburgh University, but the war upset this arrangement. He subsequently took control of the seed Potato department of Messrs. Dobbie and Co., and was appointed a Director of the company about three years ago. He has made a very close study of the Potato, and his paper on "The Relation of Leaf and other Diseases of the Potato to the Crop," contributed to the *Journal of the Royal Horticultural Society*, Vol. L., Part 1, profusely illustrated by photographs of his own taking, is evidence of his thorough knowledge of the subject. He is now recognised as an authority upon matters appertaining to the Potato, and is a member of the Potato Synonyms Committee of the Board of Agriculture of Scotland. He has also devoted considerable attention to the Sweet Pea. At the great shows throughout the country, and particularly in London, he has on many occasions evinced his skill as an exhibitor, and many of

the exhibits staged by him have been notable for their originality of design. He is well-known and greatly esteemed in horticultural circles, and an eloquent speaker when he can be persuaded to lecture or make a speech at a social function. His hobbies are photography, golf and music, and he is as happy at the piano rendering a difficult Beethoven sonata as when arranging a Potato or Sweet Pea exhibit. During recent years he has taken up the cultivation of the choicer new Narcissi, and has a fine collection of some of the most famous of the recent introductions. Mr. David Cuthbertson has already achieved great things in the horticultural world and, given the health and strength all his friends wish him, he should accomplish even greater things.

**Silver Cup for Paeonies.**—The second of three cups presented by Mrs. Edward Harding is offered for award in 1927 for the best exhibit of three flowers of each of six varieties of Paeonies shown by an amateur. Banksian Medals in Silver-gilt and Silver are offered by the Royal Horticultural Society as second and third prizes. The competition will take place either on June 8 or on June 21, according to the season, at the Royal Horticultural Society's Hall, Vincent Square, Westminster. The decision as to the date of the competition will be made not later than May 27, and a card will be sent to all who have written to the Secretary of the Royal Horticultural Society, asking that the notification should be sent them. Entries must reach the Secretary not later than by the first post on the Wednesday preceding the competition.

**High Hall Anemones and Narcissus Nanette.**—The High Hall strain of Anemones, to which an Award of Merit was granted by the Royal Horticultural Society on Tuesday, April 26, was shown by Mrs. Bernard, High Hall, Wimborne, and not by Messrs. Bernard, as stated in our report on page 309. We learn that *Narcissus Nanette*, to which an exhibitor's name was not attached, was shown by Mr. H. G. Longford, Bath Street, Abingdon, Berkshire.

**Frankfurt Palm Garden.**—The future of this celebrated Palm garden and grounds is still uncertain, no definite plans having yet been adopted for its administration and upkeep. It may be recalled that this establishment was one of many which suffered severely during and after the war from lack of personnel and from the difficulty of obtaining the necessary materials, chiefly fuel for heating the houses. In 1913, seventy-two gardeners and other workers were employed, at a yearly total wage of eighty thousand marks; in 1926, the annual wage-bill was only sixty-six thousand marks, and the personnel had shrunk to thirty-two. Moreover, the hours of labour having fallen from nine-and-a-half to eight per day, the actual work accomplished is even less than the number of workers would suggest. Many of the rarest and most delicate plants were lost during the difficult war and post-war period through lack of warmth; the well-kept turf in the grounds was allowed to deteriorate to the condition of a meadow, with a couple of mowings per season; indeed, such were the hindrances with which the Directors had to cope, that it was only by excellent management of their dwindled resources that they were able to carry on at all. Even at the present time, the price of heating coal is about twice what it was in 1914. Those who have the interests of the Palm Garden at heart, and who wish to see it restored to its pre-war condition, are pressing the Frankfurt Municipal authorities to take it over and maintain it out of town funds, and it is understood that this is the view of the Director, Herr Bromme. In certain circles, the suggestion has been made to convert it into a Botanic Garden; but, on the whole, the opinion is held that while Germany is well supplied with Botanic Gardens, the Frankfurt Palm Garden is in many ways unique, and is known far outside the town itself, for which, indeed, it has won a considerable repute through the foreign visitors who have seen and admired it in its pristine glory. It is suggested that an exhibition, held in the grounds, would attract many visitors and help to lighten the expense

which must, in any case, be heavy, of rebuilding the Palm house and putting the rest of the establishment in order. The exhibition was mooted some time ago, but has not yet materialised.

**Lyons Horticultural Exhibition and Fair.**—The Autumn Exhibition and Fair, which takes place every year at Lyons, France, will be held this year from November 6 to 13. It is organised jointly by the Fair Committee and the P.L.M. Railway Company. For 1928, an International Flower Show is projected, to be held from September 26 to October 4.

**Flowers for Mothers' Day.**—The Florists' Telegraph Delivery Association has made arrangements for the observance of the second Sunday in May (May 8) as Mothers' Day. During

D.A. will be represented at Chelsea Show, and its annual general meeting will be held on May 25, at which it will be reported that over 300 British florists are now members. The Annual Dinner will be held the same evening at the Holborn Restaurant, tickets 10s. 6d. each, obtainable from members of the Committee or from the Hon. Secretary, Russell Chambers, Covent Garden, W.C. 2.

**Orchids in Glasgow Public Parks.**—The accompanying illustration (Fig. 151) depicts a bank of Orchids arranged in one of the Show Houses in Tollcross Park, Glasgow. The collection shown comprised many fine spikes of *Odontoglossums* and *Cymbidiums*, *Dendrobiums* and a number of well-flowered plants of *Cypripediums* and *Lycastes*. Orchids are grown exten-

District Gardeners' Association's meeting. **TUESDAY, MAY 10:** Royal Horticultural Society's Committees meet; National Tulip Society's Show (two days); Horticultural Club's dinner and lecture at the Trocadero Restaurant, Piccadilly, W.; Jersey Gardeners' Society's meeting. **WEDNESDAY, MAY 11:** Sheffield Chrysanthemum Society's meeting. **FRIDAY, MAY 13:** Association of Economic Biologists meet; Royal Horticultural Society of Ireland meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Coelogyne Wallichii* and *maculata*.—Having stated that I conceived the first of these would be grown as freely as Crocuses, and would make beautiful winter- and autumn-flowering plants, one of your correspondents requires

FIG. 151.—ORCHIDS AT TOLLCROSS PARK, GLASGOW.

the week commencing May 2, all the British members of the F.T.D.A. were invited to arrange special Mothers' Day Window Displays. This day was instituted in America and Canada eighteen years ago and officially adopted by the British Unit last year. It has now been adopted by the florists in Austria, Belgium, Germany, Holland, Switzerland and Scandinavian countries, and has, therefore, become an international institution. The idea is to establish the custom of gifts of flowers to mothers on that day. Through its organisation, the F.T.D.A. guarantees delivery of flowers in any of the countries where it is represented, so that sons and daughters away from home may arrange with a florist for delivery of fresh flowers to their mother on May 7. One of the reasons for selecting a Sunday as Mothers' Day is that sons and daughters living at or near their parents' home may present flowers personally on that day, or if they have lost their mother they may take flowers to her grave on the Sunday. The F.T.

sively in the Glasgow parks. In Tollcross Park alone some 10,000 plants are grown, chiefly *Odontoglossums* and *Cypripediums*. The success attending their culture may be judged from the illustration. Glasgow appears to be unique in the number of winter gardens it possesses in its Parks Department, and also in the number of Orchids grown as a municipal collection. The photograph was taken just after Easter, and Mr. W. Besant, the Parks Superintendent, informs us that although the houses were packed with visitors during the Easter holidays not a single plant in the group of Orchids was damaged in any way.

**Holland County Potato Show.**—The Holland County Potato Show will be held in Spalding on October 27, 1927.

**Appointments for the Ensuing Week.**—**MONDAY, MAY 9:** United Horticultural Benefit and Provident Society's meeting; Guildford and

to know how they are grown, as hitherto he has not been successful with them. My gardener plants them in mould rather richer than that usually adopted in the culture of other terrestrial Orchids, grows them fast in a warm house, and when they go to rest they are kept nearly dry but well exposed to the sun; and I believe the two points to be attended to are to obtain a vigorous and quick growth and a long rest. The plants propagate freely. About two years ago I had good, well-established, but small, plants from Messrs. Veitch, of Exeter, and I have a good-sized pot of each, besides a few spare bulbs which have been distributed. I should observe that the leaves are very liable to scorch, and that *C. maculata* hitherto has not flowered freely, but this year the bulbs are much larger than those of last year, the soil having been enriched; the leaves of some of the plants of *C. Wallichii* are more than ten inches long and nearly four inches broad. *Dodman, Gard. Chron., May 8, 1852.*

**Rhododendron Society**—Messrs. Rothschild, Molaren and Stephenson, and Messrs. Gomer Waterer, Crossfield and Admiral Walker-Heneage-Vivian. The Committee, which was given power to co-opt others, will draw up concrete proposals and report to a further meeting to be called at the end of June.

**Gardens and Queen Alexandra's Memorial.**—Owners of many of the most important gardens in England and Wales have consented to allow the public to inspect their gardens at a fee varying from 1s. to 2s. 6d. in aid of the National Memorial to Queen Alexandra, which will take the form of a visible memorial to be erected on a site adjacent to Marlborough House and facing Friary Court, St. James' Palace, and a fund for extending the work carried on by the Queen Victoria Jubilee Institute for nurses. The visible memorial will be a group in bronze executed by Mr. Alfred Gilbert, typifying Faith, Hope and Charity, as virtues closely identified with the late Queen; it will be erected in a recess of a portion of the garden wall on the site referred to. The great majority of the gardens will be open for inspection in June, although a few may be visited this month and a few others in July, and they will be thrown open between the hours of 11 a.m. and 7 p.m. Gardens in practically every county are included in the scheme. A full list may be had on application to the Hon. Secretary, Mr. F. H. Mitchell, 28, Windsor House, Victoria Street, S.W.1.

**Lilium longiflorum var. sinense.**—Blooms of this wonderfully fine form of *L. longiflorum* were brought to our office a few days ago by Mr. A. the exhibits staged by him have been notable for their originality of design. He is well-known and greatly esteemed in horticultural circles, and an eloquent speaker when he can be persuaded to lecture or make a speech at a social function. His hobbies are photography, golf and music, and he is as happy at the piano rendering a difficult Beethoven sonata as when arranging a Potato or Sweet Pea exhibit. During recent years he has taken up the cultivation of the choicer new Narcissi, and has a fine collection of some of the most famous of the recent introductions. Mr. David Cuthbertson has already achieved great things in the horticultural world and, given the health and strength all his friends wish him, he should accomplish even greater things.

**Silver Cup for Paeonies.**—The second of three cups presented by Mrs. Edward Harding is offered for award in 1927 for the best exhibit of three flowers of each of six varieties of Paeonies shown by an amateur. Banksian Medals in Silver-gilt and Silver are offered by the Royal Horticultural Society as second and third prizes. The competition will take place either on June 8 or on June 21, according to the season, at the Royal Horticultural Society's Hall, Vincent Square, Westminster. The decision as to the date of the competition will be made not later than May 27, and a card will be sent to all who have written to the Secretary of the Royal Horticultural Society, asking that the notification should be sent them. Entries must reach the Secretary not later than by the first post on the Wednesday preceding the competition.

**High Hall Anemones and Narcissus Nanette.**—The High Hall strain of Anemones, to which an Award of Merit was granted by the Royal Horticultural Society on Tuesday, April 26, was shown by Mrs. Bernard, High Hall, Wimborne, and not by Messrs. Bernard, as stated in our report on page 309. We learn that Narcissus Nanette, to which an exhibitor's name was not attached, was shown by Mr. H. G. Longford, Bath Street, Abingdon, Berkshire.

**Frankfurt Palm Garden.**—The future of this celebrated Palm garden and grounds is still uncertain, no definite plans having yet been adopted for its administration and upkeep. It may be recalled that this establishment was one of many which suffered severely during and after the war from lack of personnel and from the difficulty of obtaining the necessary materials, chiefly fuel for heating the houses. In 1913, seventy-two gardeners and other workers were employed, at a yearly total wage of eighty thousand marks; in 1926, the annual wage-bill was only sixty-six thousand marks, and the personnel had shrunk to thirty-two. Moreover, the hours of labour having fallen from nine-and-a-half to eight per day, the actual work accomplished is even less than the number of workers would suggest. Many of the rarest and most delicate plants were lost during the difficult war and post-war period through lack of warmth; the well-kept turf in the grounds was allowed to deteriorate to the condition of a meadow, with a couple of mowings per season; indeed, such were the hindrances with which the Directors had to cope, that it was only by excellent management of their dwindled resources that they were able to carry on at all. Even at the present time, the price of heating coal is about twice what it was in 1914. Those who have the interests of the Palm Garden at heart, and who wish to see it restored to its pre-war condition, are pressing the Frankfurt Municipal authorities to take it over and maintain it out of town funds, and it is understood that this is the view of the Director, Herr Bromme. In certain circles, the suggestion has been made to convert it into a Botanic Garden; but, on the whole, the opinion is held that while Germany is well supplied with Botanic Gardens, the Frankfurt Palm Garden is in many ways unique, and is known far outside the town itself, for which, indeed, it has won a considerable repute through the foreign visitors who have seen and admired it in its pristine glory. It is suggested that an exhibition, held in the grounds, would attract many visitors and help to lighten the expense

which must, in any case, be heavy, of rebuilding the Palm house and putting the rest of the establishment in order. The exhibition was mooted some time ago, but has not yet materialised.

**Lyons Horticultural Exhibition and Fair.**—The Autumn Exhibition and Fair, which takes place every year at Lyons, France, will be held this year from November 6 to 13. It is organised jointly by the Fair Committee and the P.L.M. Railway Company. For 1928, an International Flower Show is projected, to be held from September 26 to October 4.

**Flowers for Mothers' Day.**—The Florists' Telegraph Delivery Association has made arrangements for the observance of the second Sunday in May (May 8) as Mothers' Day. During

D.A. will be represented at Chelsea Show, and its annual general meeting will be held on May 25, at which it will be reported that over 300 British florists are now members. The Annual Dinner will be held the same evening at the Holborn Restaurant, tickets 10s. 6d. each, obtainable from members of the Committee or from the Hon. Secretary, Russell Chambers, Covent Garden, W.C. 2.

**Orchids in Glasgow Public Parks.**—The accompanying illustration (Fig. 151) depicts a bank of Orchids arranged in one of the Show Houses in Tollcross Park, Glasgow. The collection shown comprised many fine spikes of *Odontoglossums* and *Cymbidiums*, *Dendrobiums* and a number of well-flowered plants of *Cypripediums* and *Lycastes*. Orchids are grown exten-

District Gardeners' Association's meeting. **TUESDAY, MAY 10:** Royal Horticultural Society's Committees meet; National Tulip Society's Show (two days); Horticultural Club's dinner and lecture at the Trocadero Restaurant, Piccadilly, W.; Jersey Gardeners' Society's meeting. **WEDNESDAY, MAY 11:** Sheffield Chrysanthemum Society's meeting. **FRIDAY, MAY 13:** Association of Economic Biologists meet; Royal Horticultural Society of Ireland meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Coelogyne Wallichii* and *maculata*.—Having stated that I conceived the first of these would be grown as freely as *Crocuses*, and would make beautiful winter- and autumn-flowering plants, one of your correspondents requires

FIG. 151.—ORCHIDS AT TOLLCROSS PARK, GLASGOW.

the week commencing May 2, all the British members of the F.T.D.A. were invited to arrange special Mothers' Day Window Displays. This day was instituted in America and Canada eighteen years ago and officially adopted by the British Unit last year. It has now been adopted by the florists in Austria, Belgium, Germany, Holland, Switzerland and Scandinavian countries, and has, therefore, become an international institution. The idea is to establish the custom of gifts of flowers to mothers on that day. Through its organisation, the F.T.D.A. guarantees delivery of flowers in any of the countries where it is represented, so that sons and daughters away from home may arrange with a florist for delivery of fresh flowers to their mother on May 7. One of the reasons for selecting a Sunday as Mothers' Day is that sons and daughters living at or near their parents' home may present flowers personally on that day, or if they have lost their mother they may take flowers to her grave on the Sunday. The F.T.

sively in the Glasgow parks. In Tollcross Park alone some 10,000 plants are grown, chiefly *Odontoglossums* and *Cypripediums*. The success attending their culture may be judged from the illustration. Glasgow appears to be unique in the number of winter gardens it possesses in its Parks Department, and also in the number of Orchids grown as a municipal collection. The photograph was taken just after Easter, and Mr. W. Besant, the Parks Superintendent, informs us that although the houses were packed with visitors during the Easter holidays not a single plant in the group of Orchids was damaged in any way.

**Holland County Potato Show.**—The Holland County Potato Show will be held in Spalding on October 27, 1927.

**Appointments for the Ensuing Week.**—**MONDAY, MAY 9:** United Horticultural Benefit and Provident Society's meeting; Guildford and

to know how they are grown, as hitherto he has not been successful with them. My gardener plants them in mould rather richer than that usually adopted in the culture of other terrestrial Orchids, grows them fast in a warm house, and when they go to rest they are kept nearly dry but well exposed to the sun; and I believe the two points to be attended to are to obtain a vigorous and quick growth and a long rest. The plants propagate freely. About two years ago I had good, well-established, but small, plants from Messrs. Veitch, of Exeter, and I have a good-sized pot of each, besides a few spare bulbs which have been distributed. I should observe that the leaves are very liable to scorch, and that *C. maculata* hitherto has not flowered freely, but this year the bulbs are much larger than those of last year, the soil having been enriched; the leaves of some of the plants of *C. Wallichii* are more than ten inches long and nearly four inches broad. *Dodman, Gard. Chron., May 8, 1852.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Cypripediums.**—Plants that produce their flowers late in the season and are past their best should be attended to at once, should they require repotting. Plants starved for the want of new material seldom attain such vigour and health as those which have the necessary attention as they require it. When all that require it are repotted, it is advisable to cleanse them thoroughly before putting them in their growing quarters. Each plant should have room to develop its growth, and should not require attention again until the autumn when, previous to flowering, it will be the better for another cleansing.

**Maxillaria.**—The genus *Maxillaria* includes species having widely different habitats; some grow wild in the hot valleys of Brazil and Guiana, others are found in the West Indian Islands, and still others in the Andes at several thousand feet elevation, so that there is a decided difference in the temperatures they need. Amongst the best known and the most useful of these interesting plants that are commencing to grow and need attention at their roots at the present time are *M. candida*, *M. grandiflora*, *M. Mooreana*, *M. nigrescens*, *M. picta* and *M. venusta*. These species may be grown either in ordinary flower pots or shallow pans. They develop, as a rule, numerous small roots and require considerable surface space in which to ramify in the open, porous compost used for them.

**Compost.**—A mixture of *Osmunda* fibre, A.I fibre and *Sphagnum*-moss, cut into rather short portions, provides a suitable rooting-medium. The receptacles should be half-filled with drainage material, for although the plants require liberal supplies of water when they are growing actively, the roots soon perish and decay in a sour compost. Newly-potted plants should be placed in a shady position and watered very carefully until the new roots have grown freely in the fresh compost, as there is a danger of the pseudo-bulbs decaying at this stage in a wet material. Afford the plants only sufficient water to keep the moss on the surface healthy and alive, but their surroundings should be kept humid and moist until growth becomes active and roots plentiful, when liberal supplies of moisture should be afforded. Such species as *M. fucata* and its variety, *Hubschii*, *M. Sanderiana* and others which are now showing their flower spikes, should not be disturbed at the roots until the flowers have faded, when they may receive immediate attention. Owing to the flower spikes of *M. Sanderiana* and *M. Lindenii* being sometimes decumbent, the plants should be grown in teakwood baskets, with Fern rhizomes instead of crocks for drainage, to allow the flowers to push easily through the base of the receptacle. All the species mentioned succeed in an intermediate temperature, and need a humid, moist atmosphere.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Brassicas.**—So soon as seedling Brassicas are large enough, they should be pricked out into nursery beds, at a distance of about four inches apart each way. Much better results are obtained in this way than by leaving them crowded in the seed-bed, as is often the case. Keep the leaves lightly dusted with old soot as a deterrent to the fly that attacks them.

**Celery.**—So soon as the seedlings intended for the late crop are ready they should be pricked out, about three inches or four inches apart, in cold frames containing good soil, consisting

of loam, old Mushroom-bed manure, leaf-mould, and a little burnt refuse. The frame should be kept rather close for a few days and the seedlings sprayed and kept shaded in hot, sunny weather. Keep the leaves lightly dusted with old soot as a preventive against the Celery fly.

**Lettuce.**—Seeds of this salad should be sown fortnightly, in rows, in well-manured ground, which should be made firm before sowing. At this time of the year, Lettuces should be left to grow where they are sown, as transplanting gives them a severe check. Thin the rows and stir the ground with the Dutch hoe, especially during dry weather. Should the soil be very dry at the time of sowing, draw out the drills and soak the soil with water before scattering the seeds.

**Thinning Crops.**—This important work should never be neglected and ought to be done while the seedlings are small, for if the plants are allowed to become crowded they make long-necked weakly specimens, which are never satisfactory. A second thinning soon becomes necessary, and at that time it is easy to see which are the best plants to retain. Immediately after these operations, dust the seedlings with old soot, and stir the ground well with the Dutch hoe.

**Asparagus.**—Carefully cut the stalks of this vegetable daily, tie the shoots into bundles, and stand the cut ends in saucers of water until required for use. Do not cut the weak growths; these should be allowed to develop and thereby help to strengthen the crowns.

**Turnips.**—Continue to sow Turnips for successional cropping, choosing a cool site. Keep the foliage dusted with old soot, which will do much to ward off the Turnip fly, and at the same time stimulate the young plants.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockton Hall, Hertfordshire.

**Carnations.**—Young plants of Perpetual-flowering Carnations that were propagated early to produce flowers during the autumn and are now growing in three-inch pots should be ready for transferring to six-inch receptacles. If, however, it is intended to flower the plants in seven-inch pots transfer them at this stage to five-inch pots. The compost for this potting should contain a larger portion of loam than that used for the earlier potting; in fact, the only other materials I advise at this stage are sharp sand, a small quantity of old Mushroom-bed manure, and a sprinkling of Carnation manure. Now that the nights are warmer the plants may be grown in a cold pit or frame in a sunny position. The frame should be shaded from bright sunshine until the young plants have become established in the new soil, and water should be applied sparingly, for if the soil becomes sour before the young roots are active the plants will not succeed. A small stick should be placed to each plant to keep the young growths upright. Watch carefully for aphids and on its first appearance take means to destroy the pest by fumigating the plants with XL All insecticide.

**Primula obconica.**—This *Primula* has been greatly improved during the past few years, and seeds of a good strain should be sown in six-inch pots. The receptacles should be well-drained, filled with light soil, and kept in a warm greenhouse until the seedlings appear. The seeds are somewhat slow in germinating, and care must be taken to prevent the soil becoming dry, for which reason it should be shaded from bright sunshine. Prick off the young plants so soon as they can be handled, and stand them near the roof-glass in a cool pit or frame. Transfer them to small pots later, and when these are well filled with roots they should be placed in receptacles five inches or six inches in diameter, in which they will flower. A cold frame will suit them admirably; admit air to the frame freely. The compost for the final potting may consist chiefly of

good fibrous loam with one part leaf-mould and a little dry cow manure, adding sand to ensure a free passage of water. This *Primula* enjoys frequent applications of liquid manure when commencing to flower.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Plums.**—The fruits are swelling freely and should be well-thinned with a pair of scissors, retaining those for preference where there are plenty of leaves. As the earliest fruits have barely passed the stoning stage, mulching, feeding and syringing must be continued for a considerable time. Pure, soft water only should be used for syringing, and the syringing should be sufficient to wet all the fruits thoroughly. The appearance and quality of Plums are spoiled when the bloom is destroyed and partial wetting or light sprayings often cause spots on the fruits, whilst thorough syringing leaves the bloom intact. Grubs and aphides should be kept in check by fumigating the house on several occasions.

**Planting Young Vines.**—May is the best month for planting young vines, as solar heat supplemented by a little fire-heat produces conditions most genial to the young vines which, when planted early, have a full season for making their growth and ripening their wood. Those who have facilities for propagating vine-eyes should root them in February and have young canes ready for planting out in May or early June. If the instructions of previous calendars have been followed, home-grown vines intended for spring planting will have been transferred to pots large enough to prevent too much coiling up of the roots, as all young vines grown in pots from eyes of the current year should be planted before they become pot-bound. If the balls of earth and roots are suitably moist, they may be pressed gently just to break their solidity. The points of the roots will then fall away, and if the vines are shaded for a few days after planting, they will soon recover and reach the tops of the rafters long before the end of the season. The time to plant is when the soil of the new border, which need not exceed three feet in width, is fairly settled and warmed through. Cover the roots with fresh, warm compost reserved for the purpose. The distance to plant is a matter the grower must settle for himself, for length of rafter and the future mode of pruning and training must be taken into consideration. If the are to be trained as single rods and pruned on the short spur system, three-and-a-half feet to four feet will not be too much space. Supernumeraries intended for fruiting one year after planting are best kept out of the main border, as this method is not profitable. It is better to plant such vines against the back wall and remove them so soon as they have fulfilled their purpose. After planting is finished, each vine should be given a little warm water to settle the compost about the roots. The front ventilators should be kept close until the roots are established in the soil and the young canes growing freely. The less the top lights are opened the better for a few days, always provided the temperature does not exceed 80° to 85°. Supply the necessary moisture by lightly syringing the vines and by damping bare spaces in the vinery.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Late-planted Trees.**—Young Peach and other trees that were planted somewhat late in the season and left unpruned to allow for the soil to sink before finally securing the shoots in position should, now that the surface soil is much drier, be given attention. Tread the soil over and about the roots firmly, so that the new roots may be in close contact with the earth. If the shoots are of medium strength and breaking evenly very little pruning will be necessary, but where the shoots are long and immature, shorten them back to within

fifteen or eighteen inches of the base. Train the shoots at equal distances apart to form an evenly-balanced head. As the new growths extend, remove the superfluous ones, but preserve the best and most suitably placed young growths for extension and for furnishing bare spaces. Keep a keen watch for green and black aphides, and should these pests be detected during the early stages of growth, syringe the trees at once with a nicotine insecticide. Clean, early, healthy growth should be encouraged so as to obtain the best results. This applies to all fruit trees, but more especially to those that fruit on one-year-old shoots.

**Apricots.**—Trees that are protected by glass copings, blinds, etc., are growing freely and should be given attention both at the roots and the top growths. Pinch the shoots to encourage fruit spurs, and remove any that are ill-placed or crowded. Train in any that are required for furnishing the space or for extension. Thin the fruits early, especially where they have set in clusters, leaving those best situated and most promising to make good-sized specimens. Examine the roots and water the soil freely if it is found to be dry, this being very necessary in the case of trees growing under glass copings.

**General Remarks.**—The ground is in a favourable condition for working, and the hoe should be used freely, both for the destruction of weeds and to stir the surface, which has become hard after the heavy rains. Promoting a fine tilth will allow the sun's warmth to enter the soil and also check evaporation of moisture. In the case of heavy soils it may be necessary to fork the ground lightly instead of hoeing it.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Hardy Fernery.**—Hardy Ferns often suffer from an excess of tidiness, such as cutting off the old fronds before the young growth is well advanced. Such procedure does not add to the appearance nor conduce to the general health of the collection; indeed, it is doubtful whether it is at any time wise to remove the old fronds, as they shade the ground and help to conserve the soil moisture, which is so important for the well-being of these beautiful plants. If it is desired to remove the old foliage it should not be done until growth is well advanced, and the removal of the faded fronds should be followed by a mulch of decayed leaves. If on a large scale, the hardy fernery should be in a semi-wild condition, and in most parts of the country some degree of shade, more or less, is necessary for all but a small number of hardy Ferns. Because of this a variety of hardy bulbous and herbaceous plants may be naturalised in the fernery, the former including Scillas, Snowdrops, Chionodoxas, Cyclamens, Anemones, such as *A. spennina*, *A. blanda*, *A. Hepatica*, *A. ranunculoides* and *A. nemorosa* and its varieties. Among herbaceous plants may be mentioned Lily-of-the-Valley, *Polygonatum multiflorum* (Solomon's Seal), and other species; *Omphalodes verna*, *Asperula odorata* (Sweet Woodruff), *Myrrhis odorata* (Sweet Cicely), Primroses and ordinary Paeonies.

**Anemone coronaria.**—The many varieties of this plant, with both single and double flowers, are invaluable, not only for bedding purposes, but also for supplying cut blooms. Dry roots are commonly purchased, and where required for bedding out, this is the most convenient method of raising a stock. If, however, the plants are required to supply cut flowers, they may be raised from seeds which may now be sown out-of-doors on a border in the kitchen garden or reserve garden. To facilitate the even distribution of the seed it should be mixed with sand. Seeds may also be sown about the beginning of March, pricking the seedlings off into boxes and subsequently planting them in their flowering quarters. Anemones enjoy a rich, well-manured soil.

**Bedding Plants.**—All plants sufficiently forward should be removed to cold frames or other shelters where they may be gradually hardened. If not

already done, tuberous-rooted Begonias intended for bedding purposes should be started into growth. Continue to transplant recently-sown half-hardy annuals.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Early-flowering Chrysanthemums.**—The cuttings of these Chrysanthemums which were inserted early in March are ready for planting where they are intended to flower; they should, if hardened properly, grow away without a check. The earlier varieties, of which Craigmillar may be cited as an example, may be usefully employed for filling beds in the flower garden,

kept as hardy as possible, and have plenty of air admitted to the frames in which they are growing. The trend of modern gardening seems to be towards the cultivation of the hardier plants, and many of these may now be planted with every prospect of success. *Nepeta Mussinii*, to mention one plant, seems to have become exceedingly popular, and although not quite hardy on wet, heavy soils, it may be readily propagated by means of cuttings inserted in a cold frame in October, and such plants are now ready to be planted out. The different varieties of *Lobelia cardinalis* may, if they have been wintered under glass, be placed in their summer quarters; also *Pentstemons* rooted from cuttings inserted last autumn. The frames these plants have occupied may be used for the protection of a variety of spring-raised plants still occupying positions in the houses, and now

FIG. 152.—HYDRANGEA H. B. MAY.

R.H.S. Award of Merit, April 26. Pink, shaded with mauve. Shown by Mr. H. J. Jones.

(see p. 309).

as they come into bloom early and continue to give a bright display over a long period. The greatest value of these Chrysanthemums, however, is for use as cut flowers, and for this purpose, they are best planted in rows or blocks of one colour where they may be readily protected, if need be, from damp and, in industrial districts, from smuts and soot. The number of varieties in commerce seems endless, and while all the members of the well-known "Masse" family may be depended on to do well, a few of the newer kinds should be tried from time to time. Allow each plant ample room to develop; a space of from eighteen inches to twenty-four inches apart will be required, according to the variety; the bushy sorts will fill the larger space, and the more slender-growing varieties, such as Goacher's Crimson, will be well provided for in the lesser one.

**Bedding Out.**—Although it is too early to risk putting tender subjects in the open, all plants intended for this purpose should be

requiring additional room. Their removal to frames will allow more room for later seedlings and for the many tender subjects that are crowding each other.

**Vegetable Garden.**—Plant spring-sown Onions on the first favourable opportunity, in rich, deeply-dug ground. A quantity of wood-ash lightly-forked into the soil before planting, and a dressing of superphosphate of lime, will be of great assistance to this crop, while occasional light dressings of sulphate of ammonia or nitrate of soda given when the plants are in active growth will keep them growing vigorously. Peas requiring staking should be attended to early and more rows sown as required. Turnips may now be sown in larger quantities, and a sowing of Turnip-rooted Beet made on a sheltered border. The maincrop of Carrots should be sown immediately. Where the Carrot-fly is troublesome, spraying the plants occasionally with a strong-smelling insecticide, such as Germite, should be resorted to.

## ORCHID NOTES AND GLEANINGS.

## ODONTOGLOSSUM SYLVIA M. AGGS.

FREDERICK J. HANBURY, Esq., Brockhurst, East Grinstead (gr. Mr. Farnes), sends a fine flower of his new *Odontoglossum* named as above, and raised between *O. Amethyst*, *Glebelands* variety, and *O. Jasper*; it is of the highest quality in size, perfect form and rich colour. The broad sepals and petals, which are bright violet-purple have bluish white margins partly surrounding the coloured area and some lavender, transverse, wavy lines. The large, broadly oval lip is pure white in front and heavily marked with violet in the basal half and around the prominent yellow crest. It is one of the best *Odontoglossums* we have seen.

## ANGRAECUM.

This very interesting genus of Orchids includes many very handsome as well as many curious species with elongated spurs by which the *Angraecums* are most readily recognised by horticulturists. In habit *Angraecums* resemble the *Aerides*, having stems clothed with evergreen, leathery, distichous foliage, which, in some kinds, is regularly curved so that even when not in bloom, they are graceful plants worthy of cultivation.

The flowers are usually produced in long racemes from the leaf axils, but in others single blooms are produced. These flowers are characterised by their spreading sepals and petals and by the long and, in some cases, very slender spur. In the smaller species this spur is small but in proportion to the rest of the flower quite large and distinct. The fact that many *Angraecums* produce their blooms during the winter months, a period when choice flowers are generally scarce, considerably enhances their value, as the blooms last from six to eight weeks in perfection, and sometimes even more.

*Angraecums* thrive under precisely the same treatment as the *Aerides*, and need similar potting material. They delight in an abundance of heat and moisture whilst in growth, with less during the dull winter months. Being mostly natives of Madagascar and tropical Africa, they are best grown in the warmest house. To this rule, however, *A. falcatum* is an exception; coming from Japan it succeeds best in a lower temperature.

The smaller-growing kinds, with their drooping spikes, should be grown in small pans or baskets so that they may be suspended when in bloom.

Although many of the strong-growing species have thick, leathery foliage, this is not capable of withstanding strong sunshine, hence a shady position is desirable.

*Angraecum eburneum* is one of the most robust Orchids known; *A. hyaloides* and *A. distichum* are two of the smallest species, while the interesting *A. sesquipedale* is the largest.

Upwards of forty awards have been made by the Royal Horticultural Society to the different species and varieties placed before the Orchid Committee, and many have been figured in *The Gardeners' Chronicle*.

There is one artificially raised hybrid, *A. Veitchii*, which was shown on January 10, 1899, when it received a First Class Certificate, and the late Mr. J. Seden was granted a Silver Medal for raising it. The parents are *A. eburneum* × *A. sesquipedale*.

Among the best of the tall-growing species, *A. Ellisii*, *A. descendens*, *A. eburneum*, *A. Eichlerianum*, *A. pellucidum*, *A. pertusum*, *A. Scottianum* and the incomparable *A. sesquipedale* may be mentioned, whilst among the smaller-growing the following are all worth the attention of growers:—*A. apiculatum*, *A. articulatum*, *A. bilobum*, *A. b. Kirkii*, *A. caudatum*, *A. citratum*, *A. crenatum*, *A. distichum*, *A. Chailluanum*, *A. falcatum*, *A. fastuosum*, *A. fragrans*, *A. fuscum*, *A. Germinyanum*, *A. hyaloides*, *A. Kotschyi*, *A. Humblotii*, *A. Leonis* (syn. *A. ranthus Leonis*), and *A. modestum*. J. T. B.

## TREES AND SHRUBS.

## CYDONIA CATHAYENSIS.

(SEE SUPPLEMENTARY ILLUSTRATION.)

ALTHOUGH by no means common in this country, there are several gardens in which the large-fruited *Cydonia cathayensis* is represented by young, robust trees. It is a plant of open, irregular habit and furnished with formidable spines. The white flowers are arranged in short clusters, after the fashion of better-known species, and they are about an inch-and-a-half across. The fruits are large and may be so much as six inches long and over three inches wide, oval, and light green in colour, becoming yellowish with age, and weighty. When fruits are produced freely this tree is very attractive and it is necessary to support the branches to prevent breakage. The branch figured in the Supplementary Illustration was sent by Mr. W. H. Honess, gardener to Viscount St. Cyres, at Walhampton Court, Lymington, Hampshire, where a robust specimen now fruits regularly every season.

*Cydonia cathayensis* was so named by the late Mr. W. Botting Hemsley in *Hook. Icon.* in 1900, but the same authority described the plant under the title of *Pyrus cathayensis* in *Journ. Linn. Soc.* in 1887. In 1906 Schneider gave this species the name of *Chaenomeles cathayensis* and the American authorities now refer to it as *Chaenomeles lagenaria* var. *cathayensis*. For garden purposes, however, it will, no doubt, remain known as *Cydonia cathayensis*.

Although in cultivation for a considerable period, it is only during recent years that *Cydonia cathayensis* has become at all well-known to lovers of trees and shrubs. Dr. Henry found it in Hupeh, but never in a wild state. Mr. E. H. Wilson found it both wild and cultivated as a hedge plant in Western Hupeh, in 1907. In *Plantae Wilsonianae*, the flowers of *Chaenomeles lagenaria* are said to vary from white to scarlet, while those of *C. l. cathayensis* are described as bluish-pink. The fruits of *C. l. Wilsonii* (*Cydonia Mallardii* of *Gard. Chron.*, 1915), are stated to be golden and red. There is evidently considerable variation in the colour of flowers and fruits of *Cydonia cathayensis*.

## ERICA ARBOREA.

THIS robust-growing member of the Heath family is again in full flower and the blossoms scent the air for many yards around. The young shoots are well clothed with innumerable, small, white flowers, and the graceful, feathery foliage adds not a little to its beauty. The plant referred to is about ten feet high and a good deal more across; but for the fact that it has had to be repeatedly reduced in height owing to the position it occupies, it would have grown very much taller, as it is known to reach a height of twenty feet under favourable conditions. This native of Southern Europe is at home in our western districts, and wherever severe frosts are not experienced it should be given a trial.

## ERCILLA VOLUBILIS.

THIS beautiful Chilean plant is flowering with remarkable freedom this season. It is an evergreen climber producing short, closely-packed spikes of flowers of a greyish-pink hue. When young and growing vigorously the plant does not produce many flowers, but even then it is interesting on account of its aerial roots, by which means it is enabled to cling to a wall and reach a considerable height. When the space at its disposal has been filled, and pruning takes the form of simply shortening any straggly-growing shoots, it commences to flower freely.

The plant was formerly known by the name of *Bridgesia spicata*, after the collector Thomas Bridges who brought specimens home from South America in 1840. It was afterwards given the name of *Ercilla volubilis*. This *Ercilla* is quite hardy; never before have I observed it flowering with such freedom as it is doing here this season. A. T. H., Culzean Castle Gardens, Maybole, Ayrshire.

## ALPINE GARDEN.

## LINNAEA BOREALIS.

THE Twin-flower of our own northern woods is eclipsed in gardens by its Canadian form, *L. borealis canadensis*, or *L. b. americana*. This is more amenable to cultivation than our wildling: it is also larger in leaf, longer in its prostrate branches, and the two bell-shaped flowers which nod on their slender stems are more ample and of a rosier hue.

*L. borealis* is perfectly hardy while the Canadian form grows as freely on the warm and humid Pacific coast of British Columbia as it does in the lofty defiles of the Rockies and Selkirks.

Any free, cool, vegetable soil will suit this delightful plant, but it should be planted where it can ramble at will among lowly Ferns and other shade-loving subjects. It is never so charming as when threading its way about moss-clad boulders or over rotting tree stumps.

*L. borealis* is related to the Honeysuckles and the flowers are faintly almond-scented. A. T. J.

## FLOWER GARDEN.

## PHYTOLACCA DECANDRA.

THIS is an old garden plant yet seldom seen in borders. It is a very attractive subject in the late summer with its large spikes of closely-set berries.

It revels in a damp, heavy soil, needs no special culture, and is a plant easily propagated from seeds. Seedlings will flower in their first year, but two or three years are required to obtain full-sized plants. A good specimen will attain a height of six feet.

The flowers are somewhat inconspicuous, being of a greenish-purple colour, but the spikes of bright, black berries, which are produced at the end of practically every shoot, make amends for the insignificance of the blossoms. S. W. D.

## LUPINUS NOOTKATENSIS.

THIS neat and attractive *Lupinus* has been cultivated in our gardens for well over a century, but for some reason the plant has never been so highly appreciated as its merits warrant.

It has disappeared from most of our hardy plant catalogues and is quite unknown to many present-day hardy plant enthusiasts.

Its chief claim to attention is its earliness; it is one of the first herbaceous plants to flower, being usually in full bloom about the middle of April, long before the members of the *Polyphyllus* section come into flower. It also has attractions when just starting into growth, the young foliage being more like that of a choice stove plant, showing all shades of pink and soft red to purple, best described, perhaps, as shot silk.

When fully developed the plant only attains a height of fifteen to eighteen inches, forming a stiff, erect bush, requiring no staking. The flowers are blue with yellow reticulations.

Being anxious to procure a stock of this *Lupinus* for use as a bedding subject, several sowings were made, both of purchased and home-saved seeds, and it is evident from the resultant plants that some natural hybridization has taken place between *L. nootkatensis* and *L. polyphyllus*, for we have numbers of plants that are slightly taller than *L. nootkatensis* and of a particularly neat habit, but they have retained, to a considerable extent, the early-flowering habit that is so characteristic of *L. nootkatensis*.

*L. nootkatensis* will evidently cross with *L. polyphyllus* and provide a race of dwarf and distinct *Lupinus* that will flower in April, thereby extending the flowering period of the genus that is now of much importance for the embellishment of our parks and gardens.

One may well ask what is *L. nootkatensis*, and anyone desiring information and no little entertainment will find both in looking up the many descriptions of the plant in garden dictionaries, encyclopaedias, and books on hardy plants; it is quite evident that all, or nearly all, refer to a different plant, so that before this note was penned I obtained the assurance of Kew that the species submitted to them was the true plant. T. Hay.

Indispensable in the Garden

## THOMSON'S MANURES

On the market for over 50 years, they still hold first place for **QUALITY** and **RESULTS**. They are safe, sure and lasting. The direct result of many years' practical experience in gardening, they stand unrivalled at the present day for all Garden Crops.

Prices:—**VINE, PLANT AND VEGETABLE MANURE**—a Perfect Food—1 cwt., 30/-; 56lb. 16/-; 28lb. 9/-; 14lb. 5/-; 7lb. 3/-; tins, 1/3 and 9d.

**SPECIAL TOP DRESSING MANURE**—an excellent stimulant—56lb. 17/-; 28lb. 9/-; 14lb. 5/-; 7lb. 3/-; tins, 1/3; Carriage paid on 25 lbs. and up.

## THE WORLD'S FINEST DAHLIAS FOR BEDDING

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.——No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S., after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about 1½ feet in height.

### JANET

Award of Merit, R.H.S., after trial in their gardens at Wisley.

Rich deep apricot, with a suffusion of deep orange—a glorious colour; the individual flowers are not quite so large as those of 'Coltness Gem,' and it is of rather more dwarf habit. In freedom of bloom, upright stems carrying the flowers clear of the foliage, and general characteristics, it is a counterpart, a fine companion, to 'Coltness.'

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

#### PRICES:

COLTNESS GEM—	doz.	100
Strong plants in small pots	6/-	45/-
Strong plants in $3\frac{1}{2}$ in. pots	7/6	55/-
Extra large in 5 in. pots	12/- & 15/-	—

#### ADA, also JANET—

Strong plants in small pots	7/6	55/-
Strong plants in $3\frac{1}{2}$ in. pots	10/6	80/-
Extra strong in 5 in. pots	15/-	—

All will bloom freely this season.

## THE NATURAL ROCK GARDENS OF NICE.

THE morning of Easter Monday, April 18, of this year, was spent by me in the study of the rocks and rock plants on the eastern side of Nice. The sea, when I left my hotel at 8.30 a.m., was of the deepest blue. It is impossible for those who have never seen the Mediterranean to conceive how intense and beautiful that colour is. Overhead there was the same tint in the unclouded sky, and while the sun already reminded one by its heat of an English mid-summer day; the air was fresh and invigorating, and I forgot that seventy-five years had passed since I first looked on the sun, and upwards of fifty since I gazed for the first time on this wonderful sea, and suffered severely from mal-de-mer during a heavy storm in the Gulf of Lyons. Bending my steps eastward, I passed the boat which, all being well, should convey me in a few days to the Island of Corsica; and as it was the Festival of Easter, entered the Church of Maria sine Labe Concepta for an exercise of devotion. Then, forward. Soon the motor traffic, characteristic of the holiday season everywhere in these days, became fast and furious, and although the rule here is to drive more slowly than in Paris, it was necessary for a naturalist—obsessed with the idea that every plant and insect, every change in the rock formation, and every object of interest must be examined and recorded—to be on guard, since, for such an one it was not easy always to avoid the oncoming monster or crush himself near enough to the jagged rocks to escape injury, and avoid being run down as a nuisance to respectable people. Yet I ran the gauntlet, and returned unscathed.

It is no part of my purpose to treat in detail of the cultivated plants of Nice, or tell over again the story of its splendid Palms, of its enormous Oriental Planes, now in full flower, except where the trees in the avenues are kept closely pruned and pollarded. Nor can I here deal with the native flora as I saw it two days earlier on an excursion to Peira Cava. That merits a chapter by itself. I am concerned no more with the gardens planted and cared for by man. My chief object was and is to study the native rock flora wherever it could be seen in unkempt and uncared for condition, and thus to judge what were the plants which in modern times have spread themselves over the district, established themselves in the various localities, adapted themselves to the different soils, and now give colour and beauty to the landscape as well as interest and perplexity to the nature-student.

Here Nature has laid out her rock gardens on a most generous scale. It is given only to few to imitate her magnificent and care-free grandeur. The volcanic formations seem to hold open arms and court the arrival of seeds of every kind, and the plants respond in the same generous way. Some, perhaps, would find the attention arrested first by the magnificent specimens of *Opuntia*. Some of these were in fruit, but what impressed me most was the fact that many of them gave evidence of having been shorn of their cuticle. I was curious to know what enemy had done this, and after keeping careful watch for some time, discovered it to be one or more species of *Helix* with stripes or bands similar to one or two of our native snails.

As I am writing these notes in my hotel, without a single guide to the fauna and flora, or text-book of any kind, they must be looked upon in the light of a popular description rather than as a scientific discourse. Moreover, a mosquito is singing in my ear a melody which I heard so frequently half-a-century ago, that memory recalls a visit to Dr. (later Sir) Patrick Manson in Amoy, in the days when he was beginning to make clear the connection between this unpleasant insect and some of our dreaded tropical diseases.

I observed one thing with great interest. It appeared at times as if Nature had purposely selected plants of a given kind in order to show the artist the secret of the colour scheme. In one place, for example, the dominant colour was yellow, and its vivid contrast, and yet harmony with the ultramarine of sea and sky

was marvellous. We sometimes think the colours too vivid which artists employ, but that is not the case. Nature's palette contains the most vivid tints, but I think it true to say they never give offence. It is a question of perfect blending. Here we find large shrubby *Euphorbias* of three or four different species, a spiny *Genista*, a very large, bushy *Senecio*, together with many other Composites closely resembling our Dandelions and Hawkweeds, with *Potentillas*, and other well-known plants. What will be the dominant colour here in two months' time, I am unable to say, but myriads of young plants of various kinds are beginning already to show that they

search in the rock gardens I found but one small annelid, a *Microcolex* less than an inch in length; so that Nature is not at present aided in her tasks here by these useful garden auxiliaries. She has, however, other helpers, in the way of insects of many kinds, whose pleasing task it is to visit the blossoms, and carry the pollen from flower to flower. Some of these insects I have secured for study under more favourable conditions.

And now it remains to mention some of the other plants which abound among the rocks and thrive in many a crook and cranny where to all appearance the foothold is precarious, and

FIG. 153.—BURRAGEARA WINDSOB.

R.H.S. Certificate of Appreciation, April 26. Flowers white and rose. Parentage: *Oncidioda Cooksoniae* × *Odontonia Firminii*. Shown by Messrs. Black and Flory. (see p. 309).

mean to make a good fight for a place in the sun when they have reached the necessary age.

I have named only the more showy yellow plants in bloom. In other places red or blue predominates. There is the *Hibiscus* with its fragile-looking petals and golden head, and a well-known succulent plant whose name I cannot for the moment recall, with flowers of a similar size and not too widely different from it in colour. Then the Labiates and Borage-worts abound, and these are usually some shade of blue or purple. The soil, where any is to be found, is stiff, dry, difficult to work, and lacking in tilth. I am writing, of course, of the wild, uncultivated spots; and these contain no worms! During a whole morning's

the amount of available nutriment small. Here is an *Erigeron*, with a pale-flowered fumitory for neighbour. A purple-headed Clover with large, strong, trifoliate leaves, rubs shoulders with two or three Vetchlings. A Daisy-like plant which abounds in places closely resembles, if it is not identical with the pretty rambling form now so popular in our rock gardens at home, known as the Mexican Daisy. The wild Thyme, the small *Iberis* or Candytuft now used for borders, with sundry Stork's Bills, Sedums, Wormwoods and *Linarias* are also in flower or even in fruit.

I have said nothing of the shrubs, as a large proportion of these are found everywhere on the sides of the mountains. *Hilderic Friend*.

**EDITORIAL NOTICES.**

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Editors and Publisher.**—Our correspondents would oblige by delaying in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand." or by telephone, to Gerrard, 1543.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**THE PROBLEM OF BOLTING.**

THE phenomenon of "bolting" is often a source of trouble to horticulturists. Broadly speaking, the term applies to those cases in which a biennial plant in the first year of growth instead of producing a normal, vigorous vegetative growth and yielding a normal quantity of stem and foliage (or their botanical equivalents) plentifully supplied with reserve products, employs itself in producing an inflorescence, with the result that a fibrous growth takes place, and the economic value of the plant is lost. Familiar cases of the phenomenon occur in the Brassicas generally, in Onions, Lettuces, and in a very marked degree in the Beet family—garden Beet, the Mangel and the Sugar-beet.

Very little scientific knowledge on the subject of the cause of this phenomenon exists. The monocarpic habit which seems to accompany bolting has been recognised in many species of plants other than annuals and biennials. One of the striking instances is that of the Bamboo, many individuals of which only flower once in a generation and then die. It is curious that in this case the phenomenon sometimes occurs over large areas simultaneously. Thus, in India, it is a native belief that Bamboos providentially flower in a year of famine, so that their seeds may be available as human food. Here, again, the phenomenon is obscure scientifically.

In regard to some of the domestic plants, such as Beet, there is some reason to believe that certain "strains" are less liable to bolt than others; in other words, there may be genetic influences at play. But, on the other hand, the phenomenon is undoubtedly often due to purely environmental causes. Early sowing, for example, seems to stimulate bolting. The first problem for the scientist to settle is, undoubtedly, to differentiate environmental from genetic causes. For example, in the case of the Mangel, is it possible by scientific methods to produce a strain which under any condition of environment will not bolt? or a strain which will only resist bolting provided time of sowing, season, etc., are reasonably normal? The geneticist might reasonably expect to find that the annual habit is a Mendelian character, either dominant or recessive to the normal habit; if it should prove to be the former, the task of isolating a pure non-bolting line is comparatively easy; if the latter, the problem, though more difficult, is still soluble. But some work reported by Vilmorin\* suggests the presence of some

complication, at least, so far as Sugar-beet is concerned, for, in the case of that plant, the bolting habit either is at times dominant and at times recessive, or it is not a Mendelian character at all. An Italian worker on the bolting of Sugar-beet (Munerati—Experiment Station, Modena) indeed, comes to the conclusion that the operative factor is solely environment. Undoubtedly, in the wild plant (*Beta maritima*) forms, varying from an annual to a perennial habit are found, whereas, as we know, the domestic forms of Beet are predominantly biennial.

Again, if one were to reason on the analogy of earliness or lateness of flowering in the cereals, definitely genetic differences might well exist. One should, also, in this connection recall Bateson's work on rogues in *Pisum*. The rogue

**LORD ANSON'S BLUE PEA.**

*LATHYRUS NERVOSUS*.

FOR many years plant lovers have desired to see the so-called "Blue Pea" in cultivation. Although the date of its first introduction is given as 1744, it appears to have always been scarce, and it is certain that very few living horticulturists have seen this plant in cultivation. At last, after many years, a plant is now flowering at Kew—the only survivor of several planted out last season in various positions. The plant in question was raised from seeds received in April, 1926, and was planted out at the foot of the south wall of one of the plant houses.

Kew is indebted to Mr. T. Hay, Superinten-

FIG. 154.—LORD ANSON'S PEA: *LATHYRUS NERVOSUS*.

character in this case is so interwoven in the tissue of the plant (in chimera fashion) that it cannot be got rid of by the classical genetic methods.

Then, on the physiological side, it would be interesting to know what are the physico-chemical conditions that accompany the switch over from purely vegetative growth to flower and fruit production. This is a problem, of course, which intrigues the fruit grower. It is being attacked at Long Ashton and East Malling, but, so far, with little success.

We understand that shortly before his death, Bateson was engaged on studying bolting in many families of plants. It would be interesting to learn whether the results of his investigations will ever be published, and whether they throw any light on a matter which is of considerable economic importance, while, from a scientific point of view, it is still sufficiently obscure. A. B. B.

dent of Hyde Park, for the seeds of this plant. Discussing the re-introduction of this and other plants with Mr. F. Stewart Sandeman, The Laws, Kingennie, Forfarshire, he found that Mr. Sandeman had a correspondent at Puerto Deseado (Port Desire), Argentine Republic, one of the known localities of this plant. Mr. Hay had a painting made from the figure in Sweet's *British Flower Garden*, which painting Mr. Sandeman forwarded to his correspondent, Mr. Robert Littlejohn, who sent a quantity of seeds by return post. He described the plant as growing near Port Desire, usually in crevices amongst rocks.

The plant flowering at Kew agrees in every respect with the herbarium specimens and the various published figures of it, with the exception of the colour of the flowers, but in that respect the species may be variable, as none of the published figures is exactly alike in colour. In the Kew plant the unopened flower-buds

\* (1) *L'Hérédité chez La Betterave Cultivée*. Vilmorin, Paris, 1923.

are a deep purplish blue; in the fully-expanded flower, which is about one inch in diameter this colour is retained more or less on the outside of the standard, the inner side being pale blue. The wings, which meet overhead in a wide arch, are almost white, tinted with blue; the keel is of the same colour. The flowers are sweetly-scented, there being four to five on a raceme.

The stems of the Kew plant have so far attained a height of two feet, and are more or less three-angled. The extremely large, broad stipules are sagittate; the leaves are broadly ovate with a mucronate point. Both stipules and leaves are very distinctly nerved, the nerves being specially prominent in the dried specimens.

It is very doubtful whether this plant will ever be commonly cultivated, judging from the fact that numbers of plants have died in the open, as well as a number grown in large pots in a cool greenhouse, which would indicate that the species requires some particular condition or conditions. In this connection we must remem-

ber from Cape Horn by Lord Anson's cook, when he passed that Cape, where these Peas were a great relief to the sailors." According to the Rev. C. Wolley Dod (*Gard. Chron.*, Aug. 18, 1900, p. 135), it must have been at Port St. Julian, in southern Patagonia, that it was obtained. Type-specimens of *Pisum americanum*, Mill., cultivated in the Chelsea Botanic Garden, are in the British Museum Herbarium. They are *Lathyrus nervosus*, Lam., which was described in 1786 from herbarium specimens collected by Commerson among rocks at Montevideo. The first mention of the name "Lord Anson's Pea," was in Aiton's *Hort. Kew*, Ed. 2, iv, 309 (1812), where the date of introduction is given as 1744, and the species (*Pisum americanum*) was erroneously reduced to *Lathyrus magellanicus*, Lam.

It was re-introduced "from the Brazils" in 1834, when it was raised by the Birmingham Botanical and Horticultural Society, and was described in 1839 as a new species, *Lathyrus Armitageanus*, Knowles and Westc. (*Floral*

Lord Anson's Pea, for which he accepted the name *L. magellanicus*, flowering in a garden in Cheshire in 1899 (*Gard. Chron.*, Aug. 11, 1900, 114). In the following year the late Mr. James Britten examined the type-specimens of *Pisum americanum*, Mill., in the British Museum and reduced that species to *Lathyrus nervosus*, instead of to *L. magellanicus* (*Journ. Bot.*, 1901, 97).

The history of Lord Anson's Pea (*L. nervosus*) under cultivation may be summarised as follows:

1744. Introduced from Port St. Julian, S. Patagonia, and cultivated in the Chelsea Botanic Garden as *Pisum caule angulato procumbente*, etc., and named *Pisum americanum* in 1768.

1834. Re-introduced into cultivation from "the Brazils" (probably Uruguay) through Mr. Charles Cope.

1839, or earlier. Re-introduced from "Puerto Bravo" in South Brazil (probably Uruguay) by Tweedie, who sent seeds to the sixth Duke of Bedford (d. 1839).

FIG. 156.—ODONTIODA TITIAN.

R.H.S. First-Class Certificate, April 26. Flowers ruby-red, flecked with white. Shown by Mr. J. J. Bolton, Claygate.

ber it is a maritime plant, and many of these are by no means happy under cultivation; it would, therefore, be interesting to learn how other cultivators to whom Mr. Sandeman and Mr. Hay distributed seeds have succeeded with it.

Seeds of the "Blue Pea" are frequently offered, but they are usually *Lathyrus sativus*, the Chickling Vetch, a native of Europe, an annual plant with blue flowers.

The following notes give the known history, geographical distribution and garden history of *Lathyrus nervosus* :—

**LORD ANSON'S PEA** (*LATHYRUS NERVOSUS*, LAM.).

The first mention which we have of this Pea is in Miller's *Gardeners' Dictionary*, Ed. 7 (1759), as "Cape Horn Pea," No. 5, *Pisum caule angulato procumbente, foliis inferioribus lanceolatis acute dentatis, summis sagittatis*. In Ed. 8 (1768) Miller gave it the binary name, *Pisum americanum*. He stated that it "was brought

Cabinet, iii, 81, t. 110). In the meantime, however, it was identified erroneously with *L. magellanicus*, Lam., by David Don, in 1836, and figured under that name in Sweet's *British Flower Garden*, Ser. 2, iv, t. 344, with *L. Armitageanus* and *Pisum americanum* as synonyms. A few years later the species was re-introduced, this time "from Puerto Bravo in south Brazil," whence seeds were sent to the sixth Duke of Bedford, by Tweedie, and was correctly identified by Hooker as *Lathyrus nervosus*, Lam. (*Bot. Mag.*, t. 3987; 1842). It was figured as *L. magellanicus* by Lemaire in *L'Horticulteur Universel*, iv, 39 (1842).

Bentham (*Mart. Fl. Bras.*, xv, pars. 1, 115; 1859), distinguished it from *L. magellanicus* and put the synonymy straight, except that he did not mention *Pisum americanum*, Mill.

*L. nervosus* was cultivated in the Trinity College Botanic Garden, Dublin, in 1892, but was named *L. magellanicus* owing to Bentham's work on the two species having been overlooked.

The Rev. C. Wolley Dod recorded having seen

1892. Cultivated in Trinity College Botanic Gardens, Dublin, as *L. magellanicus*.

1899. Cultivated in Cheshire as *L. magellanicus*.

The geographical distribution of *L. nervosus* is as follows :—Uruguay : On the coast of the Rio de La Plata and in the interior. Argentine : Bahia Blanca, Port Desire, Port Julian, Mount Dinero (on the Chilean boundary near Cape Virgins), Lago Buenos Aires, Lago San Martin, Lago Viedma and Lago Argentino, all to the east of the Andes. Chile : Elizabeth Island, Magellan Straits.

The locality "Puerto Bravo" has not been traced. The form of the name Puerto suggests that it is in Uruguay rather than in Brazil, as "Puerto" is Spanish, "Porto" being the Portuguese equivalent. Uruguay was a province of Brazil for a short time in the early part of the nineteenth century, and specimens collected there by Sellow during the years 1821-1829 are labelled "Brazil." There seems to be no clear evidence of the occurrence of *L. nervosus* in Southern Brazil.

I wish to acknowledge the invaluable assistance received from Mr. T. A. Sprague of the Kew Herbarium in comparing the herbarium specimens with the living plant, also for collating the various references to this interesting species.

There is no record, so far as I can trace, of the true *L. magellanicus*—with which *L. nervosus* has so often been confused—ever having been in cultivation. Although it is no doubt closely related to *L. nervosus*, a large range of herbarium specimens show it to be a plant of a very different leaf-character, and with smaller flowers.

Last year, Kew received seeds from a correspondent at the Straits of Magellan of what was supposed to be *L. nervosus*; the young plants are certainly not of that species, and it is possible they may prove to be the true *L. magellanicus*. *J. Coutts, Royal Gardens, Kew.*

## GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

In my last note (page 268), I stated that a bush of *Viburnum Carlesii* which was defoliated by aphides last year was not bearing a single flower this year. So far is this from being the case that this morning I counted twenty-four clusters of expanded flowers upon it. Most of the clusters are much smaller than usual, and a casual inspection from some distance had caused me to think that the bush was flowerless.

Tits have a pernicious propensity for the honey stored in the flowers of *Rhododendron barbatum* and *R. fulgens*, cruelly disfiguring the display on both species. It is remarkable that, although the blossoms of *R. Thomsonii* and its hybrids are equally full of honey and are of a similar attractive scarlet, the tits leave them severely alone. One blue tit—*Parus caeruleus*—here has developed a corrupt taste for putty, returning continually to a pane recently repaired in the drawing-room window and picking out the putty. This is inconvenient, but one cannot be angry with such a fascinating little thief.

Another marauder is a profligate old cock pheasant which nips off and devours the bells of white *Fritillaries* on a bank under my bedroom window. He makes his breakfast on them before I can get on my boots.

Some of the *Megasea* section of *Saxifrages* are very handsome; unluckily, most of them flower so early that their panicles of bloom are apt to be disfigured by frost. One of the showiest of them, *S. Stracheyi*, seldom escapes; but is well worth growing in a cool house or frame for the beauty of its pink and white flowers. *S. ligulata* is a hardier plant, bearing some resemblance to *S. Stracheyi*. The best of the deeper-coloured species is *S. Delavayi*, which delays flowering till April and is seldom harmed, although its blossoms were destroyed by 7° of frost on May 15, 1926. The flowers are rich crimson, carried on erect spikes twelve to fifteen inches high. That which is grown in some places as *S. Beesiana* seems to be the same species.

*Berberis Aquifolium pinnata* (*Mahonia fascicularis* of De Candolle) is a fine sight in mid-April, loaded with clustered spikes of fragrant, yellow flowers. A North American plant, few gardeners seem to be acquainted with its merit, probably because in a young state it resembles the common *Mahonia*, *B. Aquifolium*. It is, indeed, no use planting it except where it has plenty of room to develop, sheltered from cutting winds, but not overhung by trees; under such conditions it attains great proportions. Ten years ago I measured a specimen in the grounds of a neighbour. One side of it had been cut hard back to clear a gravel path; another side was jammed against a Yew hedge, yet the circumference of this bush was 135 feet, and its height eighteen feet. *Berberis Darwinii*, already twenty feet high here, promises to reach similar dimensions, and a bush of *B. buxifolia* is 120 feet in circumference. Of the latter species I found, several years ago, an early-flowering variety in Lady Alice Shaw Stewart's garden

at Ardgowan. I secured a layer which has now grown into a fine bush and begins to flower in the middle of February, whereas the ordinary form delays till April. Moreover, the flowers on the early variety are showier than those of the other, and more thickly set on arching spikes. If some of the numerous species recently introduced from China develop on a similar scale, it will be a puzzle to find room for them.

My old friend, Dr. Augustine Henry, rendered good service to botany when he discovered the *Rhododendron* named after him—*R. Augustinii*. That was so long ago as 1885, and it was not till 1908 that Mr. Wilson brought seeds to this country. Among all the *Rhododendrons* that have arrived from Asia during the present century, there is none that I esteem more highly than a good form of this one. There are many forms of it inferior in colour—washy, slaty or ruddy; these should be relentlessly destroyed so soon as they show anything but periwinkle blue. Being of the *Triflorum* series, and growing very tall, it is impossible to pick off the seed vessels with a view to save the plant's strength for the following season; nor is there any occasion to do so, seeing that year after year it flowers with the utmost profusion. The best blue forms may be propagated from cuttings, which strike readily in gentle bottom heat.

*R. adenogynum* bids fair to rank high as a decorative species, for it carries well-shaped trusses of a luminous white that shines afar; while, viewed more closely, the effect is enhanced by the bright pink flower-stalks. Another merit is that it produces bloom when only a couple of feet high. *Herbert Maxwell, Monreith.*

## NOTES FROM EDINBURGH.

THE list of flowers grows apace, for the end of April is the real beginning of the flowering period in the rock garden. Lately there has been an absence of night frosts; some plants, however, have suffered slight damage and many fine blooms have been spoiled by cold, biting winds.

To the enthusiast who is ever on the look-out for something new, interesting and showy, the genus *Rhododendron* is worthy of consideration as many species are admirably suited to the rock garden, and to see these in flower for the first time is something to be remembered. The name *Rhododendron* suggests to many a shrub of large dimensions and entirely unsuitable for the rock garden, but although this, in many cases, is true, there are beautiful species which grow from a few inches high to those of a few feet in height.

The recently introduced dwarf species have brightened up the rock garden and added contrasting beauty to the innumerable subjects in flower at this season. On the slope of a high mound, *R. prostratum* is flowering beautifully. It is one of the very dwarf, creeping species, only a few inches high, and enjoys the assistance of some large stones to retain moisture about its roots. The bright, purple-red flowers are carried an inch or so above the glossy leaves, and although they droop slightly they are most attractive. It is a native of China.

Two other dwarf species, *R. repens* and *R. nivale*, are both early-flowering, the former being the gem among dwarf members of the family. Its large, dark crimson flowers attracted much attention during the end of March and the beginning of April. *R. nivale* is a native of the Himalayas and resembles a miniature *R. ponticum*, when in flower, with very small leaves. It flowered for the first time in this country in 1919, and since then has annually produced many tiny flowers at Edinburgh. *R. calostrotum* from North-east Upper Burma is from eight inches to a foot high. Of compact habit, with dark purple flowers resembling those of *R. prostratum*, it is especially beautiful. It grows best in part shade and enjoys moisture, with ample drainage. A group of *R. impletum*, a native of Yunnan, is completely covered with small blue flowers. Planted thickly, it has formed a compact mass that is very conspicuous on a low mound above the moraine.

From the steps leading to the high mounds many specimens of *R. fastigiatum* may be seen. Its small blue flowers are so numerous that they almost cover the foliage. Many strikingly beautiful plants of *R. cantabile* are in full bloom, and the rich purple flowers, encircled by dark green foliage, make a very attractive display in a shaded bay. This Chinese species is one of the best of the family. Another species, *R. russatum*, is of great beauty. It is of slow growth with flowers which resemble those of *R. cantabile* and, in addition, the dark green, glossy leaves make it worthy of being included as one of the best. Perhaps the most useful dwarf *Rhododendron* for large, showy masses is *R. racemosum*. A large group of this species is at present flowering profusely on a high mound facing south-west. From a distance it is very effective, and its floriferous branches covered with masses of pink, red-tipped flowers, are beautiful. The variety *album* is also very pretty and worth cultivating. Small plants of *R. pycnocladum* in flower commend themselves as beautiful members of this group; their dwarfness, small pink flowers and glossy leaves making them true rock garden plants. Very attractive also is *R. oresbium* from Yunnan and if afforded a moderately damp place it will give every satisfaction.

In contrast to those already mentioned, *R. chryseum* is one of the prettiest of yellow-flowering sorts. A charming group of this species is to be seen on the Erica mound, and is attractive by reason of its numerous yellow flowers. It is of dwarf, bushy habit and a native of the Tibet-Yunnan frontier. *R. flavidum*, a native of Szechuan, is noteworthy on account of its pale yellow flowers. Good specimens are now in full bloom and quite unique. Two taller species, *R. hippophaeoides* and *R. scintillans*, are useful for clothing large rock faces. They grow to a height of from two feet to three-and-a-half feet and are very pretty when in flower. The colour of the flowers varies from almost white to deep blue. *R. rigidum* may also be used for this purpose and is exceptionally pretty when showing its delicate, pink trusses.

At this season it will be interesting to watch the early-flowering of *Primula vincaeflora* and *P. Farreri*, mentioned in recent notes. By reason of their structure they are now regarded as members of the new genus *Omphalogramma*. They have expanded some beautiful flowers which do not seem to suffer any ill-effects from cold or morning frosts. *P. chionantha*, from Western China, has been flowering for three weeks. It is a graceful plant with creamy-white flowers borne on tall stems covered with golden meal. It thrives best in a damp situation and is not averse to being fed with well-decayed manure. Many plants of *P. crispata*, with slender stems of nodding, purple, flowers are much in evidence in a damp, shady situation. They produce an abundance of seeds which, if self-sown, germinate freely.

The beautiful *P. erythrocarpa* is also a shade- and moisture-loving plant valuable for its long flowering period, and should be included in every collection. *P. melanops*, from Yunnan, is not yet a common plant in gardens owing to the difficulty of obtaining seeds. The flowers are of a violet-purple colour, borne on an erect, mealy stem. The leaves are of a dark green shade, long, and tapering. This species likes a damp, well-drained situation. *P. rosea* and numerous other common species are at their best in the rock garden and by the pond side. On a very dry rock face a beautiful carpet, a yard square, of *Armeria caespitosa*, is very happy. Few leaves are visible on account of its hundreds of pale pink flowers.

*Meconopsis integrifolia* var. *brevistyla* and *M. simplicifolia* (Bailey's form) have taken advantage of the bright spells of Easter sunshine and a few individual plants have opened their first flowers. *Gentiana verna*, with its glorious blue flowers, is the only one of its family in full bloom. *Bryanthus empetrifolius*, *B. taxifolius*, *Trillium grandiflorum* and the variety *roseum*, *T. chloropetalum*, *Fritillaria Melegris* and the variety *alba*, *F. pallidiflora* and *F. Imperialis* are some other interesting subjects in full flower at this season. *A. McCutcheon.*

# Ryders

## NEW DWARF BEDDING DAHLIAS

Pot roots can be planted right away just as one plants bulbs. The plants form vigorous bushes 15 to 18 inches high. These are covered with masses of single flowers in the most beautiful Dahlia colours. The earliest of all Dahlias, and continues in beauty until frost comes. Dormant pot roots form stronger, larger, and more floriferous plants than those from cuttings. 6 for 4/3 12 for 8/- (in rich variety) carriage paid. If you have not yet received a copy of Ryders Spring List send a post card to-day to

RYDER & SON (1920) LIMITED

## NOTES FROM WISLEY.

Of all the beautiful flowering fruit trees which decorate the Wisley Gardens at the present time, few can surpass the ornamental Crab Apples in the field garden. In addition to *Pyrus floribunda* and its deeper-coloured variety, *atrosanguinea*, there are some fine specimens of the deep rose-flowered *Pyrus purpurea*. Its blooms, unlike those of *P. atrosanguinea*, do not lose their colour as they age. Other deep pink-flowered Crabs include *Pyrus Eleyi* and *P. Niedzwetzkyana*. The habit of the latter, however, is rather coarse. Darkest of all is *P. Oporto*, with large blossoms of dull crimson. Along the broad walk to the wild garden several named varieties of *P. spectabile* are in flower in company with a very old tree of *P. floribunda*, and an equally fine specimen of the Double White Cherry (*Prunus Avium* fl. pl.), while between them is a smaller tree of the semi-double, pink-flowered, *P. Cerasus Watereri*. The ground beneath these trees is carpeted with drifts of *Muscari*, *Primroses* and double *Cardamine*, among which creeping plants, such as *Claytonia sibirica* and the yellow *Viola scabriscula* are in bloom.

In the wild garden the Azaleas are about to burst into bloom and to join *Rhododendrons*, such as *R. ciliatum* and *R. rubiginosum*, which have now been in flower for some time. Plants of *Trillium grandiflorum*, *Epimedium pinnatum* and *Anemones*, such as *A. apennina*, *A. blanda*, *A. nemorosa rosea*, and *A. n. purpurea*, are also in flower in this part of the gardens, and it is interesting to record that *Narcissus triandrus* is increasing and is beginning to spread in many places almost as rapidly as *N. cyclamineus* has done.

The majority of Barberries are now in flower, and in addition to sterling sorts, such as *Berberis stenophylla* and *B. Darwinii*, which are grown chiefly on account of their flowers, there are several of the newer species which are by no means unattractive in bloom. One of the best is *B. Bergmanniae*, of which the specimen at Wisley, growing some eight or nine feet high, must be one of the largest in the country. The flowers are yellow and emit the strong and rather sickly scent which is peculiar to many Barberries and attracts large numbers of bumble bees. Other species which are handsome in flower include the white-fruited *B. pruinosa*, *B. Julianae*, with pale primrose-yellow blooms, and *B. verruculosa*. The last should make an excellent hedge plant as it is fairly compact and has fine, evergreen foliage, against which the flowers show to advantage.

Many other beautiful shrubs are in flower, such as *Halesia tetraptera*, the Snowdrop Tree, and the very spiny *Aegle sepiaria* upon which there is this year an unprecedented amount of white Orange blossom. One of the finest of all the white-flowered shrubs, however, is *Exochorda Gerdalii*. Its blooms are large and derive additional charm from the tender brown foliage. The flowering Currants in bloom include the Californian *Fuchsia* (*Ribes speciosum*), *R. Lobbii*, another *Fuchsia*-like plant, with pink petals surrounded by reflexed red sepals; and a recently introduced species (Farrer 947), with myriads of greenish-white flowers which, later, produce bright red berries.

Fragrance is provided by the flowers of *Lonicera thibetica* and *L. syringantha*, but equally sweet are the flowers of *Viburnum Carlesii* and a somewhat similar species, *V. bitchuiense*, which appears likely to exceed the former in vigour. *Viburnum utile*, another excellent shrub is also in bloom, but its flowers are almost scentless. *Cydonia Sargentii* is now one of the most arresting shrubs in the garden, while almost as conspicuous is the bright blood-red, *C. Maulei atro-sanguinea*. There are, in addition, some beautiful *Cydonia* seedlings in flower on the far side of the field garden pond, where *C. cathayensis* is in bloom. Its flowers are white, mingled with pink, but it is chiefly remarkable for its enormous fruits (see Supplementary Plate).

The most noteworthy plants in the Heath garden now are those of *Erica australis*, an extremely beautiful Heath which is blooming with the white-flowered *E. arborea alpina* and the

Spanish Heath, *E. lusitanica*. *Polygala Chamæbuxus*, which commenced to bloom so early as February, continues to flower among the Heaths in company with the pink-flowered *Andromeda polifolia* and *Phyllodoce* (syns. *Bryanthus*, *Menziesia*) *empetriformis*.

In the alpine house *Tulipa Kolpakowskyana* is in bloom. It has grass-like leaves and its scarlet perianth rolls back as the flowers age. *Ramondias* are well to the fore in this house and are represented by a number of seedlings of *R. pyrenaica* which show considerable variation; by the four-petalled *R. serbica* and its beautiful variety, *R. Nathaliae*, the lavender flowers of which are in the form of a distinct cup and lack the orange centre seen in *R. pyrenaica*. *Gentiana verna* var. *angulosa* is also in flower. It does better than the type and its brilliant blue flowers contrast well with the clear yellow of such *Buttercups* as *Ranunculus gramineus* and *R. millefoliatus*. These and other bright-hued plants such as the not quite hardy *Lithospermum oleaeifolium*, may cause one to overlook the more modest beauty of *Calypso bulbosa* (? *borealis*) a pink-flowered, hardy, terrestrial Orchid, or of *Gypsophila cerastioides*, whose white flowers are lined with purple. A pretty and fragrant dwarf shrub in this house is *Daphne rupestris*. Its variety *grandiflora*, which is free-flowering, and has larger flowers, is also in bloom. Other pretty plants in flower include *Antirrhinum sempervirens*, with cream-coloured blossoms, *Linaria oreganifolia*, the pink-flowered *Oxalis oreganum* and a number of *Androsaces*, such as the low-growing *A. villosa*, var. *arachnoidea* *superba* and *A. Salmon's* variety, which is one of the deepest pink-flowered varieties of this genus.

The banks of the rock garden pools are now overcrowded with flowers. *Primula Juliae* is blooming in large masses, while, half in the water, are flowering *Caltha polypetala* and *C. palustris flore pleno*. A beautiful white-flowered *Marsh Marigold*, *C. leptosepala*, is also in bloom. An effective colour combination is seen in a group of the mauve *Primula denticulata*, interspersed among plants of *Ranunculus Ficaria alba*, which has cream-coloured flowers. The double form of *R. Ficaria* is also here and flowering well.

Near the old alpine house is a trial of *Aubrietias* in which many varieties are making a good display. One of the brightest is *Vindictive*, with crimson flowers. The rich, purple blooms of *Magician*, of which the origin is doubtful, are also striking as are those of *Prichard's A.L.*, *Russell's Crimson* and the mauve *A. graeca*. One or two varieties, as, for example, *Lavender*, do not appear to be very happy, and this is no doubt owing to the fact that they are being grown in the open ground on the flat instead of in a wall or rock crevice.

A trial of nearly seven hundred varieties of *Gladioli* has just been planted in the new trial grounds which have been made on the site of the old vegetable quarters.

*Clematis Armandii* is now flowering well on the laboratory wall, and among other interesting plants in flower in the border at the foot is *Fritillaria lanceolata*, with a dark purple perianth, mottled with greenish yellow. The bulb becomes covered with small bulbils on account of which this species is popularly known as the Rice-root Lily. J. E. Grant White.

## APHYLLANTHES MONSPELIENSIS.

*APHYLLANTHES monspeliensis* is at once a curious and a very pretty plant, suitable for the rock garden and the wall garden. It is by no means common in cultivation, but there are some very fine clumps of it on the rock garden at Kew, which have been growing there for many years and flower freely and regularly, year after year. In general aspect *Aphyllanthes monspeliensis* looks like a small, dainty tuft of Rush, with thin, wiry leaves six to nine inches long. When out of flower, it might be mistaken for a Rush, and when in flower suggests that the rush has suffered at the hands of a practical joker, for it looks as though someone had stuck blossoms of a

Hyacinth or an *Agapanthus* on the tips of the "leaves."

The plant is a most charming sight when in full summer flower. The blossoms are about half-an-inch across; wide open, starry bells, of a clear, shining, powder-blue, very like rather wide-open Hyacinth flowers. The Rush-like "leaves" are not leaves at all, but stems. Anyone who does not know the plant, and had never seen it growing wild, or flourishing in a garden, as at Kew, might be misled by its Rush-like appearance into planting *Aphyllanthes* in a wet or boggy position. But this is far from what it likes. It requires a hot, well-drained, sunny position, for it is a native of the Mediterranean region. But it is perfectly hardy and quite easy to grow.

For some reason or other, however, it has always remained rather an uncommon plant in gardens. It does not seed very freely in cultivation, and although an easy, thrifty grower, it does not increase fast enough to allow of frequent propagation by division. Further, it does not grow wild in the popular track of plant collectors, amateur or professional, and visitors to the Mediterranean who might be gardeners, and therefore likely to get it, usually go there at a season when the *Aphyllanthes* is not in flower. I know few plants one would be less likely to locate when out of flower, unless it was well-known and one was definitely looking for it. The knowledge that it was plentiful on Mount Serrat was one reason which led me to visit that astonishing mountain on my way to Majorca, last February. Had I not known it was there and so been on the look out for it, I should quite likely have passed it over in spite of its extreme abundance. I came upon areas where it grew in thin, scrubby, grassy places, always in the most open, sunny exposures, and its splendid tussocks were there by the thousand on slopes which must be frightfully hot and parched in the summer months. The soil in which it grows is a stiff, reddish loam, and calcareous. The plants must have been a lovely sight when in flower, for they were covered with seed capsules (empty alas!), but which showed how freely they had blossomed. It was a good subject to collect, though the fine, strong roots had a firm hold on the stiff ground, and it was no easy work with pocket knives or ordinary little trowels to get them up. From the home of *Aphyllanthes* on Mount Serrat, one obtains a glorious view out across the plain below, to Barcelona and the Mediterranean. Clarence Elliott, Stevenage.

## DEFOLIATION OF THE DOUGLAS FIR.

UNTIL recently the Douglas Fir has been remarkably free from leaf diseases in this country and it is unfortunate that a fungus, *Rhabdocline Pseudotsugae*, which causes serious defoliation, has been recently introduced from North America.

This disease was first recorded from Montana, North America, in 1917, where it had been causing defoliation of the Douglas Fir since 1911. It was probably introduced into the south of Scotland in 1914, and since that time it has spread to a locality eight miles distant from the place where it was first discovered. Within the last month an outbreak of the disease has been found in Hampshire, and it is possible that, in this case, infection was derived from the original Scottish centre of the disease.

In North America the disease attacks both the green and the blue Douglas and also the intermediate form, but in this country it appears to be confined to the blue and the intermediate form. The typical blue or Colorado Douglas Fir (*Pseudotsuga glauca*) is distinguished from the green or Oregon Douglas Fir (*Pseudotsuga Douglasii*) by fairly well marked characters, but the intermediate form, often known in this country as the Fraser River variety, but more correctly referred to in America as the intermountain or dry belt form, appears to consist of a number of varieties which are intermediate in character between the green and blue species.

The name *Pseudotsuga Douglasii* var. *caesia* has been applied to one of these, but there is little doubt that several forms exist, possibly produced by hybridisation between the green and blue species. Up to the present in this country the typical green Douglas Fir has never been found attacked by the disease, but all trees possessing any trace of "blue" characters appear to be liable to infection.

Infection of the trees takes place about the middle of May. Usually only leaves of the current year are attacked, and these generally first show signs of the disease about the end of June. Purplish-brown patches appear on the leaves and the tree assumes a mottled appearance. In the blue Douglas Fir the discoloration does not generally extend over the whole of the leaf, but remains confined to one or more irregularly shaped areas, although in the intermediate forms the whole leaf usually becomes discoloured. A mycelium is developed in the leaf consisting of colourless, septate hyphae which do not pass back into the shoot. The cells of the infected area die, their contents become brown, and there is a marked decrease in starch content. About March, the hyphae become more abundant towards the lower surface of the leaf just below the two bands of stomata, and it is here that the fructifications are ultimately formed. Fructifications may also be produced on the upper surface, but this is unusual. Several apothecia or fructifications are usually formed on each leaf.

The leaves of the blue Douglas Fir generally bear more numerous fructifications, which produce a greater number of spores than those on the intermediate form; thus the blue Douglas Fir, although showing less leaf damage, is likely to prove a more serious source of infection than the intermediate form. The apothecia are brown, and elongated, at first covered by the epidermis, but later opening by a longitudinal slit disclosing an orange-coloured layer which consists of asci, containing ascospores and packing hyphae or paraphyses. The ascospores are eight in number, ovate-oblong or slightly dumb-bell shaped. When shot out of the ascus most of the spores are unicellular, and surrounded by a thick layer of mucilage, but they become two-celled before germination. Before this takes place one cell becomes dark-coloured and it is from this one that the germ-tube is developed.

The ascospores are mature in the middle of May and are shed just at the time when the buds are opening. The young leaves are infected at this stage, but the exact method of infection is unknown. In America a conical type of fructification has been described which matures in the late summer, but this has not been found up to the present in this country.

Diseased leaves usually fall in July, about fourteen months after infection. Trees have occasionally been found in March in which the needles of the previous year show no infection, while those of the year before that, were diseased. In these cases either the infected needles have remained on the tree for two years or they have become infected during their second year, but both these conditions appear to be abnormal. In the Scottish locality where the disease was first found some trees were attacked in 1921 and in every succeeding year, and each year complete defoliation of the current year's leaves took place. Since the Douglas Fir usually retains its leaves for five or six years, most of these trees were completely defoliated by the early spring of 1926, except for the infected leaves of 1925. Many of these died in 1926 and the remainder will almost certainly die this year. Some of those which were first attacked in 1922 are also dead. The branch of an infected tree examined in the summer of 1925, showed that the leaves at the base of the shoot, produced in 1921, were not infected and were still retained; those of 1922, 1923 and 1924 were infected and had fallen; those of 1925 were nearly all infected. Examination of the diseased trees almost always shows that infection has taken place every year since the first attack, and has resulted in complete defoliation each year. Wherever this has taken place for three or more years the trees are either dead or in a very serious condition. A few trees have been found in which infection has not been constant

each year, and these will probably recover if they are not again attacked. Generally, however, the disease shows no sign of becoming less active.

Accounts from the United States indicate that the course of the disease is fairly similar in that country, for it is stated there that trees that have been subject to the ravages of the fungus for several seasons are almost entirely defoliated, and either die, or rarely exist for an indefinite period, without making any perceptible growth. In Scotland, however, the disease appears to be more severe and more continuous than is usual in the United States. The one striking difference between the outbreaks in the two countries is that, while in the United States all forms of the Douglas Fir are liable to infection, in Britain only the blue and intermediate forms are attacked. This is strikingly shown in Scotland where trees of the green Douglas Fir, of which the branches interlace with those of blue Douglas Fir which are heavily infected, show no sign of the disease. This fact is of great importance for the green Douglas Fir is much more valuable as a forest tree than the blue; it is impossible to say, however, how long the former will retain its immunity in this country.

All the trees which have been attacked in this country have been from ten to fifteen years old, but it is stated that in America, trees up to thirty years old may become infected. The disease has not been found on seedlings in Great Britain, but in the United States it has caused considerable damage in forest nurseries.

In view of its very serious nature, the Forestry Commission is taking steps to stamp out the disease, wherever it is known to occur. In the case of the Hampshire outbreak, the proprietor has destroyed all the diseased trees and neighbouring susceptible trees have been sprayed with Bordeaux mixture. The spraying has been performed as a precautionary measure, as experiments carried out in nurseries in the United States have demonstrated the value of this treatment. In Scotland where much larger numbers of trees are infected, arrangements are being made for their complete destruction.

Information regarding the occurrence of the disease in any other localities is particularly desired, and it is requested that specimens of any trees believed to be infected should be sent, together with particulars as to locality, age, number of trees concerned, and any other details, to the Secretary of the Forestry Commission, 22, Grosvenor Gardens, London, S.W.1, for examination and report. *Malcolm Wilson, Consulting Mycologist to the Forestry Commission, University of Edinburgh.*

## NOTICE OF BOOKS.

### Viticulture.

IN this country the supply of home-grown Grapes, for both domestic and commercial purposes, is produced almost entirely under glass, but on the Continent and also in such countries as California, Australia and South Africa, the cultivation of the vine out-of-doors is an important industry. The Grapes produced in these countries are used not only at table, but also for wine-making and for the production of Raisins, Sultanias and Currants. In the newer countries the term Viticulture is applied to the Grape-growing industry.

An exhaustive work\* on this subject has recently appeared from the pen of Dr. A. I. Perold, Professor of Viticulture at the University of Stellenbosch, South Africa. It is intended primarily for the use of Grape-growers in California, Australia and South Africa, and every phase of the subject, from both a theoretical and practical point of view, is dealt with very thoroughly. Although the information regarding the practice of Grape-growing is not applicable to this country, the book contains much information regarding the Grape vine that should

prove of interest and assistance to students of horticulture and others interested in this important fruit-yielding plant.

After a general introduction, in which the origin of modern viticulture is stated, there follows a chapter on the external and internal morphology of the vine which describes and figures every part of the vine plant in great detail. This is succeeded by a chapter on the biology of the vine, which similarly treats of every phase in the life of the vine from the germination of the seed to the ripening of the wood and the fall of the leaf.

Under the term "Ampelography" there are two chapters, one general and the other special, which treat of the classification of the various species of *Vitis* and give detailed descriptions with figures, of all the species and varieties in cultivation, together with particulars of their structure, characters, mutual relations, distributions, culture and value as cultivated plants.

The author classifies the cultivated vines into three groups: American species, European varieties and Direct or Self-producers, the last being vines growing on their own roots and producing either wine-making or table Grapes, such as was previously the case with European kinds before the appearance of the *Phylloxera* disease. Many of the new varieties known as Direct-producers are the outcome of crosses between the American and European vines, but the ideal Direct-producer, that is, a vine capable of producing good quality Grapes for eating and wine-making, and at the same time resisting diseases and pests when grown on its own roots has yet to be obtained. Of the varieties of European Grapes described in this book, twenty-two produce white wine, and thirty-two produce red wine; and of the table varieties there are twenty white, eight red and seventeen black, most varieties having a number of synonyms.

A special chapter is devoted to the propagation of the vine, and as most vineyards now consist of grafted vines, that is to say, varieties of *Vitis vinifera* grafted on to stocks of American species, propagation by grafting is the usual method adopted, except in the case of the Direct-producers, previously referred to, which are grown on their own roots. The layering of European varieties is now seldom practised as, on their own roots, they are liable to *Phylloxera* attacks. Three systems of grafting are described, namely (1) approach; (2) by means of a detached branch or scion, and (3) by budding. When a scion is used, either cleft, crown or tongue grafting may be employed. The grafting is either done on the spot in the open, or the callused cuttings are grafted at a table, the work being divided between a number of workers. If the grafted cuttings are planted out at once the scions are tied on to the stock, but if the union is to be effected first, the tying is omitted. The latter practice is a French method, the grafted cuttings being placed in a box lined with moss or sea-grass and kept in a warm and moist atmosphere until a callus has formed and the union of the scion and stock has been effected, when they are planted out in the open. The theory of grafting is dealt with in a special chapter in which the influence of grafting on the life of the vine is discussed.

At the Cape (South Africa) there are grafted vines thirty years old that are still doing well, but the average life of grafted vines is stated to be not much longer than twenty years. It is anticipated that this period may be extended to as long as fifty years when a fuller knowledge of grafting has been acquired, but it is doubted whether grafted vines (i.e., European varieties grafted on to American stocks) will ever reach one hundred years or more, as did the ungrafted European vines before the *Phylloxera* disease devastated them. In the chapter on Vine Diseases, the term "disease" is defined as "a deviation from the plant's normal life which is harmful either to the object of the plant itself or to the object for which it is grown." Under this definition of disease are described not only fungous diseases and insect pests, but also physiological diseases caused by climatic and soil conditions. A full account of the *Phylloxera* disease is given, and the author states that, so far, the most generally applied and most

\* *A Treatise on Viticulture*, by A. I. Perold, B.A., Dr. Phil., Professor of Viticulture and Oenology at the University of Stellenbosch. pp. xi + 696, illus. London: Macmillan and Co., Ltd., 1927. Price 25/- net.

FRUITS OF CYDONIA CATHAYENSIS.

satisfactory method of dealing with this pest is by grafting on American stocks.

Under the heading "The Nutrition of the Vine," is discussed the theory and practice of manuring, as applied to vineyards.

The lengthy chapters above described occupy 508 of the 678 pages of reading matter, and the reader is then brought to the practical part of the treatise which deals with the establishment and soil cultivation of a vineyard, and with the summer and winter pruning and trellising of vines; the production of table Grapes and the preparation of various vine products, such as wine, vinegar, syrups, unfermented Grape juice, and the drying of Grapes for making Raisins, Sultanas and Currants. The production of wine being a highly intricate business, is omitted and is left to be dealt with in separate text-books on the subject.

The book concludes with a lengthy bibliography of works consulted and quoted by the author, and there is a full index of the species and varieties of vines mentioned, as well as a general index. The illustrations are numerous and have been carefully selected to illustrate the text. This work will no doubt become a standard book of reference in those countries where the growing of Grapes out-of-doors is possible, and it should also prove a valuable addition to any horticultural library. *H. Spooner.*

## A "NEW" VEGETABLE, A "NEW" SALAD AND A "NEW" FRUIT.

### THE VEGETABLE.

JUST as a "novelty" frequently has a certain antiquity, even in a seedsman's catalogue, this is none other than our old friend the Broad Bean. In Majorca lately, I had these served after the manner of the Mangetout, that is to say, whole pod and its contents; I had them in omelettes, in the making of which the Spanish cook is perhaps hard to beat; also plain boiled as a vegetable dish and as an ingredient in excellent stews, *arroz dos pobres*, *Valenciana*, etc.

Naturally, the pods were picked in a comparatively young state and were about four inches long and as thick as one's little finger, or rather more; size, however, would depend upon variety. The Bean grown there is comparatively dwarf and small and is a very important crop, judging by the hundreds of acres of it one sees about the island.

An important enemy of this crop is the giant *Orobanche*, which, according to accounts, wipes out whole fields in Southern Spain, but I only once saw a pile of this parasite which had been cleared off a field. The "black Dolphin" (*Aphis rumicis*) I only saw in scanty numbers in one place; it would not seem to be widely spread as a damaging pest.

The Broad Bean as a Mangetout may be commended for trial.

### THE SALAD.

When in the South-west of France, decision was asked whether we would prefer our Artichokes "raw or cooked"; departing from my usual habit of trying anything novel, and thinking that the uncooked would be rather hard nuts to crack, the reply *cuits* was given. However, out of some dozen-and-a-half diners, only ourselves and two others favoured the cooked ones, four in all; by the others they were eaten with evident zest. The "leaves" came off resoundingly and formed good spoons to ladle up copious dressings of oil, vinegar and chopped herbs; they were too young for "choke" to have developed, though of good size.

I may add that in Majorcan stews the young heads are frequently simply cut in four pieces and mixed in; occasionally a toughish bit of "leaf" meets the teeth, but in general the whole may be eaten satisfactorily.

Naturally, a good variety should be used; those from seedlings I have raised often partake of a Cardoon-like quality and are very hard when young. I have found that the heads produced

by offsets taken in the spring, and which are growing rapidly, produce very tender heads towards autumn. It may be noted that in Majorca, where the cultivation of the plant is extensive, it is practically always grown close to the terracing wall of stones, where, during the summer, it must have a maximum of ground heat and a minimum of moisture.

### THE FRUIT.

This will appeal solely to the lovers of the Medlar and is, in fact, the fruit of the hard, highly-astringent, late-season Perry Pear—The Rock Pear—which has been allowed to blet. In this condition it has about the same texture as the Medlar, but the flavour is quite different and characteristic, at the same time, indescribable. It would be in season in January or, perhaps, February.

The Rock Pear, by tradition, should not be used in the year it is produced, nor should its perry be drunk in the year it is made. Round the Newent region it is known as the Brown Huffcap, or simply sometimes as The Huffcap. Some years ago, apparently, some distributing nurseryman rechristened it as Burgundy, under which name it is met with on some farms. It forms a round-headed tree of no great height. Hogg and Bull described it erroneously as having an upright habit, they also alleged that the original tree existed at Cromer Pit Farm, Pendock, but this tree hardly looks so old as some that may be seen. *H. E. Durham.*

## VEGETABLE GARDEN.

### KALES.

SEEDS of these most useful spring greens may be sown about the end of April or early in May in a fairly open situation. Stir the soil with a fork to obtain a fine tilth, then draw drills about six inches wide and two inches deep, leaving a ridge of fine soil near each for filling the trench when the seeds are sown. The drills should be about six feet long; the soil at the base should be firm and made level with a small, iron rake. Sow the seeds thinly, one drill or more of each sort as required, and cover them with fine soil to the depth of about an inch. If the soil is dry water it freely. Place a label to each variety. To guard against birds, insert short sticks down each side of the rows and a few down the middle to carry an old fish net.

The seedlings will soon appear, and if the ground has become caked, stir it between the plants with a pointed stick.

Kales are usually drawn from the seed-bed and planted direct in their permanent quarters, therefore the importance of sowing thinly needs no emphasising. Unless the grower has plenty of ground at his command, it is often a problem to find a suitable place for Kales as they need firm, not over rich soil to enable them to withstand the winter. An excellent place is between rows of Peas, especially if the latter are growing north to south. The partial shade is beneficial to the young plants in giving them a good start, but the Peas should be cleared off so soon as they have finished cropping to allow the Kales to obtain plenty of sunlight and air. As the ground between the Peas will naturally be firm, a line should be stretched from end to end and holes made with a small iron crowbar. Place one plant in each hole, taking care that the roots touch the bottom. Water them, and fill the hole with soil. The plants will soon begin to grow, and the surface soil should be kept continually hoed to keep down weeds.

After the rows of Peas are cleared away, it is a good plan to fork the ground lightly, as this not only ensures a neat appearance but allows sun and air to reach the roots. The plants will thus be enabled to make strong, sturdy growth, which is necessary to enable them to survive severe weather in winter. Allow at least a yard between the rows and almost as much between each plant in the rows. By planting them well apart they will be far more likely to withstand severe weather, but, above all, select an open, sunny situation. It may be necessary

to stake the plants in exposed sites, more especially the tall-growing, Scotch type; indeed, all Kales produce better crops if they are kept growing upright and not allowed to fall about untidily. Another good place in which to grow this crop is where an old Strawberry bed has been cleared. The soil where Strawberries have been grown is usually in good heart and also firm, and when the Kales are finished the ground will be vacant at an early date for trenching or digging.

Certain varieties of Kales are not quite so hardy as others, and the tender sorts should be given the most favourable position. The tall Scotch Curled, for instance, should be considered in this respect and planted in as sheltered a position as possible, and also on ground that is well-drained. In certain districts, this Kale dies from some cause unknown; it may be from stagnant moisture at the roots, but let no one be deterred from planting it for that reason, as it is one of the best of Kales and very productive.

Perhaps the hardiest of all is the Russian Kale, with greyish-green, finely-cut foliage; it is certainly one of the best sorts from a table point of view. The Labrador Kale is also very hardy, a strong-grower and of splendid flavour. Other varieties include the Cottagers' Kale, Asparagus Kale and the Purple and White Sprouting Kales; the two last give a tremendous quantity of produce, if well-grown. Whichever types of Kale are selected, they are always much appreciated, as Kales come into use just when Brussels Sprouts are getting past their best. It is better to grow a row or two of each than too many of one kind as some are perhaps earlier than others. In any case, the object should always be to produce strong, sturdy plants before the winter sets in, rather than large, overgrown specimens, and this is only possible if the plants are put out at the right time in good, firm ground. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## HOME CORRESPONDENCE.

**Aphis on Viburnum Carlesii.**—Referring to Sir Herbert Maxwell's enquiry regarding aphis on *Viburnum Carlesii*, I had some young bushes badly attacked two or three years ago, and I did not discover the trouble until the bushes were smothered with aphis. I sprayed them, but as the foliage was curled up, it was difficult to get at the pest effectively. Growth was much crippled, but the plants grew away later in the summer and appeared to be free. However, the following spring the attack was just as bad, and after two or three sprayings I cleaned the plants and no more aphides were seen that summer. I had several dozen bushes growing elsewhere in thin woodland, and these had no sign of aphis on any of them. The plants that were attacked were growing in full sun. Believing that these *Viburnums* in most cases are woodland plants, I gave them slight overhead shade with excellent results; whether this has had anything to do with the plants not being attacked by aphis or not, I cannot state, but since I moved the plants from full sun to slight shade I have not been troubled with aphis. As aphides cause the leaves to curl up a good deal, ordinary spraying will hardly reach the pests, and if the bushes are not too big, sponging would be more effective, although a much larger job. Every year I confirm my opinion that *Viburnum Carlesii* is one of the very best of shrubs and had I to grow only one shrub, I feel sure my choice would fall on this. It is now at its best here, and the whole air is full of its delicious scent. *G. H. Dalrymple, Bartley.*

**Branching Broccoli.**—The variety Nine Star referred to in your report of the Fruit and Vegetable Committee, on page 310, is stated by Mr. Beckett, in *Vegetables for Home and Exhibition*, to have been raised by a nurseryman at Halstead, Essex, and Beckett states there are good grounds for assuming it to be the result of a cross between a "sprouting" and a "heading" variety; also that it appears to be as perennial as the Perennial Kale. *G. F.*

## SOCIETIES.

### MIDLAND DAFFODIL.

APRIL 21 AND 22.—This Society's two-day exhibition, held at the Botanical Gardens, Edgbaston, in beautiful weather, was a pronounced success, and attracted a bigger attendance of visitors than usual. The most successful competitor was Mr. GUY L. WILSON, of Broughshane, and this year may be called "Wilson's Year," as he was awarded one First Class Certificate and four Awards of Merit for new seedlings, as well as seven first prizes, three Challenge Cups, one Trophy, and three Medals, which must surely be a record for any Daffodil exhibitor at one show. This enthusiastic raiser of seedlings

It is largely due to his untiring efforts, persevering industry and genuine old English courtesy that much of the success attained by the Society is due. His genial presence will be greatly missed, but it is up to those left behind to see that the Society is kept in the forefront of the Daffodil world. Year after year, the late Dr. Lower, also a Past President, brought his choicest seedlings to Birmingham, and by so doing helped to build up and maintain the Society he had so much at heart.

#### FIRST CLASS CERTIFICATE.

*Narcissus Mitylene* (see *Gard. Chron.*, April 10, 1926. Fig. 129).—A charming Leedsii variety with a broad, substantial perianth and a large, cream-coloured crown. Shown by Mr. GUY L. WILSON, Broughshane.

[FIG. 157.—NARCISSUS HOPEFUL.

First-Class Certificate, Midland Daffodil Society, April 21.

Shown by Mr. Guy L. Wilson (see Awards).

has introduced several very good varieties into commerce, and judging from what one saw on his stand at Birmingham, the number of choice varieties is likely soon to be increased. Another Irish firm which met with much success on this occasion was THE DONARD NURSERY Co.; Mr. F. H. CHAPMAN, of Rye, who is always to the fore at big Daffodil gatherings, was another conspicuous exhibitor.

At the Annual General Meeting, held on the first day of the show, the gratifying announcement was made that the Society's finances are in a very satisfactory and progressive condition. All the officers were re-elected and additions made to the Floral Committee. Mr. Henry Backhouse (Past President) who presided, referred in feeling terms to the very great loss the Society had sustained by the deaths of the Rev. Joseph Jacob, M.A., and Dr. N. Y. Lower. For many years, Mr. Jacob filled the office of Co-Hon. Secretary, and later was Chairman, and finally President of the Society.

#### AWARDS OF MERIT.

*Narcissus Hopeful* (Fig. 157).—A handsome, deep yellow, giant Incomparabilis variety. Shown by Mr. GUY L. WILSON.

*Narcissus Flava*.—Another deep yellow Incomparabilis flower of good form and substance. Shown by Mr. GUY L. WILSON.

*Narcissus His Excellency*.—A large, rich, self-yellow Trumpet variety. Shown by Mr. GUY L. WILSON.

*Narcissus Queen of Ulster*.—A beautiful variety with a broad, white perianth and a pale sulphur-yellow trumpet. Shown by Mr. GUY L. WILSON.

*Narcissus Peggy Briscoe*.—This is an Incomparabilis variety with a soft, canary-yellow perianth and orange-coloured cup. Shown by Mr. W. A. WATTS, St. Asaph.

*Narcissus Simple*.—A shapely Leedsii flower with a broad, white perianth and small, pale yellow crown. Shown by Mr. W. A. WATTS.

*Narcissus Snowsprite*.—A handsome, double, white flower of medium size, stained with yellow in the centre. Shown by Messrs. BARR AND SONS, Covent Garden.

*Narcissus Dactyl*.—A pleasing Poeticus variety with a pure white perianth and a large, flat, greenish centre, frilled with orange-red. Shown by Mr. J. LIONEL RICHARDSON, Waterford.

*Narcissus Ditty*.—Another Poeticus variety, with a broad, pure white perianth and a rich orange eye. Shown by Mr. F. H. CHAPMAN, Rye.

*Narcissus Silver Rose*.—Flowers double, very delicate cream-white, with a cream-yellow centre. Shown by Mr. W. F. M. COPELAND, Southampton.

#### OPEN CLASSES.

In the class for a collection of thirty-six varieties representing the different types of Daffodils there were three exhibits against five on the last occasion, which was in 1925, there being no show last year on account of the long spell of hot weather in early April. The schedule required three flowers of each variety. The first prize was awarded to THE DONARD NURSERY Co., Newcastle, Co. Down, whose flowers were remarkable for good form, freshness and purity of colour; among the most noteworthy varieties were Water Lily, White Knight, Rosary, White Wax, Herod, Blizzard, Ace of Diamonds, Festive, Sonata, Hot Spot, Mystic, Sunstar, Mitylene, Firetail, Nannie Nunn, Buttercup, Warsprite, Puck, and Taranto; second, Mr. J. S. ARKWRIGHT, Presteign; with a handsome set of flowers which included excellent specimens of Robur, A.42, Silver Salver, Iliad, Kiaora, Ringdove, Pedestal, Ivorine, Croesus, Crucible, Robin Redbreast, Donax and Kestral; third, Mr. F. H. CHAPMAN, Rye, who showed attractive blooms of White Knight, Ring o' Roses, Harpagon, Helles, Rosary and a number of very promising unnamed seedlings.

In the class for twelve varieties of three stems each of yellow, white and bicolor Trumpets, Mr. GUY L. WILSON, Broughshane, Co. Antrim, won first prize with large, shapely, well-coloured flowers of Honey Boy, Carmel, His Excellency, White Emperor, King of the North, Beersheba, 15/28, Queen of Ulster, Sorley Boy, B.192, White Grenadier and Countess of Antrim. second, DONARD NURSERY Co., with splendid blooms of Carmel, Gorgeous, White Knight, Lady Primrose and Cleopatra; third, Mr. J. E. EXLEY, Leeds.

The winning exhibit of six varieties of yellow Trumpets also came from Mr. GUY L. WILSON, who staged delightfully fresh specimens of Honey Boy, 10/51, Sorley Boy, His Excellency, 12/8, and 5/19; second, Mr. F. H. CHAPMAN, with Golden Flag, Bravo, Rheingold and three unnamed seedlings; third, Mr. J. E. EXLEY.

The best of four exhibits of six varieties of white Trumpets was sent by Mr. GUY L. WILSON, who had uncommonly good blooms of White Conqueror, Eskimo, Kenbane, Beersheba, 12/29, and B.1923; second, DONARD NURSERY Co., with first-rate blooms of White Knight, Sybil Foster, Seedling b.b., White Wax, Mrs. Krelage, and seedling 136; third, Mr. F. H. CHAPMAN.

Mr. GUY L. WILSON was again successful in the class for six bicolor Trumpets with large blooms of Queen of Ulster, Carmel, Jack Spratt, Honour, 13/30 and 136/a/14; second, DONARD NURSERY Co.; third, Rev. T. BUNCOMBE, Black Torrington, Devon.

Included in the Incomparabilis classes were some extraordinarily beautiful flowers. The best six yellow-perianth varieties from Mr. GUY L. WILSON were greatly admired. He showed Pilgrimage, Flava, Hopeful, Copper Bowl, Osiris and 14/29; the second prize was won by DONARD NURSERY Co., who had Tace, Leontes, Donax, Noble, Epaulier and Pilgrim Father; third, Rev. T. BUNCOMBE.

The winner of the first prize for the best half-dozen white Incomparabilis varieties was Mr. F. H. CHAPMAN, who had superb flowers of Taranto and five unnamed seedlings; second, Rev. T. BUNCOMBE, with very good Chryseis and Princess Badura; third, DONARD NURSERY Co., whose set included a beautiful vase of Warsprite. Mr. CHAPMAN again excelled in a class for white-perianth Barrii varieties, with choice

examples of Trenarth, Firetail, Morocco and three seedlings. Mr. J. LIONEL RICHARDSON, Waterford, was second with exquisite flowers of Firetail and Dive-in-the-Dark; third, Rev. T. BUNCOMBE.

The best of five exhibits in a class for six large-crowned Leedsii varieties came from Mr. GUY L. WILSON, who showed handsome blooms of Hymettus, Suda, Ettrick, Snowdrift, Riva and Tenedos. The DONARD NURSERY Co. was second, and Mr. F. H. CHAPMAN, third.

Mr. GUY L. WILSON also led in the next class for small-crowned Leedsii varieties with exquisite specimens of Fairy Circle, Distingue, Alburnia, Hypatia, Silver Plane and Hera; second, Mr. F. H. CHAPMAN; third, DONARD NURSERY Co.

The best set of six Triandrus hybrids was contributed by Mr. W. F. M. COPELAND, Southampton, with unnamed seedlings; second, Mr. W. B. CRANFIELD, Enfield.

The class reserved for six Poeticus varieties was a splendid one. First, DONARD NURSERY Co., with fine flowers of Sonata, Thetis, Ace of Diamonds, Snow King, Ring Dove and 1/24; second, Mr. F. H. CHAPMAN, who had Raeburn, Ditty, Minuet and three seedlings; third, Mr. J. LIONEL RICHARDSON.

#### SINGLE BLOOM CLASSES.

For a yellow Trumpet variety, Mr. J. S. ARKWRIGHT was first with a big, refined, canary-yellow, unnamed seedling, A.437; second, Mr. W. B. CRANFIELD, with a beautiful specimen of Brimstone. In a class for a white Trumpet flower, Rev. R. STRAWBRIDGE, Broughshane, excelled with a magnificent bloom of Beersheba; second, Mr. H. SMITH, Birmingham, with White Empress.

The DONARD NURSERY Co. won first prize in the class for a yellow-perianth Incomparabilis with R. I. Mr. E. H. G. THURSTON, Chandlersford, with 112, XXIII, 18 was second. The winning flower in the class for a white-perianth Incomparabilis was Olwen, exhibited by Mr. W. A. WATTS, St. Asaph. Mr. E. H. G. THURSTON was second, with 98XXII.18. Flowers of Seraglio, in the yellow-perianth Barrii class, secured first and second prizes for Mr. J. LIONEL RICHARDSON and Mr. H. J. MORRIS, Penryn, in the order named. The last-named exhibitor excelled in the white-perianth Barrii class with a perfect bloom of Sacrifice, The DONARD NURSERY Co. being second with Sunstar. The last-named exhibitors were first in the large-crowned Leedsii class with a very choice bloom of Mitylene, and Mr. JOHN PRIEST, Old Hill, Staffs., was second with the same variety. The DONARD NURSERY Co. also led in the class for a small-crowned Leedsii with Sumaria. Mrs. H. L. M. MORRIS, Penryn, was second with St. Ilario. The DONARD NURSERY Co. had the best triandrus hybrid in a beautiful flower of Venetia; second, Mr. W. F. M. COPELAND, with 1058.

The winning exhibit in the class for a Cyclamineus hybrid was a dainty flower, No. 7. vi. 23, exhibited by Mr. E. H. G. THURSTON; second, Mr. W. F. M. COPELAND, with Flycap. For a Jonquilla hybrid, the Rev. T. BUNCOMBE was placed first, with a pleasing specimen of Buttercup, and Mr. A. H. BASSANO, Old Hill, Staffs., was second, with the same variety. Peerless was the best flower in the Tazetta or Tazetta hybrid class, shown by Mr. W. A. WATTS.

For a true Poeticus variety, Mrs. H. L. MORRIS was to the fore with an exquisite flower of Snow King. Mr. H. J. MORRIS was second with Dulcimer. The DONARD NURSERY Co. had the best double-flowered variety with No. 60, Mr. W. A. WATTS being second with B. 78.

#### SEEDLINGS AND NEW VARIETIES.

The much coveted Bourne Challenge Cup offered for twelve varieties, one stem of each, raised by the exhibitor, was won by Mr. GUY L. WILSON, with high quality blooms of Flava, Mary Malony, Hopeful, Buff Barrii, Queen of Ulster and seven unnamed seedlings. In Mr. CHAPMAN's second prize collection were charming examples of Mizapore, Ditty, Confetti and unnamed seedlings of great promise. The winning set of six varieties, raised by the exhibitor, came from Mr. J. S. ARKWRIGHT,

who showed choice, unnamed varieties. Sir CHARLES H. CAVE, Bart., Sidmouth, who secured second prize, had a charming flower of Beethoven; third, Rev. T. BUNCOMBE.

For three varieties, same conditions as in the last class, Mr. W. F. M. COPELAND excelled with exquisite specimens of Silver Rose, Marcella and 1383; the second prize went to Miss POPE, Kings Norton, and the third to Mr. E. H. G. THURSTON. In a companion class to the last one, but open only to those who have never won a prize for seedlings (single bloom classes excepted), Mr. J. S. ARKWRIGHT beat Mrs. E. V. BUTLER, of Tewkesbury, and Mr. B. ROBINSON, respectively. The Cartwright Challenge Cup, offered for twelve varieties of Daffodils, was awarded to The DONARD NURSERY Co., whose collection included grand, well-set-up flowers of Brimstone, Hexagon, Eucharis, Samaria, Ace of Diamonds, Mitylene, Sunstar and Ringdove. Mr. GUY L. WILSON was a good second with Nissa, Osiris, Mitylene, Carmel, Gaza and Rosary, in splendid condition; third, Mr. W. A. WATTS. For six varieties, Mr. H. J. MORRIS beat the Rev. T. BUNCOMBE with excellent blooms of Samaria, Sacrifice, Caedmon, Silver Chimes and Mowgh. The Rev. T. BUNCOMBE's best flower was Wheel of Fortune.

The Walter Ware Challenge Cup for six obvious Triandrus seedlings, one stem of each, was won by Mr. W. B. CRANFIELD, who had handsome flowers of Maid Monica, Wavelet, Venetia, Harvest Moon, White Coral and an unnamed seedling; second, Mr. W. F. M. COPELAND, third, Mr. W. A. WATTS.

The White Daffodil Trophy was offered for six varieties of white Trumpet Daffodils, and of the nine contestants, Mr. GUY L. WILSON was again the successful exhibitor with large flowers of superior merit; second, DONARD NURSERY Co.; third, Mr. J. E. EXLEY.

The Leamington Challenge Cup, offered for six varieties of Daffodils with red coronas, attracted five contestants. Mr. W. A. WATTS was the winner, with Peggy Briscoe, Curtain, Domino, B. 126, B. 129 and B. 67; second, Mr. M. J. LIONEL RICHARDSON, whose best flowers were Kileroney, King of Clubs and Coronach; third, DONARD NURSERY Co.

The Arkwright Challenge Cup, offered for six bicolor Trumpet Daffodils, was awarded to Mr. GUY L. WILSON, whose flowers of Jack Spratt, Honour, Tapin and three unnamed seedlings, were particularly good. The best specimens in THE DONARD NURSERY Co.'s second prize set were Carmel and Lady Primrose; third, Mr. F. H. CHAPMAN.

The Williams Challenge Cup, offered for six varieties of yellow shades, but without red colouring in the cup, was won by the redoubtable Mr. GUY L. WILSON with Hopeful, Flava and four unnamed varieties; second, DONARD NURSERY Co., whose best examples were Roundel, Gorgeous and Cleopatra; third, Mr. J. S. ARKWRIGHT.

#### AMATEUR CLASSES.

In the class for a representative collection of twenty-four varieties of Daffodils, three stems of each, Mrs. E. V. BUTLER had a "walk-over," with a nice, clean set of flowers in which the following varieties were meritorious, viz., Virgilia, Snow King, Firetail, Nannie Nunn, Lord Kitchener, Cassandra and Cornelia.

For six varieties of yellow, white and bicolor Trumpet Daffodils, three stems of each, Mr. A. H. BASSANO, Old Hill, just managed to beat Mr. R. ROBINSON, Spilsby; third, Mrs. E. V. BUTLER.

Mr. B. ROBINSON won first prizes for (1) six Incomparabilis varieties, and (2) six Leedsii varieties; and Mrs. BUTLER excelled in classes for (1) six Barrii varieties, (2) three Tazetta varieties; and (3) three Poeticus varieties. Mr. H. A. MARRIMER, Billingshurst, won the Silver Vase offered by Messrs. Cartwright and Goodwin for six varieties of Daffodils.

In a class for a bowl of Daffodils, Mr. J. S. ARKWRIGHT was awarded first prize, Miss POPE, the second, and Mr. W. A. WATTS, the third prize.

#### MEDAL AWARDS.

The Birmingham Botanical and Horticultural Society's Medals were awarded as follow:—Classes 1 to 29: Silver Medal to The DONARD NURSERY Co., with 112 points; Bronze Medal

to Mr. F. H. CHAPMAN with seventy-five points; Classes 15 to 29 and 30 to 41: Silver Medal to The DONARD NURSERY Co. with sixty-eight points. Bronze Medal to Mr. GUY L. WILSON, with fifty-four points. Classes 15 to 29 and 43 to 56: Silver Medal to Mr. H. A. MARRIMER, with forty-five points; Bronze Medal to Mr. B. ROBINSON, with forty-four points.

#### HONORARY EXHIBITS.

Gold Medals were awarded to Messrs. BARR AND SONS, for a comprehensive collection of beautifully fresh, well-set-up Daffodils, of which Snowsprite, White Sentinel, Red Gauntlet, Royal Lady, Mitylene, Ringdove, Beersheba, Peter Barr and Brunhilde were of outstanding merit and to The DONARD NURSERY Co., for a large group containing many of the best varieties of the present-day Daffodils.

Silver-Gilt Medals were awarded to Mr. GUY L. WILSON for a choice collection of Daffodils, in which were many popular varieties of the exhibitor's own raising, together with a number of seedlings not yet in commerce; to Mr. W. F. M. COPELAND, Southampton, for a collection of Daffodils, in which double-flowered varieties predominated; to Mr. W. A. WATTS, St. Asaph, for a decorative arrangement of Daffodils; the varieties Peggy Briscoe, Simple, Twinkle, Domino, Curlew, Charter and many others were very attractive; to Messrs. HEWITT, Solihull, for a group of Daffodils arranged in bold masses; to Messrs. CARTWRIGHT and GOODWIN, Kidderminster, for a group of Daffodils in which many of the best varieties were represented; to Mr. HERBERT J. LONGFORD, Abingdon, for Daffodils and Tulips; and to Mr. N. ZANDBERGER, Rijnsburg, for a large and beautiful collection of big, strong-stemmed Tulips.

A Silver Medal was awarded to Messrs. BAKERS, Wolverhampton, for hardy flowering shrubs and herbaceous flowers.

A Bronze Medal was awarded to Messrs. SHEPPARDS, Hollywood, for a small collection of daintily arranged rock garden plants.

#### RHODODENDRON.

MAY 3 AND 4.—The second show of the Rhododendron Society exceeded anticipations in every respect. During the previous fortnight frosts had been fairly general, with serious effects on many plants throughout the country, but, fortunately, sufficient trusses escaped to make an exceedingly interesting display. Most of the sixty-two classes were well-filled, and it was interesting to note that, while most of the species and varieties were of what are generally considered to be somewhat tender Rhododendrons, the greatest successes were obtained from Bodnant, the most northern garden that was represented at the show. LADY ABERCONWAY won a handsome Silver Challenge Cup, twelve first and several second prizes, and also the special prize offered for the best hybrid Rhododendron in the show, with Betty, the lovely hybrid between R. Fortunei and R. Thomsonii. The best species in the show was a good truss of R. Nuttallii, shown by Mr. G. W. E. LODER.

We were pleased to note a marked improvement in the arrangement of most of the collections, though a few lacked finish. The group of species of the Lapponicum series, from the Chinese Alps, which was shown by the Society in a sandstone rock garden to illustrate the value of these species for the rock garden and general garden purposes was admirable in its inception, and Mr. J. B. STEVENSON who, we believe, was responsible, is to be congratulated on its great success.

Section B of the Floral Committee of the Royal Horticultural Society met during the morning of the first day and made awards to novelties.

#### Floral Committee.

Present: Section B.—Mr. Gerald Loder (in the chair) Mr. R. W. Wallace, Mr. T. Hay, the Hon. Henry MacLaren, Mr. J. C. Lucas, Mr. A. Bedford, Mr. F. G. Preston, Mr. George Harrow, Mr. G. Reuthe, Mr. E. H. Wilding, Mr. R. C. Notcutt, Mr. W. J. Bean, Mr. W. G. Baker, Mr. C. Williams, Mr. E. A. Bowles,

Mr. Hiatt C. Baker, Mr. Reginald Cory, Mr. L. R. Russell, Sir William Lawrence, Bt., and Mr. N. K. Gould, Secretary.

#### AWARDS OF MERIT.

*Rhododendron russatum*.—A twiggy, low-growing shrub, discovered by Forest in North-west Yunnan, in 1917, at an altitude of 12,000 feet. The leaves are scarcely two inches long and half-an-inch wide, pitted on both surfaces with little dots. The small flowers are borne, four or five together, in little trusses, at the ends of the growths, and are of a deep, rich, purplish blue. Shown by A. N. WILLIAMS, Esq. (gr. Mr. R. M. Gregory), Werrington Park, Launceston.

*Rhododendron Betty*.—This handsome, large-flowered hybrid is the result of crossing R. Fortunei with R. Thomsonii, and was raised by Sir Edmund Loder. The widely-expanded flowers are of a lovely deep pink shade, somewhat paler in the centre, and the truss shown carried eleven splendid blooms. Shown by LADY ABERCONWAY and the Hon. H. D. McLAREN (gr. Mr. F. C. Puddle), Bodnant, Tal-y-Cafn, North Wales.

*Arbutus furiens*.—A Chilean plant that appears to be hardy only in the warmer parts of southern England and the south of Ireland. It is an erect-growing shrub with rough, stiff, tough and bristly ovate leaves from the axils of which the little hirsute racemes extend, from one to two inches in length. The small, pendent, pitcher-shaped flowers are porcelain white and set very closely on the stem, so many as a dozen or sixteen being crowded in one raceme. *Gaultheria furiens* is a synonym of *Arbutus furiens*. Shown by Mr. G. REUTHE.

*Cassiope Mertensiana*.—This delightful little plant is a native of California, and the American Pacific coast. It grows about six inches high and its synonym of *Andromeda cupressina* suggests, by its specific title, the manner in which the small leaves clothe the erect stems. The pure white, pendant flowers, like little fairy bells, are reminiscent of those of Lily-of-the-Valley, but each flower has a tiny green calyx. This species is a somewhat rare plant, and is sufficiently hardy, merits wider cultivation by those who can successfully manage Ericaceous subjects. Shown by Mr. G. REUTHE.

#### GROUPS OF RHODODENDRONS.

There were six classes for groups of Rhododendrons, and these were equally divided between traders and amateurs. As was to be expected, the trade groups were the larger, but the principal amateur collections were arranged with more taste and skill and were exceedingly effective.

The best trade group of Rhododendron plants was set up by Messrs. R. GILL AND SON, and this imposing display contained a great variety of interesting species and hybrids. The chief sorts in flower were Rhododendrons Lindleyi, caloxanthum, Edgworthii, burmanicum, Dalhousiae, album, Nuttallii, orbiculare, glaucum and Pink Pearl. A selection of plants not in flower well illustrated the foliar beauty of many species. There were the exceedingly handsome leaves of R. giganteum, R. sino-grande and R. auriculatum, and the smaller, woolly foliage of R. spectabile and R. lanatum.

The second prize group of Messrs. WALLACE AND CO., LTD., was composed chiefly of the hardier hybrids, and its colour value was great. They had well-flowered standards of Britannia, King George, W. F. Wery, Noreen Beamish and other sorts, bearing large trusses of brilliantly coloured flowers, rising above the bright pink blooms of Hugo de Vries and Alice, the softer shades of Corry Koster, Mauve Queen and Smithii aureum. In their good third prize collection, Messrs. WATERER, SONS AND CRISP had vivid trusses of Doncaster, Earl of Athlone, Bagshot Ruby and Michael Waterer in harmony with Prince of Wales, Pink Pearl, White Pearl, the beautiful blush pink Mrs. C. E. Stirling, Sweet Simplicity, with blush-pink margins to the petals, and the smaller, blue-coloured species R. Augustinii. Messrs. J. CHEAL AND SONS were fourth in this important class, and they included good plants of Gomer Waterer, Fred Waterer and Alice.

The groups of Azalea plants, by trade exhibitors, made pretty displays. Messrs. R. G. CUTHBERT were first, and they had glowing masses of Elizabeth and Brilliant, two very fine mollis varieties, Dazzle, Apple Blossom, Minoru and Peggy O'Neil, hybrids of mollis and sinensis, and several of the useful Azalea rustica varieties. Messrs. STEWART AND SON were second, and they included floriferous plants of Feodora and Betty, hybrids between A. malvatica and A. Kaempferi, and Brilliant.

The class for a trade group of cut Rhododendrons was not so satisfactory as the others. Messrs. M. KOSTER AND SONS were awarded the first prize for a small collection of hybrids, and Messrs. R. GILL AND SON were placed second with a larger collection of good blooms which would have been interesting had the sorts been named.

Several trade collections, not for competition, were of considerable merit. In a corner space by the Tea Annexe, Messrs. R. VEITCH AND SON had a very pretty group of Loder's White, Standishii, large white flowers with carmine-spots, Mrs. Thiselton Dyer, of beautiful deep rose-pink colour, Sesterianum, a large white variety, the beautiful white Veitchianum, and the following Kurume Azaleas—Moniji, salmon, Korang-yuki, orange-red, Shin Teikai, white, and Blood Red. An attractive group of Kurume Azaleas, arranged on a floor space by Messrs. WALLACE AND CO., included the well-known Hinodegiri, Amoi No Sara, lilac shades, Takasago, blush, and Sakata, pink.

Messrs. HILLIER AND SONS had a large group of general Rhododendrons and Azaleas. Along the centre they placed well-flowered bushes of George Hardy, R. Broughtonii and others, rising above bushes of Sir Richard Garton, Corry Koster, Countess of Athlone, Langley Park and similar large-flowered hybrids, with the white R. hortulanus, R. malvatica and mollis hybrids. Mr. G. REUTHE included Rhododendrons Alice Fitzwilliam, exoniense, fragrantissimum, Kurume and mollis Azaleas, with various general flowering shrubs.

#### AMATEURS' EXHIBITS.

The Challenge Cup offered for the best exhibit in the three classes for groups of Rhododendrons was won by LADY ABERCONWAY and the Hon. Henry D. McLAREN (gr. Mr. F. C. Puddle), Bodnant, North Wales, for their splendid first prize collection arranged on a space not exceeding 150 feet super. This exhibit, which must have filled the maximum space allowed, was composed of beautiful and interesting plants, arranged with great skill and taste. The most prominent Rhododendrons were the beautiful blue R. Augustinii, plentiful sprays of R. yedoense, with graceful, double, pink flowers; R. callimorphum, the lovely-shaped bells of Apple-blossom pink colouring; a beautiful pink hybrid between orbiculare and Williamsianum; an unusually deep-coloured form of R. calostrotum; a cross between R. oreotrephes and R. cinnabarinum; Luscombe's Scarlet, Loder's White, R. Thomsonii, and a large, pink Fortunei x Thomsonii hybrid.

The second prize was won by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Hampshire. This handsome exhibit contained large vases of Loderi, Geoffrey Millais, Slocock's No. 19, a lovely blush-pink truss, and Aucklandii x orbiculare. There were also very good vases of R. Thomsonii grandiflora x R. campylocarpum, Ernest Gill, a pink Aurora hybrid, Penjerick, R. neriiflorum and R. zeylanicum. Admiral A. WALKER-HENEGE-VIVIAN, Clyne Castle, Swansea, was third in this admirable class, and he showed beautiful trusses of Ascot Brilliant, Countess of Haddington, arboreum hybrids of many good shades of pink colour, a good hybrid between R. Falconeri and R. Hodgsonii, and Singleton Blue, a good truss of R. niveum type and colouring.

In the class for a medium-sized group, Lt.-Col. STEPHENSON-CLARKE, C.B., Borde Hill, Cuckfield, and J. C. WILLIAMS, Esq., Caerhays, Cornwall, were placed equal firsts. The latter had good examples of R. cinnabarinum, R. Augustinii, Lady Alice Fitzwilliam, R. saluenense, with small violet flowers, R. Iverianum, and several of the small-flowered species of value for the rock garden. The chief sorts shown by Mr. J. C. WILLIAMS were R. leptothrium, the rose-coloured

R. zephroepodium, R. hippophaeoides, forms of R. sphaeranthum, R. orbiculare and R. haematodes. Sir JOHN RAMSDEN, Bt., Bulstrode, Bucks, was awarded the third prize for an exhibit of unnamed Rhododendrons.

A. M. WILLIAMS, Esq., Werrington Park, Launceston, was awarded the first prize in the class for a group of Rhododendron species, and he showed good sprays and trusses of R. Augustinii, R. decorum, R. hormophorum, R. chasmanthoides, R. impeditum and R. chameunum. The best collection of single trusses of twelve hybrids was shown by LADY ABERCONWAY and the Hon. HENRY D. McLAREN, who had admirable examples of Coalition, a rich, ruby-red which produces a pistil but no stamens; Loderi var. Patience, of beautiful pale flesh-pink colour, a rich red R. arboreum x Fortunei, and a pink R. Fortunei x Thomsonii. Lt.-Col. STEPHENSON-CLARKE, C.B., who was a good second, had Penjerick, Loderi, a highly-coloured Gauntlettii x and a salmon-pink tinted form of R. campylocarpum. Sir JOHN RAMSDEN, Bt., was third. The best six species was shown by G. W. E. LODER, Esq., who included moderate trusses of R. niveum, R. adenopodum and R. campylocarpum. LIONEL DE ROTHSCHILD, Esq., was second.

The exhibits of six hybrids were of great beauty. P. D. WILLIAMS, Esq., Lanarth, Cornwall, was first, and he had three distinct hybrids between Smith's Scarlet and Aucklandii, and a fine truss of G. Millais. Sir JOHN RAMSDEN, Bt., was second, and he included good trusses of Unknown Warrior and C. B. van Ness. G. W. E. LODER, Esq., Wakehurst Place, Ardingley, was first with well-flowered alpine Rhododendrons, and he showed good plants of R. impeditum, R. calostrotum, R. saluenense and a dwarf form of R. racemosum. Sir JOHN RAMSDEN, Bt., was awarded a second prize for a group of alpine which included R. racemosum, R. virgatum, R. radicans, R. impeditum and R. saluenense.

#### SINGLE TRUSS CLASSES.

The best truss of a species for which a special prize was given by the Hon. H. D. McLAREN, was adjudged to be R. decorum, shown by G. W. E. LODER, Esq.; second, R. xenosporum, shown by E. J. P. MAGOR, Esq.

The best truss of a hybrid for which a special prize was presented by G. W. E. LODER, Esq., was R. Loderi var. Patience, shown by LADY ABERCONWAY and Hon. H. McLAREN. The broadly campanulate drooping flowers are nearly six inches across the mouth, and a delicate blush colour; second R. Geoffrey Millais, a large truss of big, white flowers, with brownish spots in the lower petals; shown by LIONEL DE ROTHSCHILD, Esq.

The best truss of a blood-red arboreum was shown by Admiral A. WALKER-HENEGE-VIVIAN, Clyne Castle, Swansea, in Sun of Austerlitz; second, LADY ABERCONWAY and Hon. H. D. McLAREN.

Only two competed in the class for a truss of the Campanulate series, and the first and second prizes were awarded to LADY ABERCONWAY and the Hon. H. D. McLAREN and LIONEL DE ROTHSCHILD, Esq., in this order, for R. Wightii and R. campanulatum respectively. They were quite distinct in colour, the former being cream and the latter violet.

Mrs. TREMAYNE, Carlew, Perranwell, Cornwall, was alone in the class for a truss of R. Falconeri, and was awarded the second prize.

Seven competed in the class for Aucklandii or Griffithianum, and the premier award was made to R. Aucklandii, shown by G. W. E. LODER, Esq.; G. H. JOHNSTONE, Esq., and Admiral A. WALKER-HENEGE-VIVIAN were placed equal second.

Of the Fortunei series, the best was adjudged to be R. Fortunei Forrest, shown by P. D. WILLIAMS, Esq., Lanarth, St. Keverne, a very richly coloured form, and the second prize exhibit, shown by Mrs. TREMAYNE, was also R. Fortunei, a beautiful truss of imposing flowers of a faint blush tint. The rich, cerise-pink R. orbiculare gained a prize in this section.

Three competed in the class for one truss of the Irroratum series, and the largest flowers, of R. Mori, shown by Mr. MAGOR, were placed first.

There were also three exhibits in each of the

classes for *Megacalyx* sub-series, and *Maddenii* series respectively. The first prize in the former class was awarded to J. J. CROSSFIELD, Esq., Embley Park, Romsey, for much the largest flowers and truss, and second prize to Mr. MAGOR for R. Lindleyi.

The best of three trusses of *Maddenii* series was shown by J. B. STEVENSON, Esq., Tower Court, Ascot, who had a superb truss of R. Nuttallii; second, the beautiful, white R. Veitchianum, shown by LADY ABERCONWAY and the Hon. H. D. McLAREN.

Two showed in the class for the *Haematodes* sub-series, and the second prize only was awarded to A. M. WILLIAMS, Esq., Herrington Park, Launceston, for R. haematodes.

LADY ABERCONWAY and the Hon. H. D. McLAREN excelled in the *Neriiflorum* series with a splendid truss of R. neriiflorum; second, G. W. E. LODER, Esq.,

Mr. A. M. WILLIAMS showed the best truss of the *Sanguineum* series in R. dichroanthum, and he was second with the same species.

The better of two exhibits of the *Taliense* series was R. Faberi, shown by G. W. LODER, Esq.; the black anthers are very conspicuous in the open, white flowers; second, R. Wasonii Yellow Gown, shown by LADY ABERCONWAY and Hon. H. D. McLAREN.

Mr. LODER also excelled in the class for the *Campylocarpum* sub-series with a fine truss of the clear yellow R. campylocarpum; second, Mr. A. M. WILLIAMS, with R. cyclium, Forrest 15,808.

A grand truss of R. Thomsonii, shown by LIONEL DE ROTHSCHILD, Esq., in the class for the *Thomsonii* sub-series, was placed first, and the Rt. Hon. the EARL OF STAIR was second.

For a spray of any deciduous species of the *Azalea* series there were five competitors, and LADY ABERCONWAY and the Hon. H. D. McLAREN excelled with the big-flowered R. Schlippenbachii, a beautiful, pale pink species with light green foliage, forming a rosette at the ends of the shoots; second, R. Vaseyi, shown by the same exhibitors.

The best spray of an evergreen species of *Azalea* was shown by Admiral A. WALKER-HENEAGE-VIVIAN.

Mr. ROTHSCHILD was awarded the first prize in the class for the *Campylocarpum* series for R. aureum; Mr. G. W. LODER was second with R. glaucum.

In the *Cephalanthum* series, Mr. A. M. WILLIAMS was first with R. sphaeranthum, and Mr. ROTHSCHILD second, with K.W. 3,988, a little gem, with pink flowers and deep pink tubes.

The *Cinnabarinum* class was poor, and here the first prize was won by Sir JOHN RAMSDEN, Bart., who also excelled in the *Edgworthii* series with R. Edgworthii.

The EARL OF STAIR showed the best of the *Heliopsis* series in R. rubiginosum, and Mr. ROTHSCHILD was second with R. polylepis.

One of the best classes, in which thirteen competed, was for the *Lapponicum* series, and the beautiful violet-blue R. russatum, shown by Mr. A. M. WILLIAMS, won easily, and he also secured the second prize with Forrest No. 16,282, a species like R. impeditum.

Mr. WILLIAMS again met with success in the class for the *Lepidotum* series with R. Baileyi, a very distinct and attractive species with flat, Plum-purple flowers; and he had the best R. Augustinii, one of the showiest *Rhododendrons* for gardens; the best of the *Oreotrephes* series, in R. oreotrephes, and the best in the large class for one spray of any of the *Triflorum* series in the exquisite R. Davidsonianum.

Admiral WALKER-HENEAGE-VIVIAN was alone in the class for a large-leaved hybrid, and was awarded the first prize.

The exhibits in the class for a hybrid between R. Aucklandii and other species were all of great merit, and LADY ABERCONWAY and Hon. H. D. McLAREN had a magnificent truss of R. Loderi var. Patience, which won easily; second, Col. STEPHENSON-CLARKE, with R. Loderi.

LADY ABERCONWAY and Hon. H. D. McLAREN also carried off the first prize in the class for an *Aucklandii* hybrid with a fine truss of R. kewensis  $\times$  R. Griffithianum.

The best truss of any *Azalea-dendron* was Hinodegivi, shown by P. D. WILLIAMS, Esq.

Mr. L. DE ROTHSCHILD excelled in the class for a spray of any deciduous *Rhododendron* hybrid, including *Azalea*. Mr. LODER won in the class for a spray of any *cinnabarinum* hybrid with a fine *cinnabarinum*  $\times$  R. oreotrephes cross having a faint purple suffusion on pink and a deeper pink exterior. In the class for a spray of any hybrid of an alpine species, the first prize was won by Mr. A. M. WILLIAMS, with a hybrid of R. fastigiatum  $\times$  R. Augustinii; the colour is lavender-blue.

### HORTICULTURAL CLUB.

FOLLOWING the dinner of the Horticultural Club on the 5th ult., Mr. W. B. Cranfield delivered a lecture, illustrated by lantern slides, on "British Ferns and Their Varieties." Mr. Cranfield stated that there are between thirty and forty species of Ferns indigenous to the British Isles. Sports presenting infinite variety are found wild and from these wild finds many most beautiful hardy Ferns have been raised, far transcending the parental and normal wild types in interest and beauty. Fifty years ago many of these sports were cultivated which would not obtain recognition to-day, but even by rigorous selection varieties of merit are still very numerous. Lowe's *Hand Book*, published in 1908, describes over 1,700 varieties, of which 1,300 were wild finds. The late C. T. Drury's book, *British Ferns and Their Varieties*, is the most comprehensive work on the subject. The lecturer stated that Fern hunting is full of interest and pleasure, and the most desirable hunting grounds are the more secluded byways and country lanes or hillsides. It must not be thought that the finding of varietal forms was a simple matter—many thousands of Ferns would probably be encountered before a variety worthy of collection would be noticed, and if a week's diligent hunting produced two or three good varieties the collector might be considered fortunate.

The nomenclature of Ferns has given rise to much adverse criticism. He said that botanists are responsible for specific names, Fern-growers for varietal terms. The principle underlying the latter was descriptive, to which, for the purpose of identification, may be added the name of the finder or raiser. Fortunately, all our British Ferns have common names—*Athyrium Filix-foemina* being known as the Lady Fern, *Lastrea Filix-mas* and *L. Pseudo-mas*, as Male Ferns; *Scolopendrium* as the Hartstongues, *Polystichum angulare* and *P. aculeatum* as the Soft and Hard or Bristly Shield Ferns, respectively, etc. The varietal forms are classified into definite groups which lead naturally from one to the other, and once this principle is mastered, nomenclature becomes a comparatively simple matter. A glossary of terms applicable to the various species was to be formed in the *British Pteridological Society's Gazette*.

The most prolific method of reproduction is by spores, as distinguished from seeds in the flowering plant, and other normal means of increase are by growth and division of the crown, by basal buds, bulbils occurring on the fronds, soral and apical apospory.

Mr. Cranfield explained the method of propagating Ferns from basal buds, which may be induced to develop by artificial means, especially in some species. In the case of the *Hartstongue*, bases of the old fronds may be detached from the caudex, cleansed, and the old roots removed—these, if laid on about two inches of moist, sterilised silver sand in a glass bottle, the mouth of which is protected by a glass slip to prevent evaporation, and the bottle placed on a shelf in a shady place, will form buds, which in from three to six months will develop into young Fern plants. These, when sufficiently rooted, may be removed, potted, and gradually hardened off; the young plants will grow rapidly into fine specimens. *Lastrea montana*, *Athyrium Filix-foemina* and *Polystichum angulare* may be raised in the same manner, though not so readily. With *Athyria* it is essential that a portion of the caudex be attached to the base of the frond. Though bud sports are not unknown, the young plants will, with rare exceptions, be true to parental types. This method is chiefly adopted with true

plumose forms which do not produce spores. The lecturer stated that apospory, both soral and apical, was induced by close cultivation, and occurs in the Soft Shield Fern, the Lady Fern, the Male Fern and the Hartstongue. Soral apospory takes the place of the normal sporangia. In apical apospory the pinnulets are prolonged and the ends of the growths dilated. In both, when laid down in contact with soil and covered to prevent evaporation, prothalli will be formed from which young Ferns will eventually spring, but the progeny cannot all be relied upon to come true, many being ragged, most of them weak constitutionally, but occasionally faults inherent to the parent are bred out.

Bulbils occurring on the rachis of the frond will readily grow if the frond, whilst attached to the plant, be pegged down on fine soil and left undisturbed until roots have formed, when the whole can be removed bodily and the young plants potted off. It is important to peg the frond down securely near its junction with the caudex as well as at the end.

Mr. Cranfield stated that the "*pulcherrimum*" types in *Polystichum angulare* are considered the rarest form of variation—only six examples are recorded as having been found wild, and of these only two now survive. Others have, however, been raised in recent years. They require careful cultivation and are not suited to general outdoor conditions.

The choicest varieties for general cultivation are the plumose forms, which are mostly barren, and embrace the "*crispum*" section in the Hartstongue; "*incisum*" in *Asplenium* and *Trichomanes*; "*plumosum*" in *Lastreas* and *Athyria*; "*plumose divisilobes*" in *Polystichum angulare* and the *Cambricum* section of *Polypodium vulgare*.

There were three marked periods in the development of Fern cultivation. The raising of the plumose *divisilobum* section of *Polystichum angulare* by the late Col. Jones and Dr. Fox; the raising of the *superbum* types in *Athyrium Filix-foemina* by the late Mr. C. T. Drury, and the *gracillimum* varieties in *Polystichum aculeatum* by the late C. T. Drury, C. B. Green, Dr. F. W. Stansfield and the lecturer.

A series of about ninety slides were shown on the screen illustrating the choicest varietal forms in *Asplenium Trichomanes*, *Athyrium Filix-foemina*, *Blechnum spicant*, *Lastrea Filix-mas*, *L. Pseudo-mas*, *L. montana*, *Polystichum angulare*, *P. aculeatum*, *Polypodium vulgare* and *Phyllitis Scolopendrium* (*Scolopendrium vulgare*) with sketches showing the life cycle of the Fern; the prothallus and young Ferns in various stages of development; the interior of several indoor ferneries, and Ferns growing in Mr. Cranfield's own garden. The display of the slides was accompanied by running comments on the history or pedigrees of the subjects illustrated.

In conclusion, the lecturer urged his hearers to grow some of the most marked varieties in place of the common or weedy forms usually seen. To enjoy varieties it was not necessary that the plants should be divisions of the original sport but seedlings, if true to type, were, save to the connoisseur, equally attractive. A selection of forty of these beautiful hardy Ferns might embrace the following types, all of which are easily obtainable through trade sources:—*Asplenium Trichomanes incisum*, *Athyrium Filix-foemina cristatum*, A. F. f. *pericristatum*, A. F. f. *plumosum* Warminster, A. F. f. *divaricatum* *superbum*, A. F. f. *pericristatum*, A. F. f. *Frizelliae*, A. F. f. *Victoriae*, *Blechnum spicant cristatum*, B. s. *plumosum*, Airey, No. 2, *Lastrea dilatata grandiceps*, L. *Filix-mas cristata*, L. F. m. *polydactylla*, L. *Pseudo-mas cristata*, L. P. m. *polydactylla*, Wills, L. P. m. *ramosissima*, L. *montana cristata*, *Osmunda regalis cristata*, *Polypodium vulgare cambricum*, P. v. *trichomanoides*, P. v. *grandiceps*, P. v. *pulcherrimum*, *Polystichum aculeatum pulcherrimum*, P. *angulare acutitubum*, P. a. *congestum*, P. a. *cristatum*, P. a. *decompositum*, P. a. *divisilobum*, P. a. d. *stipulatum*, P. *grandiceps*, P. *plumoso-divisilobum*, P. *plumosum*, P. *tripinnatum*, *Phyllitis Scolopendrium crispum* (*Scolopendrium vulgare*), P. S. *cristatum*, P. S. *laceratum*, P. S. *multifidum*, P. S. *projectum*, P. S. *ramo-cristatum*.

## Obituary.

**David Roberts.**—The news has just reached us of the death of Mr. David Roberts, at Brook Lane, Chester, on Good Friday last. Mr. Roberts was an old and valued employee of Messrs. Dicksons, Ltd., where he had been engaged for over forty years, and during a large part of that period had charge of the herbaceous and alpine departments of this firm's nursery. He was a very observant man and one who "did good by stealth," consequently he was greatly beloved by all members of the staff and held in very high respect by all who were associated with him in private life. The funeral, which took place at the Grosvenor Park Baptist Church, was largely attended by those who had been associated with him in business and in church work. He was sixty-five years of age, and leaves a widow and one son.

## ANSWERS TO CORRESPONDENTS.

**BOUNDARIES AND NEIGHBOUR'S RIGHTS.**—*E. G. D.* (1) Your neighbour is entitled to build a fowl pen up to the boundary of his land. He is not entitled to enter on your land or path to tar or for any other purpose without your permission, nor can he tar or leave any tar on land or property belonging to you. (2) You have a right to the enjoyment of your property without nuisance from your neighbour's property. If the condition of the stable amounts to a nuisance you can call upon him to abate the nuisance and bring an action to compel him, but in the circumstances the easiest plan would be to lodge a complaint with the local sanitary authority who will condemn the premises if they contravene the Public Health Acts.

**DISEASED CROWN IMPERIAL BULBS.**—*W. J. W.* No fungus or bacteria likely to cause the death of the plants was found in the diseased bulbs sent us, so possibly the damage is due to some cultural error, such as might be caused by a hoe or a fork.

**FRUIT BUDS DAMAGED.**—*W. R. G.* The Apple buds have been damaged by birds, probably bullfinches, or possibly by grey squirrels. The loss of the Plum buds might also be caused by birds, either bullfinches or sparrows, which are often troublesome in this way. We have also seen all the fruit buds of Plums drop out as a result of spraying too late with a tar-distillate wash. We suspect spray injury in the case of the Pear buds. Possibly you used an unreliable brand of tar-distillate wash or sprayed when the buds were too far advanced.

**GARDENER'S NOTICE.**—*W. C. S.* The matter really turns on the custom in your particular locality. Subject to this, it has been held that a head gardener is entitled to give and receive a month's notice. The length of notice an under-gardener should give or receive has not yet been decided by the High Court, but there have been at least two decisions by County Court Judges that the same length of notice applies to an under-gardener. Such decisions, however, are not binding on other Judges. The same length of notice would, presumably, apply in the case of a gardener in sole charge.

**NECTARINES AND PEACHES FAILING TO SET.**—*V. B.* From your letter, we are inclined to think the trees have made gross growth in the rich border unsuitable for fruiting well. Examine the border next October, partially lift the trees and add more lime-rubble, making the soil very firm afterwards. In a cold house facing west do not syringe the trees until after the fruits have set, and allow the growth to develop in a more natural manner. Pollenate the flowers and admit a little air in the house, both night and day, in blossoming time, to allow excessive moisture to escape.

**Communications Received.**—*L. H.*—*R. R.*—*R. F.*—*E. B.*—*W. A.*—*M. A.*—*A. G.*—*T. P.*—*F. K. W.*—*E. D.*—*C. M.*—*G. W. B.*—*G. A.*—*O. M.*—*H. S.*—*T. V.*—*A. A. L.*—*J. H. B.*—*G. A.*

**REMARKS.**—White flowers are the most valuable in this department, such as double white Stocks and cut Hydrangeas. The first consignment of Double White Narcissus have arrived this week. Narcissus ornatus is now practically finished, but more N. Poeticus were available to-day, and prices will gradually lessen during the next day or so. The newest arrivals are Stephanotis, Gladiolus The Bride and a few yellow Richardias Arums,

the latter being exceptionally fine in quality. Gardenias are increasing in number daily, and prices for these blooms are on the down grade. Tulips at present greatly exceed the demand owing to the very large quantities of outdoor blooms arriving from all quarters. The improved weather conditions have increased the supplies of Roses and Carnations and prices are easier. Lily-of-the-Valley is one of the shortest subjects in this department at the present time. Coloured Gladiolus Blushing Bride and Peach Blossom are much improved in quality, and the small consignments are soon cleared.

**REMARKS.**—Active trade conditions are now ruling in Covent Garden, and the quantities of produce available are on a large scale: most kinds of fruits and vegetables are selling freely. This week's shipments of fruits from South Africa consist mainly of Grapes and Pears, and has gone out well. Similar fruits are coming from Australia and also meeting fairly good trade conditions. Australasian Apples, when in good condition, are popular, the supplies being fairly heavy. A few hothouse Grapes are being marketed from the Worthing district. Forced Strawberries continue to sell well, and the few hothouse Figs that are coming also find buyers at good prices. Choice vegetables, such as Peas, Beans and Guernsey Potatoes, are all a firm market, in spite of very heavy quantities of Asparagus from France, which has been cheap. This latter produce has severely affected the demand for Worcester "Asparagus" which is selling at comparatively low prices. Mushrooms are in good demand just now and their prices are firm. English Tomatoes are gradually increasing in quantity and show a slight depreciation in prices. Cucumbers are plentiful, but there is a firm demand and quotations are inclined to be higher. New Potatoes are ample for the demand, supplies arriving from Spain, the Canary Islands, the Azores and Guernsey. Green vegetables meet a moderate demand, and the trade in old Potatoes is quiet, the best sorts only being inquired for.

## GLASGOW.

**SEVERE** wintry weather had a restricting influence on the turnover of the cut flower market last week, and price movements were narrow round previous low levels. Emperor, Empress and Sir Watkin Daffodils were worth 2/6 to 3/- per dozen, while ornatus varied from 8d. to 1/- for ordinary blooms, and 1/- to 2/- for special outdoor. Tulips were plentiful at 1d. to 3d. per bunch, and indoor specimens of William Copland and William Saunders varied from 6d. to 9d. Carnations continued cheap at 2/6 to 3/6 per dozen. English Irises made 2/- to 2/6 (12's), and Guernsey flowers, 4d. to 8d. per bunch. The value of pink Roses fluctuated between 2/6 and 4/- per dozen; red blooms made 2/6 to 3/6; and white, 2/- to 3/-; English- and Scotch-grown Richardias sold at 2/- to 4/- per dozen; Dutch Richardias at 1/- to 2/-; Lilium longiflorum (Harrisii) sold for 1/6 to 3/- per bunch; Lilac for 1/3 to 1/6; Indoor Lily-of-the-Valley for 2/- to 2/6; outdoor, 9d. to 1/-; and Sweet Peas of mixed colours for 2/-. The market was flooded with bedding plants, for which there was little demand at a low price of 9d. per box. Marguerites and Spiraeas averaged 1/- per pot, and the value of Hydrangeas ranged from 2/- to 3/6 each, according to size.

In the fruit section, Apples were obtainable at former quotations. The last shipment of Jaffa Oranges for the present season, which arrived in the Clyde on Wednesday and was sold by auction on Friday, realised from 16/- to 21/- per case. Valencia counts ranged from 15/- to 30/-. There were further consignments of South African fruit, the prices of which ruled as follow:—Doyenne du Comice Pears, 12/- to 24/-; Winter Nells, 8/6 to 10/-; Beurre Bosc, 9/6 and Glou Morceau, 7/6 to 9/-; Gros Colmar Grapes were worth 1/3 to 1/4 per lb.; Waltham Cross and Red Hanepoot Grapes, 10d. to 1/-.

Daily supplies of new vegetables were plentiful at the following values:—Guernsey Tomatoes, 1/8 per lb.; Asparagus, 1/2 to 1/4 per bunch; Dutch Lettuce, 6d. per dozen; Cucumbers, 3/- to 4/- per dozen; Peas, 5/- to 6/- per boat; Radishes, 2/6 per dozen; Cabbages, 8d. to 1/- per bunch; Sybobs, 2d. to 3d.; Beans, 1/- to 1/3 per lb.; Dutch Carrots, 5d. per bunch; French Carrots, 10d. per bunch; Turnips, 8d. per bunch; Potatoes, No. 2, 15/6 per case; No. 3, 13/6 per case; and Rhubarb, 6/- to 7/- per cwt.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

RAMPTON ESTATE INSTITUTION FOR MENTAL DEFECTIVES, NEAR RETFORD, NOTTS.

**GARDEN NURSE** (female) required. Wages 24s. 6d. per week, rising 1s. to 28s. 6d. per week, plus a war bonus, at present amounting to 19s. 8d. per week, with lodging, washing and uniform. ## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.*

## SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.*

## PRIVATE.

**GARDENER, HEAD**, experienced in all branches, highly recommended; 10 years present place; age 45.—E. SLADE, Plas Fower Gardens, Wrexham.

## Glass Houses—still time to erect for Summer use

**F**ruit—Plants—Flowers. All these can  
be coaxed and nursed into life under  
the protective cover of a well built  
Glass House. But it *mu*t be well built.  
William Duncan Tucker & Sons Ltd.,  
builders of superior Glass Houses in the  
last five reigns, design and erect their  
structures with infinite care and accuracy.  
They know the havoc the weather plays  
on feeble Glass Houses. First wind, then  
bright sunshine, then, perhaps, snow.  
Against such abusive elements what chance  
does a Glass House stand if it be con-

"HARDY PLANTS WORTH GROWING" contains over 600 illustrations from photographs, and much useful information in plain talk on Natural Gardening. Autumn Colours and Winter Berries, Spring Flowering Trees and Shrubs, Plants for Rock, Dell, Glen, Bog and Water Garden, Shrubberies, Pergolas, Bare places under Trees, etc. Copies may be had gratis on application. Orders carriage paid. (Small Town and Villa Gardens not catered for).—V. N. GAUNTLETT & CO., LTD., Japanese Nurseries, Chiddingfold.

STRAWBERRIES can still be planted from small pots to fill gaps or for next season: The Duke, the best early, in pots, 30/- per 100.—LAXTON BROS., Bedford.

SANDERS, ORCHID GROWERS,  
St. Albans.

## FROM SEED

Few plants of present time grown from seed are likely to excite greater, if as much, interest, in the resulting flower as the HYBRID LUPIN. Despite its wonderful advance—its remarkable beauty and variety of colour—the possibility of obtaining other colours, or at least other colour combinations, is still very great, and certainly attractive. From a packet of seed of this invaluable earlier-than-June flower may quite likely emerge other gems. Seed of any of the 15 varieties of our beautiful NORTHERN Strain, 1/6 per pkt. Ask for descriptions.

DICKSON & ROBINSON,

The King's Seedsmen, MANCHESTER.

## PEEDS' HYDRABLU

The finest colorant for Hydrangeas on the market. It transforms the pink Hydrangea into a pleasing shade of blue.

Per lb. 3/-; per 2 lb. 5/9; per  
7 lb. 20/-.

JOHN PEED & SON

The King's Seedsmen and Nurserymen West Norwood London

## NOW IS THE TIME TO ORDER KELWAY'S ATTRACTIVE ANTIRRHINUMS

## DAHLIAS

"Our British Empire" Exhibit of Dahlias during 1924 and 1925 was considered a feature of the Horticultural Section at Wembley.

CATALOGUE ON APPLICATION.

## "ROOT & STEM VEGETABLES"

By the late Alex. Dean, V.M.H.

PRICE 3/- Post Free.

ONE of the famous "Present-Day Gardening" series, edited by the late R. Hooper Pearson, containing eight lovely coloured plates. Only a few of these books now remain, and they are not being reprinted, so that the opportunity of securing one may not be available much longer.

**GARDENERS' CHRONICLE, LTD.**  
5, Tavistock Street, Covent Garden, W.C. 2

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.**  
**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1 cwt., 15/-; ½-cwt., 9/-; 28lb., 5/-; £14 10/- per ton. All Carriage Paid.

**LOOK TO YOUR VINES!**  
The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56lb., 14/-; 28lb., 8/-; All Carriage Paid.

**LAWN MANURE.**  
Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton, £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

**LAWN SAND AND DAISY KILLER.**  
This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid. DIRECTIONS FOR USE.—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

**SUSSEX TRUG BASKETS.**  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

# Ryders

NEW DWARF BEDDING DAHLIAS

Pot roots can be planted right away just as one plants bulbs. The plants form vigorous bushes 15 to 18 inches high. These are covered with masses of single flowers in the most beautiful Dahlia colours. The earliest of all Dahlias, and continues in beauty until frost comes. Dormant pot roots form stronger, larger, and more floriferous plants than those from cuttings. 6 for 4/3 12 for 8/- (in rich variety) carriage paid.

If you have not yet received a copy of Ryders Spring List send a post card to-day to

RYDER & SON (1920) LIMITED

St. Albans

## The Toll of the Frost.

No excuse is needed for a return to a subject which must be uppermost in the minds of gardeners, notwithstanding the delightful weather of early May, and the rapid progress Nature has made in covering up the traces of her own harshness. A point which emerges from the reports of gardeners in different parts of the country is the apparently inconsistent behaviour of certain plants in different gardens, and the escape of others which are not usually considered hardy. The list of these is too long for detailed enumeration, but few experienced gardeners would have expected to see Piptanthus tomentosus emerge from the ordeal unscathed, or Paeonia Emodi, in full flower; Paeonia Witmanniana is sometimes cut down in a severe spring, but showed no sign of hurt in the recent frost, nor did the Majorcan P. Cambessedesii. On the other hand, the hybrid tree Paeonies suffered as they usually do, while P. lutea was slightly scorched and P. Delavayi not at all. A seven-year-old plant of Azara microphylla, which bore the bitter easterly winds of the spring of 1926, is now entirely blackened. In one garden Cistus ladaniferus is unharmed,

while Philadelphus Wilsonii, Hamamelis mollis and Styrax Hemsleyanum, close to it, have been stripped of their foliage. The same thing has happened to Davidia involucrata and D. Vilmoriniana for the second year in succession, and Nothofagus cliffortioides is every colour of the rainbow. Pieris taiwanensis had a very narrow escape, and Osmanthus Forrestii has parted with all last year's growth. In this case, however, the plants are only eighteen inches high and not out of the nursery stage, so the test may not be a fair one. Osmanthus Delavayi is serene, though it was severely cut by the east winds of April, 1926. Neither Viburnum Carlesii, V. bitchiense nor V. fragrans seem to have suffered, and, wonderful to relate, Carpenteria and Fremontia are unscathed. Daphne Blagayana, in flower, maintains its reputation for hardiness, but neither Arctostaphylos Manzanita, Tricuspidaria dependens nor Trochodendron look as if they would recover. The most astonishing contradictions, however, are, perhaps, to be found among Lilies, for three of the species with robust constitutions have suffered most. From many parts of the country come reports of the remarkable discomfiture of L. regale, which is usually reckoned one of the hardiest of the genus. It has been cut down right and left in hundreds. L. Henryi is not in much better case, and L. giganteum has lost its larger leaves; not many living gardeners can have seen that before. L. centifolium has also suffered. None of the other species seems to have come to any harm except the Formosan form of L. philippinense. L. Willmottiae and L. Davidii stand serene, in one instance over the prostrate forms of L. regale, as if to point the moral. The bulbs should be strengthened by the premature destruction of the stems. At such times the generally accepted standards of hardiness go by the board, for in the majority of cases it is the new growth alone of plants which has been damaged, the old growth remaining unharmed, as indeed, it remains in winter frosts of far greater intensity. The common Laurel is an example, for that will bear a very severe winter frost; yet the new shoots curled up in the last week of April. No doubt certain broad facts would emerge from carefully collated reports from gardens in all districts, but the contradictory character of the reports about the behaviour of identical plants in different places militates against the formation of definite conclusions, except, perhaps, that such visitations are a national calamity.

**A Discussion on the Recent Frosts.**—At the meeting of the R.H.S. Fruit and Vegetable Committee on Tuesday last, the Chairman, Mr. A. H. Pearson, said it would be interesting if those present gave their experiences of the damage done by the recent frosts. Mr. E. A. Bunyard stated that in his district there were 10° of frost, and the anthers and pistils of Apples were, in most cases, entirely destroyed, and even in the bud stage the pistils were badly affected. Of Strawberries the White Pine variety, which retains all its leaves in winter, was practically uninjured and hardly a bloom had been damaged. He stated that the flavour of this old variety was very good, and in view of its hardiness it was a promising parent for raising a new variety. He was surprised at the hardiness of Pears. One member stated that a hedge of Cupressus Lawsoniana was entirely destroyed by the frost. Mr. E. Beckett stated that Roses especially had suffered severely, and he believed that fifty per cent. of the Roses at Aldenham were killed. Mr. Laxton said that maiden Roses in his nursery looked "very sick." Mr. A. H. Pearson reported that at Lowdham the Rose bushes were killed half way down the stem, but that the buds in the lower part,

even those in growth, were not affected. Mr. J. Cheal stated that the young growth of Yew was untouched, but all that of Box looked as if it had been singed. It was the common experience of the members that whilst many reputedly hardy plants had suffered badly, for instance, Ivy on walls, and the common Laurel, other plants which might have been expected to be more tender, such as Moutan Paeonies, were not touched. It was reported that at Wisley there was 16° of frost; the plants in the high lands had escaped, but those in hollows and the lower parts of the garden were much damaged. The trial of Black Currants, and especially those of the Baldwin type, was so badly crippled that the trial would be useless this year, but, interestingly enough, Red Currants seemed but little affected. The general experience of the members was that the damage was most severe in the case of plants growing close to the ground, such as Strawberries and Gooseberries.

**Bluebells and Lilac at Kew.**—Among the many attractions offered at present by the Royal Gardens, Kew, two stand out particularly because of their extent and the strong appeal they make to the general public; these are Bluebells in the Queen's Cottage ground, and the Lilacs near the Temperate House and in other parts of the gardens. The Bluebells are a never failing source of interest, and although the flowers may vary a little in numbers and quality from year to year, they never fail to produce a scene that is at once very beautiful and very English. The great carpet of blue seen on a bright day when there is a fine play of light and shade, as the fresh greenery of the trees is moved by the April breezes and filters the sunshine, is worth going a long way to see. In addition to species of Lilac (Syringa), Kew has a fine collection of garden varieties of this graceful and fragrant flower. Her Majesty Queen Mary rarely fails to pay one or more visits to Kew during Bluebell time, and only a few days ago she was one of many who found delight in this homely woodland flower.

**Cider-Testing at Long Ashton.**—On Thursday, May 5, a large number of visitors attended the Research Station at Long Ashton in connection with the Cider-testing and Cider Competitions held annually at this station. After the sampling of the Ciders the visitors were shown the experimental work in progress in the plantations and laboratories and the more important points were demonstrated to them. There were five classes for Ciders and one for Perry, and the number of entries was surprisingly high, considering the limited crop of cider Apples last season. The programme included conducted tours through the plantations, where the pruning and shaping of trees, fruit breeding, trials of Apple stocks, manuring, and Strawberry investigations were inspected, and demonstrations given of tractors and spraying machines.

**Gardens and Queen Alexandra Memorial.**—We are asked to point out that applications for lists of the gardens to be opened for inspection on behalf of Queen Alexandra Memorial Fund should be addressed, not to Mr. F. H. Mitchell, but to the General Secretary, Mr. Lloyd-Warren, 28, Windsor House, Victoria Street.

**Flora of the Highlands of Central Abyssinia.**—An interesting account of his travels in Abyssinia was given by Dr. Hugh Scott at the recent meeting of the Linnean Society. Dr. H. Scott went to Abyssinia for the purpose of studying the insect fauna, and so far as possible the flora of the highlands of Central Abyssinia. The fauna and flora of this region are of peculiar interest as they are those of a large, well-watered elevated country in the heart of Africa, isolated from surrounding regions by low-lying desert or semi-desert tracts; and they exhibit a remarkable blend of Palaeartic, Ethiopian and Oriental elements. No systematic collecting of small insects had previously been done in this part of Abyssinia. The expedition set out from Addis Ababa, the capital, over 8,000 feet above sea-level, and by trekking with mule caravan and camping during many weeks, several very different types of country, lying at elevations between 5,500 and 12,000 feet, were visited.

## The Toll of the Frost.

No excuse is needed for a return to a subject which must be uppermost in the minds of gardeners, notwithstanding the delightful weather of early May, and the rapid progress Nature has made in covering up the traces of her own harshness. A point which emerges from the reports of gardeners in different parts of the country is the apparently inconsistent behaviour of certain plants in different gardens, and the escape of others which are not usually considered hardy. The list of these is too long for detailed enumeration, but few experienced gardeners would have expected to see Piptanthus tomentosus emerge from the ordeal unscathed, or Paeonia Emodi, in full flower; Paeonia Witmanniana is sometimes cut down in a severe spring, but showed no sign of hurt in the recent frost, nor did the Majorcan P. Cambessedesii. On the other hand, the hybrid tree Paeonies suffered as they usually do, while P. lutea was slightly scorched and P. Delavayi not at all. A seven-year-old plant of Azara microphylla, which bore the bitter easterly winds of the spring of 1926, is now entirely blackened. In one garden Cistus ladaniferus is unharmed,

while Philadelphus Wilsonii, Hamamelis mollis and Styrax Hemsleyanum, close to it, have been stripped of their foliage. The same thing has happened to Davidia involucrata and D. Vilmoriniana for the second year in succession, and Nothofagus cliffortioides is every colour of the rainbow. Pieris taiwanensis had a very narrow escape, and Osmanthus Forrestii has parted with all last year's growth. In this case, however, the plants are only eighteen inches high and not out of the nursery stage, so the test may not be a fair one. Osmanthus Delavayi is serene, though it was severely cut by the east winds of April, 1926. Neither Viburnum Carlesii, V. bitchiense nor V. fragrans seem to have suffered, and, wonderful to relate, Carpenteria and Fremontia are unscathed. Daphne Blagayana, in flower, maintains its reputation for hardiness, but neither Arctostaphylos Manzanita, Tricuspidaria dependens nor Trochodendron look as if they would recover. The most astonishing contradictions, however, are, perhaps, to be found among Lilies, for three of the species with robust constitutions have suffered most. From many parts of the country come reports of the remarkable discomfiture of L. regale, which is usually reckoned one of the hardiest of the genus. It has been cut down right and left in hundreds. L. Henryi is not in much better case, and L. giganteum has lost its larger leaves; not many living gardeners can have seen that before. L. centifolium has also suffered. None of the other species seems to have come to any harm except the Formosan form of L. philippinense. L. Willmottiae and L. Davidii stand serene, in one instance over the prostrate forms of L. regale, as if to point the moral. The bulbs should be strengthened by the premature destruction of the stems. At such times the generally accepted standards of hardiness go by the board, for in the majority of cases it is the new growth alone of plants which has been damaged, the old growth remaining unhurt, as indeed, it remains in winter frosts of far greater intensity. The common Laurel is an example, for that will bear a very severe winter frost; yet the new shoots curled up in the last week of April. No doubt certain broad facts would emerge from carefully collated reports from gardens in all districts, but the contradictory character of the reports about the behaviour of identical plants in different places militates against the formation of definite conclusions, except, perhaps, that such visitations are a national calamity.

**A Discussion on the Recent Frosts.**—At the meeting of the R.H.S. Fruit and Vegetable Committee on Tuesday last, the Chairman, Mr. A. H. Pearson, said it would be interesting if those present gave their experiences of the damage done by the recent frosts. Mr. E. A. Bunyard stated that in his district there were 10° of frost, and the anthers and pistils of Apples were, in most cases, entirely destroyed, and even in the bud stage the pistils were badly affected. Of Strawberries the White Pine variety, which retains all its leaves in winter, was practically uninjured and hardly a bloom had been damaged. He stated that the flavour of this old variety was very good, and in view of its hardiness it was a promising parent for raising a new variety. He was surprised at the hardiness of Pears. One member stated that a hedge of Cupressus Lawsoniana was entirely destroyed by the frost. Mr. E. Beckett stated that Roses especially had suffered severely, and he believed that fifty per cent. of the Roses at Aldenham were killed. Mr. Laxton said that maiden Roses in his nursery looked "very sick." Mr. A. H. Pearson reported that at Lowdham the Rose bushes were killed half way down the stem, but that the buds in the lower part,

even those in growth, were not affected. Mr. J. Cheal stated that the young growth of Yew was untouched, but all that of Box looked as if it had been singed. It was the common experience of the members that whilst many reputedly hardy plants had suffered badly, for instance, Ivy on walls, and the common Laurel, other plants which might have been expected to be more tender, such as Moutan Paeonies, were not touched. It was reported that at Wisley there was 16° of frost; the plants in the high lands had escaped, but those in hollows and the lower parts of the garden were much damaged. The trial of Black Currants, and especially those of the Baldwin type, was so badly crippled that the trial would be useless this year, but, interestingly enough, Red Currants seemed but little affected. The general experience of the members was that the damage was most severe in the case of plants growing close to the ground, such as Strawberries and Gooseberries.

**Bluebells and Lilac at Kew.**—Among the many attractions offered at present by the Royal Gardens, Kew, two stand out particularly because of their extent and the strong appeal they make to the general public; these are Bluebells in the Queen's Cottage ground, and the Lilacs near the Temperate House and in other parts of the gardens. The Bluebells are a never failing source of interest, and although the flowers may vary a little in numbers and quality from year to year, they never fail to produce a scene that is at once very beautiful and very English. The great carpet of blue seen on a bright day when there is a fine play of light and shade, as the fresh greenery of the trees is moved by the April breezes and filters the sunshine, is worth going a long way to see. In addition to species of Lilac (Syringa), Kew has a fine collection of garden varieties of this graceful and fragrant flower. Her Majesty Queen Mary rarely fails to pay one or more visits to Kew during Bluebell time, and only a few days ago she was one of many who found delight in this homely woodland flower.

**Cider-Testing at Long Ashton.**—On Thursday, May 5, a large number of visitors attended the Research Station at Long Ashton in connection with the Cider-testing and Cider Competitions held annually at this station. After the sampling of the Ciders the visitors were shown the experimental work in progress in the plantations and laboratories and the more important points were demonstrated to them. There were five classes for Ciders and one for Perry, and the number of entries was surprisingly high, considering the limited crop of cider Apples last season. The programme included conducted tours through the plantations, where the pruning and shaping of trees, fruit breeding, trials of Apple stocks, manuring, and Strawberry investigations were inspected, and demonstrations given of tractors and spraying machines.

**Gardens and Queen Alexandra Memorial.**—We are asked to point out that applications for lists of the gardens to be opened for inspection on behalf of Queen Alexandra Memorial Fund should be addressed, not to Mr. F. H. Mitchell, but to the General Secretary, Mr. Lloyd-Warren, 28, Windsor House, Victoria Street.

**Flora of the Highlands of Central Abyssinia.**—An interesting account of his travels in Abyssinia was given by Dr. Hugh Scott at the recent meeting of the Linnean Society. Dr. H. Scott went to Abyssinia for the purpose of studying the insect fauna, and so far as possible the flora of the highlands of Central Abyssinia. The fauna and flora of this region are of peculiar interest as they are those of a large, well-watered elevated country in the heart of Africa, isolated from surrounding regions by low-lying desert or semi-desert tracts; and they exhibit a remarkable blend of Palaearctic, Ethiopian and Oriental elements. No systematic collecting of small insects had previously been done in this part of Abyssinia. The expedition set out from Addis Ababa, the capital, over 8,000 feet above sea-level, and by trekking with mule caravan and camping during many weeks, several very different types of country, lying at elevations between 5,500 and 12,000 feet, were visited.

They included the primeval forest of Djem-Djem, composed mainly of giant Juniper trees; Mount Zuquila, an extinct volcano with a lake in its crater, and covered with giant Heaths and other interesting vegetation; the plains southwards to Lake Zwai, a region of dry bush and thorn-scrub; the park-like country, forest and Heath-land of Mount Chillalo; and the Muger Valley, a great chasm more than 2,000 feet deep, with precipitous sides. The lantern slides shown illustrated the different kinds of country and vegetation (especially the curious mixture of temperate and distinctly African plants frequently met with), as well as some aspects of the human life of Abyssinia.

**Interesting Pictures and Plants of Kew.**—A collection of pictures and plants relating to the village of Kew and the early history of the Botanic Gardens during the latter part of the eighteenth century has been hung in Kew Palace. For some time the collection has been exhibited amongst the botanical pictures in Museum 3, but here they were only available for the inspection of a few. The pictures relate to the period when Her Majesty Queen Caroline, H.R.H. the Princess of Wales (Augusta of Saxe-Gotha), the Earl of Bute, H.M. King George III, and Sir Joseph Banks took a great interest in the Royal Gardens, and when Sir William Chambers was engaged to design several of the buildings.

**Hamburg Horticultural Union.**—During Easter week the Horticultural Union for Hamburg, Altona and district, held, in Altona, a spring flower show. In spite of heavy business just previously, and consequent shortage of material, the local nurserymen sent very fine exhibits; the bulbs grown in the open, however, were not quite ready, and the Darwin Tulips especially did not make the fine colour-display which usually distinguishes them. Narcissi, on the other hand, were in full beauty, and the firm of Hufeld, of Darmstadt, had an impressive exhibit, including *N. poeticus ornatus*, *N. Cervantes*, *N. Silver Queen* and others. Mr. Wilhelm Pfitzer, Stuttgart, showed a *Gladiolus* garden which was very effective. The weather was perfect for the time of year, and, in consequence, visitors were very numerous, and the exhibition was in every way a success.

**High Price for a Cherry Orchard.**—It is the practice in the Cherry-growing districts of Kent to sell the orchards at this time of the year, and although it is so very early in the season, experienced buyers can tell with a measure of certainty what the result of the crop is likely to be. On Friday, April 29, an orchard of twenty-and-a-half acres, situated at Teynham, made the high price of £9,125, which works out at over £450 per acre. As there was frost amounting to 13° in some parts of Kent on April 27, the venture would seem to be somewhat speculative, but doubtless the buyers were perfectly satisfied that a good crop had set and was beyond the stage when the fruits were likely to be ruined by frost. Some of the finest Cherries are grown in the Teynham district, where these fruits have been cultivated since the reign of Henry VIII.

**The Rosery at Ghent.**—In the pretty park which occupies the site of the ancient Citadel at Ghent, in Belgium, there is a rosery, which was commenced in 1911, and largely furnished by a number of French Rose-growers, who sent many thousands of trees as part of their contribution to the Ghent Quinquennial Exhibition of 1913. Since that time many of the original trees have died, but it is now proposed to restore the Rosery, and the Society, "Les Amis de la Rose," has undertaken to supply the necessary material. The planning and arrangement will be in the hands of M. H. de Wilde, the Ghent Director of Public Parks.

**Cold Weather in the North.**—This has been a very trying season in the north of Scotland, writes a northern correspondent. Rain, sleet, hail, snow and severe frosts have played sad havoc over the whole countryside in gardens, nurseries and fields, and nowhere is this more pronounced than in the fair and early district

of Morayland, well-named the Garden of Scotland. Fruit blossom—Plum, Pear and Cherry—has suffered severely owing to the frost. Apple blossoms, in some cases, were not very far advanced, but much has doubtless been damaged. Hard frosts during the closing days of April cannot fail to have a disastrous effect on the fruit crops. In gardens, the spring flowers have been seared, and young plants just coming through the ground from early-sown seed, have been withered. Early Potatoes have also suffered severely. Not since so far back as 1877 has such Arctic weather been experienced in the north during the closing days of April and the advent of May.

**Mr. George Angus.**—Inverness is to be congratulated upon securing the services of Mr. George Angus as Superintendent of the Corporation's Parks and Cemeteries, an appointment he takes up during the present month. Mr. Angus has the requisite qualifications for his new post, and was chosen unanimously from a short list of able men. For many years he

MR. GEORGE ANGUS.

served as general foreman at Drumlanrig Castle, under the late Mr. Inglis, who was a great gardener and organiser. Mr. Angus left Drumlanrig to take charge of the Hon. Mrs. Merry's gardens at Balladrum, which includes one of the most extensive flower gardens in the north of Scotland. He served in France with the Scots Guards during the war, and as he is still a young man he promises to adorn the horticultural profession for many years to come.

**Trials of Fuchsias at Wisley.**—The Royal Horticultural Society invites growers to send varieties of Fuchsia, both hardy and for growing under glass, to its Gardens at Wisley for trial during the present season. Three plants of each variety should be sent to reach the Director R.H.S. Gardens, Wisley, Ripley, Surrey (Horsley Station, Southern Railway), on or before May 31, 1927.

**Inspection and Certification of Strawberry Plants.**—The Ministry of Agriculture and Fisheries, on the recommendation of its Horticultural Advisory Council, proposes to set up a voluntary scheme of inspection and certification of Strawberry plants, which will be useful in the case of sales of stocks. Plants from which runners are intended to be taken for sale will, on application by growers, be inspected and certified if they are found to be true to variety. Present knowledge of certain of the diseases of Strawberries is insufficient to enable the Department to certify entire freedom from them, but certificates will not be issued for stocks which are obviously

unhealthy. Lists of growers holding certificates in respect of Strawberry stocks will be published at the end of the inspection season so that purchasers may be informed of them. Growers who wish to avail themselves of the facilities offered under this scheme should make application to the Secretary of the Ministry, 10, Whitehall Place, London, S.W.1, before May 31. A fee of 7s. 6d. per acre or part of an acre of Strawberry plants inspected will be charged for each inspection, with an additional charge of 1s. per certificate, and 3d. for each copy certificate.

**Visitors to Kew in 1926.**—According to the *Journal of the Kew Guild*, the total number of visitors to the Royal Botanic Gardens, Kew, during 1926, was 1,162,547, a decrease of 509,293 on the figures of the previous year. Doubtless the decreased attendance is the result of the reimposition of the charge of one penny for admission. It seems a great pity to deny over half-a-million people the pleasure of visiting these national gardens, and although the sum charged is but a trifle, poor persons with large families would find it a heavy tax.

**"Tribune Horticole."**—Our Belgian contemporary, *La Tribune Horticole*, for May 7, contains a portrait and a generous appreciation of the Managing Editor of *The Gardeners' Chronicle*, Mr. Charles H. Curtis. This excellent little paper, which was temporarily suspended during the war, has now regained all its former well-deserved popularity.

**Conference on Labels and Labelling.**—A Conference on Labels and Labelling will be held in the Conference Tent at the Chelsea Show on Thursday, May 26th, at 2.30 p.m. Mr. Mark Fenwick, J.P., will preside, and Mr. H. Gilbert-Carter, M.A., the Director of the University Botanic Garden, Cambridge, will open the discussion, followed by a contribution by Mr. A. Bruce Jackson, A.L.S., and Mr. A. Grove, F.L.S. A discussion will take place, and visitors attending the Conference will be allowed to express their views within the limitation of the time at the disposal of the Chairman. A small representative exhibit of labels will be placed in the tent.

**New Public Park at Stuttgart.**—For a long time the authorities at Stuttgart have been considering the question of taking over the park at Meierei Rosenstein, which occupies a space of seventy hectares, for a public pleasure ground, and also forming a zoological garden in connection therewith. The park has now been thrown open, but the other question is still in abeyance. The park occupies one of the finest positions in Stuttgart, and hitherto a fee of fifty pfennigs (half-a-mark) has been charged for admission. It is beautifully furnished with valuable old trees, and adjoins the Botanic Garden, which has also been made over to the public, who may now freely visit it without charge.

**"Dahlia Year Book."**—The *Dahlia Year Book* for 1927 is the best the Society has published for very many years, and we congratulate both the Society and Mr. W. J. Chittenden, the Editor, on contributing such a useful volume to the literature of the Dahlia. The frontispiece is a portrait of Mr. D. B. Crane, the Hon. Treasurer of the National Dahlia Society, and a very keen amateur florist generally; he has been for upwards of thirty years a member of the Floral Committee of the National Chrysanthemum Society. Amongst the many excellent articles are "The Dahlia as a Garden Flower and for Cutting," by Mr. A. E. Townsend; "Some Commercial Aspects of Dahlia Culture," by Mr. Alfred Vasey; "Dahlias in the Kew Herbarium," by Mr. J. Fraser, V.M.H.; "Notes on Dahlia Novelties of Last Season," by Mr. J. B. Riding; "Dahlias as Plants for Tubs," by Mr. Hugh A. Pettigrew; and a series of articles on Dahlias in Public Parks, by Mr. W. H. Johns, Capt. B. H. MacLaren, Mr. F. G. Cousins, Mr. W. W. Pettigrew and Mr. J. T. Jeffrey. There is an excellent portrait of Mr. T. Hay, the Superintendent of Hyde Park, who has done so much to popularise the Dahlia

as a plant for public parks and gardens. Comments on the Dahlia Show of 1926; notes on the Dahlias selected for trial at Wisley in 1926, and the report of the Committee of the National Dahlia Society for 1926 will all be read with interest. We are glad to see that the Society is in a better financial position than for very many years, for on November 10, 1926, there was a balance in hand of £123 15s. 7d., whilst the balance of assets over liabilities amounted to £118 19s. 7d.

**Importation of Potatoes (Canary Islands) Order of 1927.**—In view of the discovery of the Potato Moth in consignments of Potatoes imported this season from the Canary Islands, the Minister of Agriculture and Fisheries has made an Order under the Destructive Insects and Pests Acts 1879 and 1907, prohibiting the landing in England and Wales of any Potatoes grown in the Canary Islands unless they are accompanied by the certificate of health prescribed in the Destructive Insects and Pests Order of 1922. The Order came into operation on May 2, but it allows for the landing of Potatoes shipped from the Canary Islands prior to that date.

**Frauds on German Gardeners.**—In prison at Erfurt, there is a man who last year carried out a colossal swindle by which thousands of gardeners and nursery employees suffered. Under the name of "Thüringer-Pflanzenkulturen," he advertised in about three-hundred newspapers young fruit trees, bulbs, bushes, and most of all, Potatoes, at fabulously low prices, demanding payment in advance, and sacks in which to send the Potatoes. In a few days he had received at his office 10,000 marks in money, and huge piles of sacks! It was only by a fortunate chance that the Police detected the swindle and arrested the rogue.

**Hawksmoor Nature Reserve.**—An estate of about 207 acres, situated some 600 feet above sea-level, near Cheadle, has been acquired for the nation by the National Trust. The estate consists of plantations, moorland, marshes and valleys and, with its wealth of wild flowers, forms a picturesque area in Staffordshire, midway between Cheadle and Oakmoor. It is the resort of several rare birds, and one of the objects of the National Trust in acquiring the estate has been to make it a sanctuary and a place for the preservation of animal life. The birds met with there include the bittern, dipper, water rail and sandpiper. The cost of the property was £1,200, which was raised by public subscription; the management will be invested in the North Staffordshire Field Club, under the auspices of the National Trust.

**A New Order on the Sale of Diseased Plants.**—The new order issued by the Ministry of Agriculture, entitled, "The Sale of Diseased Plants Order of 1927," came into force on April 25, and prohibits the sale or exposure for sale of any plant which bears evidence of having been substantially attacked by the Apple Capsid, or of any trees, shrubs, seeds, tubers, bulbs, layers, cuttings or any other parts of a plant which are substantially attacked by the following pests:—Fruit Tree Cankers, American Gooseberry Mildew, Silver Leaf, Black Currant Mite, Woolly Aphis, all Scale Insects, Brown Tail Moth, Rhododendron Bug, and Powdery or Corky Scab of Potatoes. The reason for the Order is the serious complaints that have been made to the Ministry during the past few months of the increase of the Capsid Bug on Apple trees in certain districts. The need for a drastic Order was strongly urged, and the Ministry, after full consideration of the advice of its Horticultural Advisory Council, decided that the most practicable method of dealing with the matter was to add the pest to the Schedule to the Sale of Diseased Plants Order of 1922. The opportunity was taken of making other small amendments of the regulations, and the new Order is the result.

**German Nursery Employee's Long Service.**—Franz Wieschke, the head gardener in the nursery of Mr. J. C. Schmidt, Erfurt, celebrated, on April 1, the completion of fifty years' service with the firm. It was on April 1, 1877, that he began work as an assistant in the pot-plant department,

where he showed such zeal that he was soon promoted, and as the firm grew in size and importance, his own position steadily improved. He still has the entire confidence of his employers, who celebrated the fifty-years' jubilee by a "festive breakfast," at which several members of the firm were present and congratulated him warmly, also handing to him a message of greeting from the President of the Reich, signed by his own hand.

**The Gardeners' Royal Benevolent Institution.**—The Committee of this Charity is distributing in grants this year from the Victorian Era Fund and the Geo. Monro Memorial Fund sums amounting to £226 to the candidates who were unsuccessful in securing election as pensioners in January last.

**Appointments for the Ensuing Week.**—WEDNESDAY, MAY 18: Royal Gardeners' Orphan Fund meeting. FRIDAY, MAY 20:

four in the morning the approaches to the garden were crowded with some thirty or forty caravans, and till half-past-eight, the hour of closing the gates, the stream of such vehicles continued to flow. A lady, celebrated for her horticultural enthusiasm, sent nineteen caravans full; sixteen horses were required to drag the contributions of another exhibitor, and thus the tents were filled; and not only the exhibition tents, but every other tent in the Garden. Of the plants themselves, our reporter has given ample details. Here glowed a forest of Chinese Azaleas, too brilliant to be steadily looked at; there arose a long bank of Orchids, perfuming the air and delighting the observer with their tender colours and extraordinary forms; one tent was redolent of Roses; another sparkled with the enamelled blossoms of the Cape Heaths; in a third, Australia presented the fairest and gayest children of her golden soil. Many novelties also made their first appearance, conspicuous among which were the Mysore Hexacentris,

FIG. 158.—RHODODENDRON RUSSATUM.

R.H.S. Award of Merit, Rhododendron Show, May 3. Flowers purplish-blue. Shown by Mr. A. N. Williams, Werrington Park, Launceston. (see p. 328).

Manchester and North of England Orchid Society's meeting; Royal Gardeners' Orphan Fund Annual Festival Dinner at the Hotel Victoria. SATURDAY, MAY 21: Wakefield and North of England Tulip Society's show (four days.).

**"Gardeners' Chronicle" Seventy-five Years Ago.**—Exhibits at Chiswick Gardens.—Saturday, May 8, 1852, will long be celebrated in the annals of horticultural exhibitions. Such a mass of noble plants as was then produced at Chiswick no one ever saw before. Accustomed as we have long been to displays of the kind, and especially to those in May, we must own that we were as agreeably surprised as our neighbours. It was known that Mr. Rucker would not show Orchids, and that part of the exhibition was looked to with doubt. He did not show; yet such was the vast display of noble specimens that he was not missed. It was expected that Pelargoniums would be behind-hand, owing to the season, and yet the place assigned to those plants was full to overflowing. At

whose gaudy red and yellow flowers were shown to advantage by a graceful twining habit; Saxe-Gothaea, worthy of its illustrious name, which, together with Fitzroya, is expected to rank among the finest hardy exotic Coniferous trees, and a charming little Azalea, called amoena, just introduced by Mr. Fortune, from China, and said to be as hardy as Rhododendron ferrugineum, which it resembles. The air was warm and the day propitious; but the trees were almost leafless, and the turf and shrubberies were browned by the long, cold, rainless weather, so that the lovers of flower shows might be well excused for deferring their visit till a later day. Nevertheless, the visitors amounted, exclusive of exhibitors, to 2,755, who thoroughly enjoyed the most admirable display of horticultural skill which has ever yet been seen. *Gard. Chron.*, May 15, 1852.

**Publications Received.**—*The Low Road: Hardy Heathers and the Heather Garden*, by D. Fyfe Maxwell; Sweet and Maxwell, 2 and 3, Chancery Lane, W.C.2. Price 6/6 net.

They included the primeval forest of Djem-Djem, composed mainly of giant Juniper trees; Mount Zuguila, an extinct volcano with a lake in its crater, and covered with giant Heaths and other interesting vegetation; the plains southwards to Lake Zwai, a region of dry bush and thorn-scrub; the park-like country, forest and Heath-land of Mount Chillalo; and the Muger Valley, a great chasm more than 2,000 feet deep, with precipitous sides. The lantern slides shown illustrated the different kinds of country and vegetation (especially the curious mixture of temperate and distinctly African plants frequently met with), as well as some aspects of the human life of Abyssinia.

**Interesting Pictures and Plants of Kew.**—A collection of pictures and plants relating to the village of Kew and the early history of the Botanic Gardens during the latter part of the eighteenth century has been hung in Kew Palace. For some time the collection has been exhibited amongst the botanical pictures in Museum 3, but here they were only available for the inspection of a few. The pictures relate to the period when Her Majesty Queen Caroline, H.R.H. the Princess of Wales (Augusta of Saxe-Gotha), the Earl of Bute, H.M. King George III, and Sir Joseph Banks took a great interest in the Royal Gardens, and when Sir William Chambers was engaged to design several of the buildings.

**Hamburg Horticultural Union.**—During Easter week the Horticultural Union for Hamburg, Altona and district, held, in Altona, a spring flower show. In spite of heavy business just previously, and consequent shortage of material, the local nurserymen sent very fine exhibits; the bulbs grown in the open, however, were not quite ready, and the Darwin Tulips especially did not make the fine colour-display which usually distinguishes them. Narcissi, on the other hand, were in full beauty, and the firm of Hufeld, of Darmstadt, had an impressive exhibit, including *N. poeticus ornatus*, *N. Cervantes*, *N. Silver Queen* and others. Mr. Wilhelm Pfitzer, Stuttgart, showed a *Gladiolus* garden which was very effective. The weather was perfect for the time of year, and, in consequence, visitors were very numerous, and the exhibition was in every way a success.

**High Price for a Cherry Orchard.**—It is the practice in the Cherry-growing districts of Kent to sell the orchards at this time of the year, and although it is so very early in the season, experienced buyers can tell with a measure of certainty what the result of the crop is likely to be. On Friday, April 29, an orchard of twenty-and-a-half acres, situated at Teynham, made the high price of £9,125, which works out at over £450 per acre. As there was frost amounting to 13° in some parts of Kent on April 27, the venture would seem to be somewhat speculative, but doubtless the buyers were perfectly satisfied that a good crop had set and was beyond the stage when the fruits were likely to be ruined by frost. Some of the finest Cherries are grown in the Teynham district, where these fruits have been cultivated since the reign of Henry VIII.

**The Rosery at Ghent.**—In the pretty park which occupies the site of the ancient Citadel at Ghent, in Belgium, there is a rosery, which was commenced in 1911, and largely furnished by a number of French Rose-growers, who sent many thousands of trees as part of their contribution to the Ghent Quinquennial Exhibition of 1913. Since that time many of the original trees have died, but it is now proposed to restore the Rosery, and the Society, "Les Amis de la Rose," has undertaken to supply the necessary material. The planning and arrangement will be in the hands of M. H. de Wilde, the Ghent Director of Public Parks.

**Cold Weather in the North.**—This has been a very trying season in the north of Scotland, writes a northern correspondent. Rain, sleet, hail, snow and severe frosts have played sad havoc over the whole countryside in gardens, nurseries and fields, and nowhere is this more pronounced than in the fair and early district

of Morayland, well-named the Garden of Scotland. Fruit blossom—Plum, Pear and Cherry—has suffered severely owing to the frost. Apple blossoms, in some cases, were not very far advanced, but much has doubtless been damaged. Hard frosts during the closing days of April cannot fail to have a disastrous effect on the fruit crops. In gardens, the spring flowers have been seared, and young plants just coming through the ground from early-sown seed, have been withered. Early Potatoes have also suffered severely. Not since so far back as 1877 has such Arctic weather been experienced in the north during the closing days of April and the advent of May.

**Mr. George Angus.**—Inverness is to be congratulated upon securing the services of Mr. George Angus as Superintendent of the Corporation's Parks and Cemeteries, an appointment he takes up during the present month. Mr. Angus has the requisite qualifications for his new post, and was chosen unanimously from a short list of able men. For many years he

MR. GEORGE ANGUS.

served as general foreman at Drumlanrig Castle, under the late Mr. Inglis, who was a great gardener and organiser. Mr. Angus left Drumlanrig to take charge of the Hon. Mrs. Merry's gardens at Balladrum, which includes one of the most extensive flower gardens in the north of Scotland. He served in France with the Scots Guards during the war, and as he is still a young man he promises to adorn the horticultural profession for many years to come.

**Trials of Fuchsias at Wisley.**—The Royal Horticultural Society invites growers to send varieties of Fuchsia, both hardy and for growing under glass, to its Gardens at Wisley for trial during the present season. Three plants of each variety should be sent to reach the Director R.H.S. Gardens, Wisley, Ripley, Surrey (Horsley Station, Southern Railway), on or before May 31, 1927.

**Inspection and Certification of Strawberry Plants.**—The Ministry of Agriculture and Fisheries, on the recommendation of its Horticultural Advisory Council, proposes to set up a voluntary scheme of inspection and certification of Strawberry plants, which will be useful in the case of sales of stocks. Plants from which runners are intended to be taken for sale will, on application by growers, be inspected and certified if they are found to be true to variety. Present knowledge of certain of the diseases of Strawberries is insufficient to enable the Department to certify entire freedom from them, but certificates will not be issued for stocks which are obviously

unhealthy. Lists of growers holding certificates in respect of Strawberry stocks will be published at the end of the inspection season so that purchasers may be informed of them. Growers who wish to avail themselves of the facilities offered under this scheme should make application to the Secretary of the Ministry, 10, Whitehall Place, London, S.W.1, before May 31. A fee of 7s. 6d. per acre or part of an acre of Strawberry plants inspected will be charged for each inspection, with an additional charge of 1s. per certificate, and 3d. for each copy certificate.

**Visitors to Kew in 1926.**—According to the *Journal of the Kew Guild*, the total number of visitors to the Royal Botanic Gardens, Kew, during 1926, was 1,162,547, a decrease of 509,293 on the figures of the previous year. Doubtless the decreased attendance is the result of the reimposition of the charge of one penny for admission. It seems a great pity to deny over half-a-million people the pleasure of visiting these national gardens, and although the sum charged is but a trifle, poor persons with large families would find it a heavy tax.

**"Tribune Horticole."**—Our Belgian contemporary, *La Tribune Horticole*, for May 7, contains a portrait and a generous appreciation of the Managing Editor of *The Gardeners' Chronicle*, Mr. Charles H. Curtis. This excellent little paper, which was temporarily suspended during the war, has now regained all its former well-deserved popularity.

**Conference on Labels and Labelling.**—A Conference on Labels and Labelling will be held in the Conference Tent at the Chelsea Show on Thursday, May 26th, at 2.30 p.m. Mr. Mark Fenwick, J.P., will preside, and Mr. H. Gilbert-Carter, M.A., the Director of the University Botanic Garden, Cambridge, will open the discussion, followed by a contribution by Mr. A. Bruce Jackson, A.L.S., and Mr. A. Grove, F.L.S. A discussion will take place, and visitors attending the Conference will be allowed to express their views within the limitation of the time at the disposal of the Chairman. A small representative exhibit of labels will be placed in the tent.

**New Public Park at Stuttgart.**—For a long time the authorities at Stuttgart have been considering the question of taking over the park at Meierei Rosenstein, which occupies a space of seventy hectares, for a public pleasure ground, and also forming a zoological garden in connection therewith. The park has now been thrown open, but the other question is still in abeyance. The park occupies one of the finest positions in Stuttgart, and hitherto a fee of fifty pfennigs (half-a-mark) has been charged for admission. It is beautifully furnished with valuable old trees, and adjoins the Botanic Garden, which has also been made over to the public, who may now freely visit it without charge.

**"Dahlia Year Book."**—The *Dahlia Year Book* for 1927 is the best the Society has published for very many years, and we congratulate both the Society and Mr. W. J. Chittenden, the Editor, on contributing such a useful volume to the literature of the Dahlia. The frontispiece is a portrait of Mr. D. B. Crane, the Hon. Treasurer of the National Dahlia Society, and a very keen amateur florist generally; he has been for upwards of thirty years a member of the Floral Committee of the National Chrysanthemum Society. Amongst the many excellent articles are "The Dahlia as a Garden Flower and for Cutting," by Mr. A. E. Townsend; "Some Commercial Aspects of Dahlia Culture," by Mr. Alfred Vasey; "Dahlias in the Kew Herbarium," by Mr. J. Fraser, V.M.H.; "Notes on Dahlia Novelties of Last Season," by Mr. J. B. Riding; "Dahlias as Plants for Tubs," by Mr. Hugh A. Pettigrew; and a series of articles on Dahlias in Public Parks, by Mr. W. H. Johns, Capt. B. H. MacLaren, Mr. F. G. Cousins, Mr. W. W. Pettigrew and Mr. J. T. Jeffrey. There is an excellent portrait of Mr. T. Hay, the Superintendent of Hyde Park, who has done so much to popularise the Dahlia

as a plant for public parks and gardens. Comments on the Dahlia Show of 1926; notes on the Dahlias selected for trial at Wisley in 1926, and the report of the Committee of the National Dahlia Society for 1926 will all be read with interest. We are glad to see that the Society is in a better financial position than for very many years, for on November 10, 1926, there was a balance in hand of £123 15s. 7d., whilst the balance of assets over liabilities amounted to £118 19s. 7d.

**Importation of Potatoes (Canary Islands) Order of 1927.**—In view of the discovery of the Potato Moth in consignments of Potatoes imported this season from the Canary Islands, the Minister of Agriculture and Fisheries has made an Order under the Destructive Insects and Pests Acts 1879 and 1907, prohibiting the landing in England and Wales of any Potatoes grown in the Canary Islands unless they are accompanied by the certificate of health prescribed in the Destructive Insects and Pests Order of 1922. The Order came into operation on May 2, but it allows for the landing of Potatoes shipped from the Canary Islands prior to that date.

**Frauds on German Gardeners.**—In prison at Erfurt, there is a man who last year carried out a colossal swindle by which thousands of gardeners and nursery employees suffered. Under the name of "Thüringer-Pflanzenkulturen," he advertised in about three-hundred newspapers young fruit trees, bulbs, bushes, and most of all, Potatoes, at fabulously low prices, demanding payment in advance, and sacks in which to send the Potatoes. In a few days he had received at his office 10,000 marks in money, and huge piles of sacks! It was only by a fortunate chance that the Police detected the swindle and arrested the rogue.

**Hawsmoor Nature Reserve.**—An estate of about 207 acres, situated some 600 feet above sea-level, near Cheadle, has been acquired for the nation by the National Trust. The estate consists of plantations, moorland, marshes and valleys and, with its wealth of wild flowers, forms a picturesque area in Staffordshire, midway between Cheadle and Oakmoor. It is the resort of several rare birds, and one of the objects of the National Trust in acquiring the estate has been to make it a sanctuary and a place for the preservation of animal life. The birds met with there include the bittern, dipper, water rail and sandpiper. The cost of the property was £1,200, which was raised by public subscription; the management will be invested in the North Staffordshire Field Club, under the auspices of the National Trust.

**A New Order on the Sale of Diseased Plants.**—The new order issued by the Ministry of Agriculture, entitled, "The Sale of Diseased Plants Order of 1927," came into force on April 25, and prohibits the sale or exposure for sale of any plant which bears evidence of having been substantially attacked by the Apple Capsid, or of any trees, shrubs, seeds, tubers, bulbs, layers, cuttings or any other parts of a plant which are substantially attacked by the following pests:—Fruit Tree Cankers, American Gooseberry Mildew, Silver Leaf, Black Currant Mite, Woolly Aphis, all Scale Insects, Brown Tail Moth, Rhododendron Bug, and Powdery or Corky Scab of Potatoes. The reason for the Order is the serious complaints that have been made to the Ministry during the past few months of the increase of the Capsid Bug on Apple trees in certain districts. The need for a drastic Order was strongly urged, and the Ministry, after full consideration of the advice of its Horticultural Advisory Council, decided that the most practicable method of dealing with the matter was to add the pest to the Schedule to the Sale of Diseased Plants Order of 1922. The opportunity was taken of making other small amendments of the regulations, and the new Order is the result.

**German Nursery Employee's Long Service.**—Franz Wieschke, the head gardener in the nursery of Mr. J. C. Schmidt, Erfurt, celebrated, on April 1, the completion of fifty years' service with the firm. It was on April 1, 1877, that he began work as an assistant in the pot-plant department,

where he showed such zeal that he was soon promoted, and as the firm grew in size and importance, his own position steadily improved. He still has the entire confidence of his employers, who celebrated the fifty-years' jubilee by a "festive breakfast," at which several members of the firm were present and congratulated him warmly, also handing to him a message of greeting from the President of the Reich, signed by his own hand.

**The Gardeners' Royal Benevolent Institution.**—The Committee of this Charity is distributing in grants this year from the Victorian Era Fund and the Geo. Monro Memorial Fund sums amounting to £226 to the candidates who were unsuccessful in securing election as pensioners in January last.

**Appointments for the Ensuing Week.**—WEDNESDAY, MAY 18: Royal Gardeners' Orphan Fund meeting. FRIDAY, MAY 20:

four in the morning the approaches to the garden were crowded with some thirty or forty caravans, and till half-past-eight, the hour of closing the gates, the stream of such vehicles continued to flow. A lady, celebrated for her horticultural enthusiasm, sent nineteen caravans full; sixteen horses were required to drag the contributions of another exhibitor, and thus the tents were filled; and not only the exhibition tents, but every other tent in the Garden. Of the plants themselves, our reporter has given ample details. Here glowed a forest of Chinese Azaleas, too brilliant to be steadily looked at; there arose a long bank of Orchids, perfuming the air and delighting the observer with their tender colours and extraordinary forms; one tent was redolent of Roses; another sparkled with the enamelled blossoms of the Cape Heaths; in a third, Australia presented the fairest and gayest children of her golden soil. Many novelties also made their first appearance, conspicuous among which were the Mysore Hexacentris,

FIG. 158.—RHODODENDRON RUSSATUM.

R.H.S. Award of Merit, Rhododendron Show, May 3. Flowers purplish-blue. Shown by Mr. A. N. Williams, Werrington Park, Launceston. (see p. 328).

Manchester and North of England Orchid Society's meeting; Royal Gardeners' Orphan Fund Annual Festival Dinner at the Hotel Victoria. SATURDAY, MAY 21: Wakefield and North of England Tulip Society's show (four days.).

**"Gardeners' Chronicle" Seventy-five Years Ago.**—Exhibits at Chiswick Gardens.—Saturday, May 8, 1852, will long be celebrated in the annals of horticultural exhibitions. Such a mass of noble plants as was then produced at Chiswick no one ever saw before. Accustomed as we have long been to displays of the kind, and especially to those in May, we must own that we were as agreeably surprised as our neighbours. It was known that Mr. Rucker would not show Orchids, and that part of the exhibition was looked to with doubt. He did not show; yet such was the vast display of noble specimens that he was not missed. It was expected that Pelargoniums would be behind-hand, owing to the season, and yet the place assigned to those plants was full to overflowing. At

whose gaudy red and yellow flowers were shown to advantage by a graceful twining habit; Saxe-Gothaea, worthy of its illustrious name, which, together with Fitzroya, is expected to rank among the finest hardy exotic Coniferous trees, and a charming little Azalea, called amoena, just introduced by Mr. Fortune, from China, and said to be as hardy as Rhododendron ferrugineum, which it resembles. The air was warm and the day propitious; but the trees were almost leafless, and the turf and shrubberies were browned by the long, cold, rainless weather, so that the lovers of flower shows might be well excused for deferring their visit till a later day. Nevertheless, the visitors amounted, exclusive of exhibitors, to 2,755, who thoroughly enjoyed the most admirable display of horticultural skill which has ever yet been seen. *Gard. Chron.*, May 15, 1852.

**Publications Received.**—*The Low Road: Hardy Heathers and the Heather Garden*, by D. Fyfe Maxwell; Sweet and Maxwell, 2 and 3, Chancery Lane, W.C.2. Price 6/6 net.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Blotchley Park, Blotchley, Bucks.

**Anguloa.**—The members of this genus are amongst the most tractable of Orchids to cultivate, and when in bloom are of considerable interest. They are now developing young growths and flower buds, which appear together. If repotting is necessary it should be done so soon as possible after the flowers have faded, as the new roots will then be developing from the bases of the young growths. The most desirable species to grow embrace such sorts as *A. Cliftonii*, *A. Clowesii*, *A. Ruckeri*, *A. eburnea*, *A. uniflora* and the hybrid *A. intermedia*. *Anguloas* are strong-rooting plants and require a retentive compost; they succeed in a similar compost to that used for *Lycastes*, and it should be made firm. It is advisable to reduce the old ball of soil as much as possible and to remove all the useless old pseudo-bulbs at potting time. The plants thrive in a shady part of the intermediate house, or at the warmer end of the cool house. Care should be taken that moisture does not accumulate in the young growths, or they may decay at their bases. Red spider may infest the undersides of the leaves during the season of active growth, and if the pest is detected the plants should be dipped in an insecticide.

### THE KITCHEN GARDEN.

By E. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERLEY, Horsley Hall, Gresford, N. Wales.

**Celery.**—Strong, well-hardened plants which have been raised for the earliest supply should now be planted in the trenches. If the soil is dry, soak it with water previous to planting. Lift the roots carefully with a trowel or handfork, and set the plants either in single or double rows. Allow a distance of about one foot between each plant and put them alternately in the double rows. Water the trenches freely so soon as planting is finished, and take care that the plants do not suffer from drought at any time. Keep the foliage lightly dusted with old soot. Should frost or cold winds prevail, a few Pea sticks placed over the trenches will provide the necessary protection. Where spot disease is troublesome spray the plants at an early stage of their development with Bordeaux mixture.

**Runner Beans.**—Seeds of Runner Beans may now be sown in the open. Place the seeds about two inches deep, in double rows, made one foot apart, and allow the same distance between the seeds in the rows. Care should be taken that the young growths are not eaten by slugs, especially when they are appearing above the soil. In gardens where slugs are very troublesome raise surplus plants in boxes to make good deficiencies in the rows.

**Potatoes.**—Complete the planting of late Potatoes. Keep the hoe at work during fine weather amongst the earlier rows or weeds will be troublesome later.

**Leeks.**—The trenches or sites on which Leeks are to be grown should now be well prepared by deep digging and manuring in readiness for setting out the young plants so soon as they are ready for transplanting. Strong, well-hardened seedlings, which are being grown for early exhibitions, may now be planted in well-prepared ground in a sheltered situation. Place the necessary cardboard collars around the plants in good time in order to secure as great a length of blanched stem as possible.

**Radishes.**—During hot, dry weather Radishes should be grown in a cool, semi-sheltered position. Keep the young plants moist and growing actively, or the roots will be tough and stringy.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Asparagus medeoloides.**—Young *Smilax* plants raised from seeds sown early in the year are ready for putting in their permanent quarters. This plant is usually grown on the back wall of a vinery in a special bed made of good turfy loam, leaf-mould, sand and old Mushroom-bed manure. Arrange a wire along the bottom and another at the top of the wall to carry strands of thread or fine string at intervals of nine inches for the trails to climb up. Rain-water should only be used for watering this plant for the foliage will be liable to become discoloured with service water.

**Repotting.**—May is a month when there appears to be no ending to the work of repotting plants grown to produce flowers under glass; everything appears to require attention daily. There are seedling *Begonias*, *Streptocarpuses*, *Gloxinias*, *Browallias* and *Coleus*, to mention only a few, which need this attention, while rooted cuttings of various subjects will need potting singly as they become ready. It is never wise to allow any of these young plants to become starved in small pots before transferring them to larger receptacles. A good stock of loam and leaf-mould should always be kept under cover from heavy rains so that the work of repotting may be proceeded with in all weathers. However pressing this work may be, clean receptacles should always be used, otherwise the next time the plants need repotting, many of the roots will be found adhering to the sides of the pot and get broken in turning them out.

**Bouvardias.**—Cuttings of *Bouvardias* should be placed singly in small receptacles immediately they are sufficiently rooted. Use a good, open compost and continue to grow the plants in a fairly warm temperature. As they advance in growth, pinch out their tops on several occasions to cause them to form bushy specimens. In due course they may be grown under much cooler conditions. Large specimens may be obtained by planting the old stock plants in a cold frame during the summer, and placing them direct in their flowering pots early in September.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Pot Vines.**—Cut backs or other pot vines which are intended for fruiting next year are growing fast and when the roots have become established in the compost they should be fed with warm, diluted liquid manure. The syringe should be used freely when the temperature of the vinery begins to rise in the mornings, and the young rods and foliage should be syringed again after closing the house. Keep the canes trained fifteen inches or eighteen inches from the roof-glass, and pinch all laterals at the first joint from the base; all sub-laterals which develop as the result of stopping the leaders may be removed. Stop the rods when they have made eight or nine feet of growth. As the vines assume a brown colour the amount of ventilation may be increased gradually. If the pots have been placed on pedestals or inverted pots, the fermenting materials placed around them may be gradually drawn away, otherwise the roots will grow through the pots and the vines continue to grow when they should be ripening. The temperature at night may range from 68° to 70°, and in the daytime about 80°, rising to 85° after closing the vinery in the afternoon.

**Strawberries in Pots.**—These plants will now require a large amount of water. When the berries are colouring keep the ventilators wide open, and syringe freely those plants which are swelling their fruits up to the time the latter show signs of ripening, when syringing should be discontinued. As the latest batches of plants approach the flowering stage, the blossoms should be well-thinned before they expand, ten fruits to a plant being ample, those produced by the terminal buds being the finest. Any plants still remaining out-of-doors should be placed in

cold pits or frames; they will not require so much watering as those on shelves in the houses. Let the foliage be close to the glass without actually touching it or impeding the circulation of the warm air above it. Carelessness in watering and syringing often results in attacks of red spider and mildew. The safest and best preventive of these troubles is weekly syringing with clear sulphur water. Make 1lb. of sulphur into a paste, add nine gallons of soft water, stir well, and allow the sulphur to settle at the bottom of the tub before using the specific. If mildew is present the sulphur water may be used at full strength overnight and the plants syringed with clear water early the next morning. If only used as a preventive, dilute each gallon by adding four more gallons of water, and apply it every evening when the plants are not in flower. Green fly spreads rapidly if not checked and soon spoils the fruits. The house should be fumigated carefully up to the flowering stage of the plants. Fire-heat, if ever so mild, is a great help to the plants when they are in flower and swelling their fruits. Maiden plants, put out last August for the special purpose of furnishing runners for forcing, should be carefully mulched and watered. In this case early runners are of more importance than fruit, hence the advisability of removing all flower stems.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Polyanthuses.**—Many gardeners discard *Polyanthuses* when they have done flowering in beds, with the possible exception of some very fine varieties which it may be desired to retain for stock, dividing them for this purpose and planting the portions in the reserve garden. Instead of throwing away the general stock, the plants may be put in semi-wild situations in the garden, also used for under-planting large beds or groups of deciduous shrubs. In suitable conditions they will make large clumps and give a fine display for several years. Another *Primula* which is beautiful under such conditions is *Jewel*, a hybrid of *P. Juliae*. This variety grows and flowers very freely in semi-shade, or in the open; it has been very beautiful recently in partial shade under trees, and has all the appearance of holding its own in thin grass. It is very easily propagated as it divides readily, and a large stock may soon be raised by division after the plants have finished flowering.

**Auriculas.**—When varieties of the alpine section have finished flowering, they should be lifted, divided and replanted in the nursery garden. I refer to plants used for filling beds; the same remarks apply to groups in the rock garden, as all the members of this section benefit by being divided and planted down to the lower leaves to cause them to develop fresh roots from the root-stock. When division takes place it is often necessary to cut away a portion of the old root-stock. All *Primulas* in this section are best divided so soon as they have finished flowering.

**Clematis montana.**—This climber and its coloured variety *rubens* should receive what pruning is necessary after they have finished flowering, as they bloom either on old spurs or on shoots of the previous year. Retain and train in any of the growths that are required for extension.

**Wistaria.**—This climber also requires pruning during the growing season. As the flowers are produced on spurs, all young shoots, except those required for extension, should be cut back and this attention may be necessary several times during the growing season.

**Plants in Tubs and Vases.**—Plants growing in tubs for standing out-of-doors during the summer require a good deal of attention as regards staking and tying. Before they are placed in the open remove a few inches of the surface soil in the tub and top-dress the roots with fresh compost, adding a six-inch potful of bone meal to every bushel of the soil. All plants used for this purpose should be carefully hardened before they are placed in their summer quarters.

Among plants of a shrubby character that are used for this purpose Hydrangeas are first favourites. Large specimen Pelargoniums are commonly grown in tubs and vases, both zonal-leaved and Ivy-leaved varieties, as well as the scented or Cape Pelargoniums, some of the strong-growing species and varieties being very suitable for this purpose. A few of the best are *P. crispum* and its beautiful variegated variety, *P. quercifolium*, *P. Radula*, *P. fragrans* and *P. tomentosum*. *Aloysia citriodora* (Lemon-scented Verbena) also makes a good tub or vase plant. *Datura sanguinea*, *D. suaveolens* and *D. Knightii* are also handsome when grown in tubs as standards. Agaves are specially suitable for furnishing vases or standing in proximity to buildings or in formal surroundings. Apart from plants of a permanent character, there are many others that may be used for furnishing vases during the summer. They include Ivy-leaved Pelargoniums, Fuchsias and Marguerites. *Thunbergia Gibsonii* should be used for draping the edges of vases; in hot, sunny situations it produces its brilliant orange-coloured flowers in great profusion. Such plants may be placed direct in the vases when all danger of frost is past. It is, however, a great advantage if zinc receptacles can be provided that will fit into the vases. The zinc linings may be filled with the plants some months in advance and they will thus be well-grown specimens when they are put out.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Gooseberries.**—These bushes broke strongly into growth early and gave promise of an excellent crop, but the severe frosts have ruined many of the tiny fruits and flowers. If the roots of the bushes were attended to at the time of pruning, and steps taken to destroy the larvae of caterpillars and other pests by removing the surface soil from beneath the bushes, dressing the soil with soot and lime, and applying a top-dressing of good, sweet soil and manure, little further attention will be needed at the present time beyond keeping down weeds.

**Caterpillars.**—Where these pests were troublesome last year, keep a sharp watch for their first appearance, and use measures at once to check them from spreading over the bushes. Caterpillars have been very troublesome in many gardens in late years. Lime or Hellebore powder should be dusted over the bushes and the latter syringed vigorously afterwards with clear water. Katakilla insecticide and other caterpillar washes may also be used in accordance with the directions given by the makers.

**Raspberries.**—Keep down weeds between the rows of Raspberries by the use of the hoe. If the soil has become hard on the surface, loosen it with a fork and apply a mulching of rotted manure over and about the roots. Raspberries have many surface roots and should be fed liberally on light land. Remove young growths springing up between the rows, and also dig up perennial weeds, especially such as Bindweed, which twines around the canes.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF ANNA, Culsean Castle, Maybole, Ayrshire.

**Spraying Wall Fruit Trees.**—Plums and Cherries trained on walls are very liable to become infested with green fly early in the season, with the result that their young foliage becomes curled up, providing a safe retreat for the aphides. At the first sign of attack, or even as a precautionary measure, it is advisable to spray the trees with a reliable insecticide, such as Bentley's Orchard Spray, at the strength recommended for summer use, making sure that the specific is distributed evenly and with force, especially to those shoots which are close under the

copied stones or under glass copings. Black and Red Currants are also very subject to attacks of fly early in the season, and they should also be dealt with before the pests have multiplied much. If the spraying of Black Currant bushes with lime and sulphur wash for the destruction of the mite which causes big bud has been regularly proceeded with during the past six weeks it may now be discontinued, as the mites, if any remain, will now be secure inside the young buds.

**Staking Herbaceous Plants.**—Many plants in the herbaceous borders are growing rapidly and such subjects as Paeonies, Delphiniums and Lupins should be supported in good time either by placing twiggy branches around and among them, or by stakes. The ideal method of staking this class of plants would be to thin

a thin strand of raffia at the proper angle, they may be brought into the desired position by degrees. Young and recently planted vines should be encouraged to make vigorous growth, and the stopping or pinching of these must also be attended to, but as a rule, they may be allowed to extend further before being stopped, as their root action is not yet very extensive. The main leaders should be fastened securely as growth proceeds, and no attempt made to curtail their extension for the next two months, when they will probably have reached the top of the trellis. Heavy syringing should be discontinued, but regular and copious damping down of the borders and gangways on bright days is necessary to secure a moist atmosphere. Close the ventilators early in the afternoons in order that the temperature may be kept fairly high for a long period.

FIG. 159.—CINERARIA FELTHAM BEAUTY.

(see p. 336).

the growths and place one stake to each shoot that is retained, after the manner of supporting specimen Chrysanthemums in pots. In these times of scarce labour speedier methods must be employed, and the branch system seems to answer the purpose admirably, as the plants are not only supported by them, but if the branches are placed in position in good time the foliage of the plants will effectually hide them.

**Stopping and Tying the Shoots of Vines.**—The laterals of established vines are rapidly extending and filling their allotted spaces on the trellis. The growing plants should be pinched at two or three leaves beyond the bunch, and the shoots gently brought into the positions they are eventually to occupy. This drawing down of the shoots is sometimes attempted too early, and the results are fraught with disaster, as the young shoots are very easily snapped off at the heel, but if they are allowed to extend to a reasonable length and secured lightly by

**Fruit Trees in Cool Houses.**—Fruit trees, either in pots or planted out in borders in the cool orchard house, are swelling their fruits, and where the latter have set freely, timely thinning is essential. Trees growing in these conditions should not be overcropped, and it is better to have a few perfect specimens than a big crop of undersized ones. Feeding the trees should be attended to at regular intervals, varying the stimulant from time to time; where a rich top-dressing can be applied it will be of great benefit to the trees. Should the pots be already filled with soil and roots, additional space may be made for this top-dressing by placing bands of zinc or other metal inside the rims. Keep a close watch for insect pests and fumigate the house at intervals, as is found to be necessary, always remembering that insect pests increase with great rapidity at this season of the year. If the trees are growing in pots see that they have plenty of room for the light to reach them on all sides.

## INDOOR PLANTS.

## CINERARIA FELTHAM BEAUTY.

THE plant illustrated in Fig. 159 represents one of a batch of fifty of this variety raised from seeds obtained from Messrs. Sutton and Sons. As my employer, Sir D. E. Nicholls, is fond of Cinerarias, we grow these plants somewhat extensively and rather pride ourselves on the results.

The seeds were sown in a cool frame about the middle of June, in a light, sandy compost, and so soon as the seedlings were large enough they were transferred singly to thumb pots and thence, in due course, to larger pots, taking care that no plant ever became root-bound. We flower our specimens either in twenty-four or sixteen-sized pots.

The compost used for the final potting consists of good, fibrous loam with the addition of a fair proportion of dried cow manure and a sprinkling of wood-ash, soot and old mortar rubble. When the plants are thoroughly established in these large pots they are fed with clear soot-water and liquid cow manure at frequent intervals, and Clay's fertiliser is occasionally used as a variation of diet. *H. Watkins, Fulmer Rise Gardens, Stoke Poges, Bucks.*

## FITTONIAS.

THE Fittonias belong to the Natural Order Acanthaceae and are included among the most beautiful of stove foliage plants, for their delicately veined leaves are decidedly attractive, and the plants themselves splendid subjects for cultivating in pans.

Three species are in general cultivation, i.e., *F. argyroneura*, in which the leaves are green and the veins beautifully traced out in silver; *F. Verschaffeltii* (syn. *F. Pearcei*), which has very dark green leaves, veined and reticulated with red; and *F. gigantea*, a more vigorous grower than either of the preceding, with large leaves, green in colour and veined with pale red. The last species is not so fine as the other two from a decorative point of view. The Fittonias are natives of Peru, and are found wild in shady woods, consequently they should always be shaded from bright sunshine. A moist atmosphere is necessary for their well-being, and a warm temperature in winter essential, although during the summer they will succeed in houses without artificial warmth.

As previously stated, pans are the most suitable receptacles in which to grow Fittonias; they should be well-drained and filled with a light, rich compost, containing a small quantity of peat and sufficient sharp silver sand to render the texture porous.

The present is a suitable time to insert cuttings, choosing the tops of stock plants which are just breaking into growth. Plunge the cuttings in a propagating case provided with bottom heat until they are rooted, and then remove them to a shady position in the plant stove. An abundance of water is required during the growing period, and syringing the plants on hot days with tepid water will be highly beneficial to them. At the approach of winter the supply of water at the roots should be reduced and syringing discontinued. During the resting period keep the soil moderately dry and grow the plants in a stove temperature. *T. H. Everett.*

## IMPATIENS HOLSTII.

THIS East African species of *Impatiens* is an ideal subject for the greenhouse and conservatory. Plants raised from seeds sown on January 13 commenced to flower on April 3; they have been grown in a steady temperature of 60°. They thrive in a compost consisting of two parts turfy loam, one part leaf-mould, and a little sand.

This Balsam is perpetually in bloom, the colour of the flowers being orange-scarlet. Later plants may be easily raised from cuttings; specimens flowering in sixty-sized pots are very useful for many forms of decoration. Diluted liquid manure should be applied to the plants when the receptacles become full of roots. This *Impatiens* makes a good bedding plant, provided a half-shady, sheltered position is selected for it out-of-doors. *C. Ruse.*

## ALPINE GARDEN.

## PRIMULA PUBESCENS.

TWENTY or thirty years ago no good rock garden was thought complete without the inclusion of a good plant or two of the exquisite *Primula pubescens alba*, which was generally known then, and sometimes is still, as *P. nivalis*. It was then much more common and much cheaper than now. Its cultural requirements are fairly simple. It grows about four inches or five inches high and has umbels of white, fragrant flowers. Its general requirements would seem to be a cool corner in the rock garden and a good loam; in the north it should be exposed to a little more sun. It is increased by division, and to maintain a stock it is desirable to divide the plants every two or three years.

## PHUOPSIS STYLOSA.

THE Crosswort is one of the most easily-grown rock plants. The species is of somewhat trailing habit and grows only a few inches high. It has very narrow leaves in whorls, and wonderfully large heads, composed of a number of flowers of a bright pink, with conspicuous, projecting stamens which give the heads of flowers a light and elegant appearance. There are two or three varieties, differing in the brightness of their flowers. The one named Brilliant is of a deep pink or rose and creates a good effect in the rock garden. One defect of the Crosswort is the strong odour which the plant emits in the evening or after rain; the smell has been likened to that of the fox. The plant grows well in ordinary loam, but I consider that it is neater when cultivated in a poor, sandy soil, where it flowers equally as well as in a richer compost and does not spread so rapidly. Those who do not object to its odour and desire a long-flowering plant for a rough part of the rock garden in sun may select *Phuopsis* (syn. *Crucianella*) *stylosa* Brilliant. *S. Arnott.*

## HUTCHINSIA ALPINA.

*HUTCHINSIA alpina* is a desirable plant for the rock garden. To be seen at its best it should be planted in fair sized patches, and it quickly becomes established if planted in a suitable position. The plant is exceptionally free-flowering and appears as a sheet of snow-white bloom during April, May and June, and it is seldom out flower through the summer. It attains a height of from four inches to six inches and bears cruciform flowers in clusters at the termination of short flower stalks.

As a carpet plant for such spring flowering bulbs as *Chionodoxas*, or the dwarf *Narcissi* it is an ideal subject.

Propagation is most easily effected by inserting small tufts in sandy soil in a cold frame. *T. H. Everett.*

## FLOWER GARDEN.

## ORECOME CANDOLLEI.

THIS is a fine foliage plant, probably more suited to the wild garden than the herbaceous border, although in extensive borders it is a useful subject for the background. This giant Umbellifer gives a fine effect to a clump of tall Delphiniums with its large, yet delicately cut leaves.

It is an accommodating plant and thrives well even in a sunless border and needs no staking. It is also perfectly hardy, nor does it tend to get out of hand by suckers or multitudinous seedlings, as is sometimes the case with similar subjects.

It is of particular value for associating with hardy Ferns, Funkias, etc., and seems to escape insect attacks and disease entirely.

## PHLOX DECUSSATA VAR. COMTESSE DE JARNAC.

THIS is a very striking plant with richly variegated leaves and is always attractive, either when used in the herbaceous border or in a bed in conjunction with other subjects, such as *Kochia trichophylla* or *Perilla nan-kinensis*.

Its flowers are, perhaps, a little uninteresting, being white with a reddish-pink eye, but it is not too much to hope that some day we may have a variegated form with more showy blossoms.

However, the existing variety is a fine, sturdy grower of average height and shows no marked preference for soil or situation. It is as easily increased as the ordinary varieties of *Phlox decussata*.

## HYDRANGEA PANICULATA GRANDIFLORA.

THIS well-known *Hydrangea* is seen to the best advantage when planted in a bed by itself, when, with correct pruning and a liberal mulching around the roots so soon as the young growths are well started, it will form a feature that will command admiration from the end of July to the middle of September.

To obtain the best results, the plant should be cut back to within two or three buds on the old wood in spring, and the young shoots disbudbed so that only a reasonable number is allowed to remain on each plant. During the summer, frequent applications of liquid manure will be very beneficial to growth.

Treated in this manner, shoots four feet to six feet long will be made each season, and these will be terminated by panicles of white flowers two feet or more in length. So soon as the flower heads appear it is advisable to support each with a thin stick, otherwise they are liable to be broken by winds and rains. *T. H. Everett.*

## FLORISTS' FLOWERS.

## THE DAHLIA.

IN the *Year Book* of the National Dahlia Society, recently published (an interesting effort, by-the-way), a contributor of one of the articles suggests that numbers of varieties once esteemed might well be scrapped to make room for more of the accepted modern ones. An important grower also, in a recent letter to the trade journals, desires combination on the part of specialists for a similar purpose. This is an indication that many sorts in cultivation are not wanted.

Those who grow Dahlia plants for sale have the matter in their own hands, and if all were of the same opinion as the writer, one would not wait for the other, but make a start this year by simply dropping any variety not conforming to modern ideas. It may be there are still admirers of the old exhibition Dahlias, and the formal show type of the Cactus section, the more so, probably, in the midlands and the north; still, these forms are dwindling, as such, and appear to be left out by those who are in the habit of cultivating the newer varieties.

There is but one standard to-day, i.e., adaptability to garden display. If then, it be desirable to destroy once esteemed varieties, it may also be as well to drop superfluous distinctions in descriptions. Why Show and Fancy, Cactus, Paeony, Miniature-Paeony, Star, Camellia-flowered? Short, tall-growing, double, single, large, small-flowered, are simple terms that cover the whole series of Dahlia, and might very well be used without further sectional descriptions.

In the culture of Dahlias, again, the methods of the old florists are taboo; we may neither thin the growths nor concentrate upon a few blooms to each plant. At Wisley, for example, where the new sorts are on trial, cultivation means just trenching the ground, putting a stake to each plant, and affording sufficient ties to prevent it from topping over; and I believe last year water was not applied, other than what came from the clouds. I think no Dahlia can be considered as grown at its best without judicious thinning, and with very few exceptions, a better mass of bloom is obtained when soft, unripened and unwanted laterals are removed at flowering time. Many handsome Dahlias have failed at the official trials because this small attention has been omitted. Mr. H. C. Dresselhuys is a variety bearing exceedingly pretty, light pink flowers; is excellent as a plant, too, but is spoiled, to my liking, if allowed to grow and bloom at will. So is

**Do you wash  
your face?**

Of course you do, if you desire to be healthy. Then **WHY** expect to keep your Fruit, Flowers and Vegetables free from disease without making efforts to cleanse them?

In their case the need is the more urgent because of the multitude of voracious insects that infest them,

and of the amazing rapidity with which they multiply, if unchecked.

The wise Gardener takes time by the forelock and attacks the pests with an efficient spray before they begin to multiply. He further shows his wisdom by selecting an insecticide of established reputation of which

# KATAKILLA

Stands in the front rank for all-round efficiency,

Katakilla is a **Non-poisonous** and **Inexpensive** insecticide, in powder form ready for mixing with water.

## SANDERS Royal Orchid Nurseries ST. ALBANS

We have available, from recent importations, very splendid plants of the following:

Vanda coerulea  
„ Amesiana  
„ Kimballiana  
Dendrobium infundibulum  
„ Findleyanum  
„ Wardianum giganteum  
Lycaste Skinneri  
Odontoglossum grande  
Oncidium Rogersii  
„ ampliatum majus

We shall be pleased to quote and cordially invite inspection.

Secretary Voors, similarly pretty in salmon-pink and gold, and like the first-named, has medium-sized blossoms.

Possibly the huge-flowered sorts suffer the most when growths are not thinned; anyway such sorts as Berengaria, Sheila Ward and Jersey's Beauty are unlike their best selves when cultivated in the fashionable natural manner. Mabel Lawrence, one of the biggest blooms seen at exhibitions, is comparatively poor at the trial; and so I could go on mentioning varieties, the beauty of which is enhanced by timely thinning.

Among dwarf, bedding Dahlias the distinct and popular Coltness Gem seems to defy improvement. Hundreds of seedlings from it fail in some respect as compared with the original. Perhaps Lady Aileen, rose, with carmine ring, is the best to date, although H. J. Jones goes some way towards being a fine, dwarf yellow. Capital grouping varieties are Pink Pearl and Crimson Flag; and the single-flowered Lemur is certainly one of the more distinct, as the almost black foliage affords a rare setting to the bloom; in fact, a group of this variety is something at once choice and pleasing in Dahlias.

Somewhat new sorts which arrest attention are John Mensing, crimson-scarlet; Menny Carlee, white, and Macdonald, orange-scarlet, the blooms being of medium size in each case. Larger flowers are borne by Uncle Dick, distinct in scarlet and white; Acme, with shaggy flowers of carmine and yellow, quite pretty; Cintra, pale yellow, is what may be termed a small-flowered kind; as is Diophen, in crimson-scarlet. I like another of this type named Rose Elegance, an improvement on that remarkable old favourite Delice. This is quite one of the more attractive of recent varieties. Rapallo, Clown, W. D. Cartwright, Rose Tendre, Royal Purple, Thomas Hay and Locarno, are just a few among the many new forms noticed this last year, and which will be included in the trials and may be seen growing there in due course.

The present type of Dahlia esteemed for the garden may be but a passing phase, but the good flower-stem is essential; we do, however, need something more distinguished in the way of the individual blooms, and this should come with time. The great army of cultivators referred to as amateurs—the backbone of the cult—require more than a plant which is effective. To sustain their enthusiasm in flower-growing for any length of time there must be a subject requiring care in regard to the details of watching, watering, shading and thinning to obtain size and shape and form out of the common. My contention is that popular types to-day do not possess those necessary good qualities combined with elegance as did some of the varieties now under a cloud; but having once got the approved stem, raisers should see to it that other important qualities follow.

There are those who have an idea that the Dahlia will become as useful for cut-flowers as the Chrysanthemum. It may, but not until varieties are evolved which will last better in water. There is a likelihood of the tiny Pompon proving most useful for this purpose. It is strange, indeed, that these forms have been so poorly exploited hitherto. I daresay the writer has noted as many changes in connection with the Dahlia as most folk, from the time of Turner and Keynes; but who, even a score of years ago, would have thought of the eclipse of the old exhibition sorts? H. S.

## FRUITING OF MUSA BASJOO IN FRANCE.

THE fruiting, in the open air, in the Paris district, of the Japanese Banana (*Musa Basjoo*, Sieb. and Zucc., or *Musa japonica*, Hort.) has been reported on several different occasions; for instance, at Verrières in 1906 (see *Revue Horticole*, 1907, p. 58), and at Melun, with M. Debreuil, in 1911. The phenomenon occurred at Verrières again, in the collections of Madame Philippe de Vilmorin, in August last year, and the photograph (see Fig. 160) shows that

part of the inflorescence of which the development was not arrested by frost.

This inflorescence, recurved, with numerous brownish bracts which fall as elongation proceeds, was at that time sixty centimetres in length, and bore a number of small fruits seven or eight centimetres long—little miniature Bananas. Up to the present, the production of seeds in *Musa Basjoo* does not appear to have been recorded in France. We have tried unsuccessfully to fertilise artificially, although the pollen grains were perfectly formed (germinating well in a five per cent. solution of sugar) and only giving about ten per cent. of abortive grains.

France were much better. Immediately on the introduction of the species, the Messrs. Veitch sent plants to Thibault et Keteleer, the clever horticulturists of Sceaux, near Paris, and in 1889 it was put into commerce in France by Sallier, who succeeded Thibault et Keteleer. (See *Revue Horticole*, 1896, p. 202).

The Japanese Banana requires a situation protected from high winds which would damage the leaves, a rich soil, frequent watering during the summer, and, from time to time, applications of liquid manure. On the appearance of the first autumn frosts, the leaves are cut away close to the stems, the whole plant is wrapped in a covering of very dry leaves, and

FIG. 160.—MUSA BASJOO FRUITING AT VERRIERES.

The Japanese *Musa* is found wild to the North of Japan (Island of Yezo, Hakodate). The region is said to be one of extremes of temperature, varying from 32°C. below zero, in winter, to more than 42°C. in summer; in winter there are sixty centimetres of snow, and the plant pushes up in the spring, putting forth suckers abundantly. The Japanese *Musa* was introduced into England about 1885 by Messrs. James Veitch and Sons, of Chelsea, plants having been received from their traveller, Mr. Charles Maries. The species was figured in the *Bot. Mag.* in 1891 (tab. 7,182) from a specimen which flowered and fruited in the Temperate House at Kew. Grown in the open air in England the plant does not seem to have succeeded well, probably because the summer temperature is too low the results obtained in

on the outside a hood of straw forms a protection from rain. As a matter of fact, it is the damp of the winter which is more to be feared than the cold.

According to the vigour of the stems, the leaves may attain to a size of two metres sixty centimetres wide; the suckers which develop each year form stems of varying shapes, and make up a very pretty picture, quite tropical in appearance, and not what one would expect in a temperate climate. Naturally, in the South of France the Banana grows to a larger size. Sahut formerly described some plants growing at Montpellier which were more than six metres in height, and the leaves of which were three metres in length. The species is cultivated in the South of Japan for its fibre, from which a coarse kind of cloth is manufactured. A. M.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand 1 or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, if artistic, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## A PLANT COLLECTOR IN DEVON.

THERE is not a great deal, even in "Glorious Devon" in flower by Easter, and the spring of 1927 has been a long-drawn one. Nevertheless, the deep Devon lanes, or the sunny, rock-bound south coast, in the middle of April, were memorable, if not for variety, at least for profusion of wild flowers.

It occurred to me recently to indulge a fancy, and viewing our wild flowers with as complete detachment as possible, to imagine myself collecting garden plants in a strange country, and, therefore, selecting only those which promised to give good garden value in a somewhat similar climate overseas. Which, if any, plants would I select, and why?

It is not easy to view entirely without prejudice flowers with which one has been familiar since childhood; but with regard to my first choice there could be no two opinions. The Primrose is, in fact, a garden plant, and it may be questioned whether any of the "improved" strains are really an improvement on the wild plant. The collector, finding the first Primrose would certainly sing its praises and report that he had found a first-class plant, but its abundance, in woods and on banks, would convince him of its adaptability and constitution, and incidentally relieve him of the necessity of marking plants.

Both the Dog Violet and Greater Stitchwort (*Stellaria Holostea*) would glorify any rock garden, the form and colour of the first, and the fairy elegance of the second at once attracting attention. The Violet is, of course, a popular plant, and we are only contemptuous of the second because of its familiarity. *Gypsophila* has usurped its place. I think, too, that the common blue Speedwell (*Veronica Buxbaumii*) would be judged an annual of great promise, on account of its rich blue colour, though its small size, and what may be called lack of flower power, are against it. The collector might also remark its evanescence, but it has undoubted potentialities. Passing over the common purple Deadnettle, a white *Allium*, *Stitchwort*, and *Lesser Celandine*, a collector would find on the cliffs compact tufts of *Thrift*, the stiff pile of the glaucous leaves just becoming studded with purplish pink buttons, and would vote it first-class on sight. On the short turf he would see also a tiny flowered *Forget-me-not*, but if the genus was unknown to him, he would hardly conjure up from it, by the aid of selection, the blue vision of our garden plants; the common *Hedge Arum* also he would pass by, unless he happened to see it in scarlet fruit. A batch of poor flowers are: *Herb Robert* (*Geranium Robertianum*),

which, though vivid enough to be seen, would anyway be damned for its strong and rather unpleasant smell; the insignificant *Ground Ivy* (*Nepeta*), wild *Strawberry*, and pink *Catchfly*, which is not colourful enough.

Although the individual *Bluebell* would hardly be received with acclamation by the discriminating collector, yet if he came upon mass production in a wood for the first time he would shout for joy. Therein lies one of the difficulties of judging plants; circumstances and surroundings may enormously enhance the value of the individual plant. Perhaps the feeblest way out of the dilemma is to collect everything.

Few sights, even in England, are more lovely than when the sunshine filters through the first film of green foliage on to a blue carpet spread beneath. The *Bluebell* of England is, of course, a *Hyacinth*, or *Squill*; the Scottish *Bluebell* is a *Campanula*, which we call *Harebell*, and perhaps its graceful, drooping head of flowers is more pleasing than the drill-sergeant stiffness of the *Hyacinths* we grow in pots, though it lacks the fragrance which is such an attraction in the latter. Other flowers there are—weeds, we call them—which, being cosmopolitan, the collector must have seen before, and I need say no more about them.

FIG. 161.—VINEYARD AT GROOT DRAKENSTEIN.

Confining myself strictly to plants actually in flower, there are several shrubs which the rawest collector could not pass by. Firstly, *Butchers' Broom* (*Ruscus aculeatus*). Its starry flowers are almost too faint to be seen with the naked eye, and few to boot; but its queer appearance would interest a collector, who then, if he knew his job, would be eager to explain its curious morphology. "Flowers growing out of leaves?" he might ask. "Impossible! something wrong here." And after examining it, and solving the riddle of leaves and phyllodes, he might become almost endeared to its rather banal, but worthy qualities. It is not exactly a first-class garden plant, but it is attractive. Secondly, *Blackthorn*. Surely, a stranger would be hypnotised by that snowdrift illuminating the diffuse twiginess of the dark hedge, where neither leaf nor flower showed else. Its graciousness is short-lived, but it does fill a gap while it lasts. Thirdly, *Wild Cherry*. To anyone who had never seen a *Cherry* tree before, that would be a revelation; it is almost the only tree in flower in the woods, and is equally beautiful in the open.

I have left the best till the last. It is very difficult for anyone who has spent his boyhood amidst *Gorse*, to be quite sane about it. One is in danger of saying either far too much, or nothing at all; but to some of us neither *Heather* in Scotland nor *Rhododendrons* in Tibet have burnt their colours quite so deeply

into the memory as have those flaming leagues of English *Gorse*. Perhaps, if one had to choose a single shrub out of all the known subjects, to plant in a garden, one would choose *Gorse*. Its glowing, chrome colour, its reckless generosity of blossom, the definite shape of its individual flowers merged by their profusion into a trim cloudiness, endear it to everyone, though so common is it that we rarely stop to consider what an astonishing object it is. No wonder the Swedish botanist, *Linnaeus*, stood spell-bound before it!

A few other flowers may be recorded; the blatant *Dandelion*, and the inept *Nasturtium*, or perhaps *Cardamine*, any or all of which would be ignored; likewise the lowly, rather raw-coloured *Pedicularis sylvatica*, if only by reason of its greedy manners. The purple *Orchis* would appeal rather to the botanist, while, caught in two minds about the Ivy-leaved *Toadflax* (*Linaria Cymbalaria*) the collector might be inclined to risk his reputation and collect it; he certainly would the fine blue *Anchusa sempervirens*.

But what world collector can claim that of the first thirty plants be found out in the spring of the year, half were garden treasures? F. K. W.

## FRUIT GROWING IN THE WESTERN CAPE PROVINCE.

No fruit which reaches this country is more welcome than that which comes from the Cape soon after Christmas, and carries us through the Peaches, Nectarines, and Plums up to the late Pears, which finish the season in April or May.

The enterprise is due to the energy and imagination mainly of three men, Mr. L. E. Dicey, the pioneer grower in the Hex River Valley; Cecil Rhodes, who saw that the phylloxera-ridden Grapes might be replaced by Peaches and other fruit; and Mr. H. E. V. Pickstone, the well-known nurseryman, whose introduction of new fruits suitable for the country has crowned the work of the pioneers. After production, came problems of distribution, and the work of Griffiths and his collaborators has now made the cold storage at Cape Town one of the best in the world.

Most of the deciduous fruits grown for export is produced within a hundred miles of the Cape, and it is with this branch that I am concerned at present. Citrus growing, which promises to be of great importance in the future, is generally farther up country, and I regret that the time at my disposal did not allow me to see this. The climate and rainfall within a hundred miles of the Cape are surprisingly varied,

and the elevation, too, is of great importance in its effect upon the different fruits grown.

In dry areas irrigation is, of course, necessary,

wines, and also the Semillon, Verdot and Sauvignon.

Generally, however, we find that growers choose the Grapes for quantity rather than

the rather rough hot wines of southern France and northern Italy, rather harsh and not keeping long enough to allow the more fiery particles to tone down with age. It is noteworthy that the world's best wines are nearly all grown somewhere near the northern limit of culture. The main centres of Grape-growing I visited were in the Drakenstein Valley (see Fig. 161), around Wellington, Stellenbosch and Worcester. The American stocks are used as resisting phylloxera, but there seems room for still further experimentation in this direction.

#### PEACHES AND NECTARINES.

The Peach crop is now of great importance, and this fruit revels in the hot sun and seems able to exist on a very small allowance of water. The growth of the trees is amazing to European eyes; I saw a one-year-old tree of Peregrine planted in September, which had in February reached eight feet in height and six feet in diameter, incredible dimensions to any one who had not actually seen it. Many of our English varieties hold a prominent place, and to the credit of Messrs. Rivers stand Peregrine in the first place, Duke of York and Early Rivers.

Native varieties of recent origin showing much promise are Schoongezicht, which was selected by the late Mr. Merriman from an old Cape variety; and a sport of Early Alexander, which is said to be a fortnight earlier than its parent. The Crimson Galande, Pucelle d'Orleans and Early Crawford are also grown, and Muir, a yellow-fleshed variety used for canning is found in large quantities.

Nectarines are also grown, Spenser, Stanwick, Newton, and Dryden being preferred, while Victoria is not thought more of in South Africa than at home.

#### PLUMS AND APRICOTS.

Next in importance come the Plums, usually known in England as Cape Plums, but which, as is well-known, are really Chinese and Japanese in origin, being descended from *Prunus salicifolia*, and not from *P. domestica*, as are our European varieties.

Kelsey is the most widely grown; this sort is well-known on the English markets and finds a

FIG. 162.—APRICOT ORCHARD AT GROOT DRAKENSTEIN.

but in the areas nearer the Cape, rainfall is sufficient without this. The temperature in the lower valleys is high in summer and autumn; at the time of my visit in March it reached 101° in the shade on one day, and it will be remembered that in such temperatures delicate fruits like Peaches and Plums are gathered and packed.

#### GRAPES.

One of the oldest wine-growing districts is Constantia, near Cape Town, just behind Table Mountain, Constantia wine being well-known in former days. Here, nowadays, are grown many of the table Grapes for the English market. As one stands on the higher ground and looks down on hundreds of acres of these Grapes, all trained on wires about three feet from the ground, it is with a shock that one learns that these hundreds of thousands of bunches are all thinned by hand as in our glasshouses at home! The Cape coloured people who do all the horticultural work have learned to do it well, and, indeed, all the packing, grading, pruning, etc., is done by them, white labour being only used for supervision.

The varieties grown are in most cases familiar to European gardeners—Barbarossa, Waltham Cross, Black Monukka, Muscat of Alexandria, Almeria (Ohanez), Gros Maroc, Madresfield Court, Lady Downes, Muscat Hamburg and Gros Colmar, are all found in varying quantities. The most popular, however, are the Red Hannepoot and White Hannepoot, commonly known as "Honeypots." The white variety is very similar to Muscat of Alexandria, but it seemed distinct to me, the berry being rounder and the leaf less deeply cut. The Red variety is also of Muscat flavour and travels well. These two varieties are probably of European or Asiatic origin having been brought out by early Dutch or Huguenot settlers.

Many varieties, new to this country, are on trial, and the most striking of these is Flaming Tokay, an enormous bunch of almost brick-red berries, a colour I have never seen before. Reine Olga (Chasselas Rose) is near to it, but duller and more rosy than this striking variety. We shall probably soon see this Grape on our markets in quantity as Cape growers are much impressed with its saleable appearance. As is well-known, a large acreage is devoted to wine Grapes, and a few of the standard European varieties are found, such as the Reisling, the "informing Grape" of the Hock

for quality, and this is probably one of the reasons that the Cape wines are not yet up to French standards of excellence. I did not see any of the Cabernet or Pinot Grapes, which are the mainspring of the excellencies of the Clarets and Burgundies of France. In place of these a variety called Green Grape, like our Sweetwater, and the Hermitage (not the Hermitage of Europe, which is a white Grape), are mainly grown and they are good croppers.

FIG. 163.—PEAR PLANTATION AT MR. DICEY'S FARM, HEX RIVER VALLEY.

Probably the main cause of the failure of Cape wine to reach highest standards is that the sun-heat is too great; the fruit ripens too rapidly and develops too much sugar, and the fermentation, not done in cellars as in many European vineyards, is too rapid in such high temperatures. The wine resembles, therefore,

sale because none better is available at the time. I had hoped that by tasting a Kelsey really ripened on the tree (when it is a dull red) I might be converted to this group of fruits. Alas! it was not so, none of them is more than second-rate; the best I tasted, Gaviota, equalled a Victoria, but nothing

approaches our best Gages; rather one fruit of the Transparent Gage than a bushel of Kelsey's! The Apple Plum, another of this group, was over at my visit, but I was told it was the best of all.

A few English varieties are grown, such as Black Diamond, Pond's Seedling, "Pride of England," very like President, but it is generally said that the Gages will not do well. As, however, the usual stock for Plums is the seedling Peach, one wonders if this is not the fault, or, perhaps, pollination?

Apricots are largely grown for drying, and the variety named Royal in California is the mainstay of most growers. The "Cape" Apricot, an old, rather stringy sort, is still found, while Blenheim and Moorpark are grown in decreasing numbers. A few Apricots are sent to England as table fruit, but they are not satisfactory; I imagine the trees are overcropped as I am told that the fruit does not swell out properly.

The most remarkable feature of Apricot-growing is the small amount of water the trees will exist upon. White, dry sands, which even with our rainfall we should deem hopeless, produce large crops of fruit suitable for drying, and some four to five bushels per tree are often produced on bushes planted about twenty feet apart (see Fig. 162). The trees suffer from "die back" as at home, showing that it is not our colder climate which causes this serious trouble.

#### PEARS.

The principal varieties of Pears grown are Williams's Bon Chrétien, Beurré Bosc, Glou Morceau, Winter Nelis, Clapp's Favourite, Josephine de Malines, Keiffer and Doyenné du Comice. One also sees in small quantities Beurré Diel, Beurré Superfin (this sort is reported to be a poor cropper), Flemish Beauty, Lawson and Durondeau. Whether grown on irrigated land or in districts where the rainfall is sufficient it is a custom to plant about twenty feet to thirty feet apart, and the trees make handsome bushes. The quality of the fruit is not quite up to our best, but Williams' is quite good, and some of the later varieties, such as Winter Nelis, often excellent. There is, however, a great need for some method of determining the right time to pick Pears, as it often happens that of a dozen purchased in this country half will never come to maturity, and remain hard and uneatable. It was interesting to hear that even on irrigated farms the trouble of autumnal blossoming not infrequently follows late summer irrigation, as it often does in this country after heavy autumn rains. Edward A. Bunyard.

(To be concluded.)

## THE CONTROL OF SOIL ACIDITY BY ALUMINIUM SULPHATE.

THERE are many of us who, although cursed by the presence of lime in the soils of our gardens, would fain grow Rhododendrons, Heaths and other Ericaceous plants, not to mention certain Lilliums and other bulbs and shrubs which are definitely calcifuge.

It is, perhaps, unnecessary to mention here how often failure follows attempts to create peat pockets and beds for plants such as the above—all goes well for a year or so, and then the plants begin to sicken, cease to flower, and either drag on a miserable existence or die.

If the soil is examined a year or two after the making of such beds, it will be found to contain lime and to be alkaline in reaction—this condition is, in my opinion, brought about by two factors: first, the use of hard, lime-laden water; and secondly, by the action of worms which carry in the native lime-containing soil from the bottom and sides of the beds. It is, of course, possible to make the beds on the principle of a concrete box, with a drainage of a thick layer of well-rammed ashes and clinkers, but even this does not remove the necessary occasional use of tap water, which, by itself, will make the soil unsuitable for Ericaceous plants.

As a matter of fact, the happiness of such plants really depends on the reaction, i.e., acidity of the soil rather than on the presence or absence of lime; certain forms of lime, e.g., hard Yorkshire and Purbeck limestone are almost innocuous, being only very slightly soluble in water, whereas chalk and mortar are most decidedly inimical to the plants under consideration.

The acidity or alkalinity of a soil has a very marked effect on the decomposition of its constituents; pure peat consists of a mixture of generations of leaves and fine rootlets, and does not lose its appearance and composition for many years; its reaction, moreover, is acid. Garden vegetable refuse, leaves and manure, are alkaline in reaction and, as is well-known, quickly decay—they are not good additions to soil intended for Ericaceous plants, but Beech and Oak leaves, if lime-free, are an exception to the rule, as they decompose slowly and are of an acid reaction.

It had often entered my mind to try the effect of very weak hydrochloric acid on soils containing a small amount of lime in order (1) to render it acid; and (2) to convert the lime into the very soluble calcium chloride which would be washed down or leached away by subsequent waterings with rain-water. I was never quite brave enough to try the experiment which, incidentally, would have required a good deal of care and more watching and note-taking than I have time for.

A few weeks ago my attention was drawn to some extraordinarily interesting work done by Mr. Fred Colville, and reported in *Bulletin I* of the American Horticultural Society, which is my excuse for these notes and from which I have culled the following statements of experiments made on Ericaceous plants. Mr. Colville had heard that magnesium sulphate (Epsom salts) had a beneficial effect in rendering alkaline soil acid; he consulted a friend who was a horticultural chemist and the latter said he thought that aluminium sulphate would produce the same effect and do it better.

**EXPERIMENT No. 1.**—Eighteen seedling plants of *Rhododendron catawbiense* were placed in small pots in a compost of sand, decomposed cow manure and soil containing lime. Six of these plants were merely watered with rain water; six were given weak doses of magnesium sulphate; and the remaining six were treated with aluminium sulphate. After three months the untreated plants were stationary, those treated with magnesium sulphate had grown fifty per cent, and those treated with aluminium sulphate had grown 250 per cent. Sixteen months later the untreated plants were all dead; those which had received magnesium sulphate were stationary; and those treated with aluminium sulphate were many times their original size, and in every respect equal to plants grown in peat.

**EXPERIMENT No. 2.**—Eight established plants were potted up in ordinary garden soil in two-inch pots and received ordinary care for one year; they had stagnated and looked sickly the whole time. Four of these plants were each given half-a-gram of aluminium sulphate; after seven weeks they had made slight growth, while the four untreated plants were stationary. A week later the treated plants were each given another half-gram of the sulphate. Eleven weeks after the experiment commenced the treated plants had grown 65 per cent., and looked green and healthy; the untreated plants had assumed a very sickly, brownish colour. Aluminium sulphate given to peat-grown plants produces no effect; it cannot, therefore, be said to have acted as a fertiliser in the above experiments.

Most of Mr. Colville's experiments, and results, are illustrated by photographs which add great value to the text.

When using a solution of aluminium sulphate for the purpose of acidifying the soil, the early "leachings" or filtrates from the pots contain very little aluminium, but much calcium sulphate; the water is, moreover, alkaline at first, but becomes acid as the treatment progresses. For those who are unversed in chemistry it should be explained that the aluminium sulphate combines with the lime (calcium carbonate), forming aluminium carbonate and

calcium sulphate, which latter is "leached" away during the subsequent waterings, so long as soft water is used. It is also claimed that the acidity thus produced is permanent—provided always that the plants are not watered with a hard, lime-containing water, but even so, the damage done may be rectified by an occasional watering with aluminium sulphate.

It is suggested that large, established plants should be top-dressed with half-a-pound of aluminium sulphate per square yard, and a warning is given that this treatment in a mixed border would not agree with lime-loving plants. I presume, however, that no one would be so optimistic as to try growing both sets of plants in the same bed.

The reaction of a soil is easily tested with a solution of bromethyl blue. The drainings from a pot—or a sample of the soil—may be shaken up with soft water; the water is poured into a white dish, and a drop of bromethyl blue is added. If the blue colour persists, the soil is alkaline, presumably containing lime; if the drop becomes green, the soil is neutral in reaction; while a change of the solution to yellow denotes acidity—the condition we are working for.

There is now before us an opportunity of thoroughly testing the efficiency of aluminium sulphate, and there are few gardens which do not possess at least a few pot-grown plants of *Azalea indica*, *amoena*, etc.—even in the best-managed establishments I have noticed that many of these plants, although they flower well, look sickly and are suffering from "chlorosis."

If these notes are the means of saving the lives of a few of the thousands of pot-grown *Azaleas* and *Ericas* which are annually killed through the agency of hard water, they will, I venture to think, have served their purpose, but I have hopes that the use of aluminium sulphate will enable us to do a good deal more than this, and to succeed where we have previously failed with plants in prepared beds. Maurice Amsler, M.B., Eton.

## TULIPS IN HYDE PARK.

A LARGE, serpentine border near the Victoria Gate, Hyde Park, is planted with some 40,000 Tulips in about 150 varieties, and those who have the opportunity to visit this famous London Park before the flowers are over will be amply rewarded by the grand spectacle of this enormous number of Tulips in bloom. The Tulips are growing in the forefront of a small shrubby border and show to great advantage against the beautiful spring foliage of the shrubs. The majority of the varieties are now in their full beauty, but several sorts are still in the bud stage, whilst some of the earliest are just getting over.

The Tulips consist mainly of Rembrandt, Cottage, Darwin and Breeder varieties, the great majority being of the Darwin section. The Rembrandt Tulips are Darwins which have broken into a variegated flower, and of these much the finest is Flamboyante, with flowers feathered with violet-purple and maroon on a white ground. In stature and vigour generally this sort exceeds all the others of its type, of which the next best are Van der Heede, scarlet and white, and Pierette, mauve and crimson on white. There are a few of the section known as Lily-flowered Tulips, so-called from the shape of their flowers; this is a very early-flowering section, of which Adonis, Sirene and the very dwarf Artemis are examples. The border also contains examples of Gesneriana Tulips, such as Gesneriana spathulata, a beautiful orange-scarlet colour and G. ixioides, a rich yellow variety. We also noticed several very fine Cottage Tulips, of which Boston is one of the finest in the collection. This variety has been flowering for a very long time, for it is one of the early sorts, and produces big goblets of pale salmon-pink edged with yellow. It is one of the most robust of all and has exceptionally stout stems. Astoria is another big goblet-shaped flower with stout stems, but it is a little dwarfer than the last and from

## THE WORLD'S FINEST DAHLIAS FOR BEDDING

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.——No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about 1½ feet in height.

### JANET

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Rich deep apricot, with a suffusion of deep orange—a glorious colour; the individual flowers are not quite so large as those of 'Coltness Gem,' and it is of rather more dwarf habit. In freedom of bloom, upright stems carrying the flowers clear of the foliage, and general characteristics, it is a counterpart, a fine companion, to 'Coltness.'

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

**DWARF BEDDING DAHLIAS**

We have a very large stock of plants in fine condition.

**COLTNESS GEM** The most popular bedding Dahlia. Its brilliant scarlet flowers are produced in the greatest profusion during summer and autumn till frost comes. Habit dwarf and compact. Height 18 inches. Plants from pots 12 for 7/-, 25 for 13/-, 50 for 25/-, 100 for 47/6. Carriage paid for cash with order.

**PAISLEY GEM** A new variety of the greatest merit. Flowers brilliant orange-scarlet with a double row of ray florets. It is quite as dwarf and compact in habit, and is even more floriferous than Coltness Gem. A decided acquisition which should be in every garden. Plants from pots 12 for 13/-, 25 for 25/-. Carr. paid for cash with order.

*Catalogue of Hardy Scotch Grown Bedding plants may be had post free on application.*  
**AUSTIN & McASLAN**  
**91-95, Mitchell Street, Glasgow**

its several qualities, including earliness, it should be valuable for spring bedding. The colour is pink shot with purple on a white ground.

The favourite Bouton d'Or is giving a good account of itself amongst so many others. It is a lovely flower of perfect shape and rich golden colour; moreover, the large number of plants of this variety are all uniform in height; it is a variety of medium stature. Another golden variety named Golden Crown is also making a good show, and this has very much bigger blooms than Bouton d'Or. The early-flowering Missouri has been out for the past three weeks, and even although it was fading at the time of our visit it still looked very imposing. The season of flowering of this Tulip is in striking contrast to that of the adjacent Herbert Spencer, which is only just in bud. Professor Tendeloo has attracted great interest from visitors because of its rosy-magenta colour with a deep cream edge, making in the mass a very striking display. Grenadier is a good colour—orange-salmon—but the plants are not flowering at all uniformly. The height of this Tulip is about twenty inches. Inglescombe Scarlet was not yet in bloom on the date of our visit and must be included among the late sorts, but Inglescombe Pink, or Salmon Queen, as it is sometimes called, was in full beauty.

The Darwin varieties are making the finest show, and they are the most uniform in their season of flower, although, of course, some are earlier than others. For instance, Baronne de la Tonnaye was not nearly in bloom. Amongst the great wealth of this section it is not easy to make a choice, but the following sorts may be regarded as some of the best; Margaret, with very dainty, globular, rich pink flowers, paler on the outer side, a variety of dwarf habit; Sir Joseph Hooker, one of the best of the dark red Tulips; Marconi, one of the biggest and best of the maroon section, much more massive than The Sultan, and taller in stature; Madame Krelage, one of the tallest of the varieties, but not quite so tall as Sir Trevor Lawrence; Professor Suringar; Sir Harry Veitch, still one of the best of the dark, velvety-red Tulips and excellent in every respect; Centenaire, deep pink; Venus; The Bishop, purple-blue, quite the best of its colour; Pride of Haarlem, one of the grandest of all the Darwin Tulips, of cochineal-carmine colour; Versailles; and Painted Lady, a tall, white variety spotted with pink.

The Breeder varieties show great variation in their season of flowering for while some are in full bloom others are only just in the tight bud stage. Of these we selected Aspasia, Chestnut (syn. La Négrette), a mahogany-coloured variety with a satiny sheen, and paler in the centres of the outer segments, which are edged with gold; Panorama, a fine red Tulip; Lord Byron, scarlet-cerise; Bacchus, a very striking purple colour; Mon. Trésor, and Louis XIV.

## THE GOLDEN-8 MOTH (PLUSIA MONETA).

Now is the time—to borrow a famous phrase—for the gardener to examine the tops of the shoots of his Aconitums and Delphiniums to see if the leaves have an unnaturally tufted or drooping appearance. Should he be at all suspicious that all is not as it should be, let him very carefully separate the twisted and confused-looking foliage and he will probably find amongst it a snug little cavity containing a small, greenish-grey caterpillar, plentifully studded with black spots. This little creature is the young larva of the above moth, which I believe to be the only one of the gardener's insect enemies that does any material damage to his Larkspurs and Monkshoods.

The Golden-8 and the very common, but really beautiful, Silver-Y (*Plusia gamma*) are members of a large and handsome genus of moths, of which many of the species, including these two, are characterised by a strong tendency to emigrate from the places of their birth and spread over the face of the earth, and records

show that the subject of this note has so spread in about fifty years from Russia westwards right across Europe to the shores of the Atlantic. Although it has been common in France and Germany for many years, it was not known in Britain until 1857, when two specimens were captured in Kent and remained for nearly forty years unidentified and unrecorded. In June, 1890, however, an extensive immigration of the moth from the Continent must have taken place, for it was made known by the capture of specimens at Dover, Tunbridge Wells, Reading and Cambridge in June, July and September of that year, and from then up to now it has established itself over practically the whole of

like the rest of its congeners, with some arching of the body, but this is not so marked as in the slimmer larvae of the Geometer moths.

The newly-hatched larvae are, of course, very tiny, and rather maggot-like, with brownish heads and pale bodies dotted with black. They grow very slowly and later feed on the seeds in the capsules; if it is an early season and a favourable summer, they may reach maturity in August to emerge as moths of a second brood in September; but this is not usual in Britain, and the half-inch, young larvae, therefore, go down the hollow stems of their food plants and pass the winter in these at or below the surface of the ground until the plants begin

Photo by Hugh Main, F.E.S.

FIG. 164.—THE GOLDEN-8 MOTH (*PLUSIA MONETA*).

1, "Nests" of larvae on Delphinium shoot; 2, "Nest" on Aconitum shoot, outside; 3, "Nest" on Aconitum shoot, inside, showing young larva; 4, Full fed larva preparing to spin its cocoon; 5, Cocoon on underside of Delphinium leaf; 6, Moth recently emerged; 7, Moth displayed. All natural size.

England and Wales, and can be found more or less commonly wherever the food plants of its larva occur in a wild or cultivated state; but I know of no records from Scotland, Ireland, or the Isle of Man, and shall be glad to be informed of any, with place, month and year of capture. The moth flies in May, June and July at early dusk—say, about 9.30 to 10 p.m. (summer time)—and visits the flowers of its food-plants, as well as those of many other plants for their nectar, which it sucks whilst hovering before the flower. It deposits its cream-coloured eggs in the flower-heads, either amongst the buds or actually on the petals of the open flowers, and in about a week the young larvae hatch and begin to feed amongst the buds and flowers or young seed-vessels. The larva at all ages crawls,

to shoot up again in the spring. Then, in March or April, according to season, the larvae come up and begin to make their little "nests" in the tops of the shoots, and in these they live and devour the buds and neighbouring leaves until their last change of skin, after which they emerge from their cubicles of a clean pale green with a whitish line along each side and feed quite exposed on the leaves until they are fully grown.

By this time the lower leaves of the plants have turned yellow, the larva descends to within about a foot of the ground, and spins a cocoon on the underside of a leaf. This cocoon is boat-shaped, about an inch long and half-an-inch wide and is at first white, but the moisture in the air soon causes it to turn to a bright canary-

yellow, and it is by no means easy to see unless the leaf is turned over. At one end of it is a transverse slit through which the moth will emerge. The larvae turns to a green pupa with an intensely black streak along the back, and this stage lasts about three weeks. After the moth has emerged and its wings have fully developed it closes them over its back and rests head downwards on its support for a time, but later turns head uppermost, stretches its two front legs straight out at right angles to the axis of its body and clings with these and its two hind legs, the middle pair being pressed close to the body. In this curious pose it looks just like a discoloured and curled leaf and is not at all conspicuous.

The colour of the fore-wings is a golden-grey with a brown bar across the middle and a brown line near the tip. The spots in the centre are shining, golden, with brownish centres and in some specimens resemble two tiny gold coins; whence the name, *moneta*. There are other marks and shadings on the wings which are impossible of description, but give them a somewhat netted appearance. The hind wings and other parts of the moth are yellowish grey, and there are wonderful crests of long scales on the thorax between the roots of the wings.

Altogether this insect is beautiful in different ways in all its stages and is worth the little trouble necessary in rearing a few; but, of course, most gardeners will be disposed to take the very material view that as an enemy it merits immediate death.

I am indebted to my friend, Mr. Hugh Main, for the excellent illustration, reproduced in Fig. 164, and to Messrs. Benham and Co., of Colchester, for courteous permission to use the block. C. Nicholson, F.E.S., 35, The Avenue, Hale End, E.4.

## MARKET FRUIT GARDEN.

It was the driest April since 1921. The rainfall in my district was only 1.87 inch, most of which fell during the first nine days of the month. Then followed about a fortnight of glorious weather, during which Plums, Pears and Cherries came into bloom. The two last made a fine show; and Plum blossom was more plentiful than might have been expected after last year's crop. The season being normal, or slightly late, a satisfactory set was hoped for with some confidence. Unfortunately, the frosts of the last week of April, which were unusually severe for this southern district, destroyed most of the bloom of several varieties of Plums, notably Victoria and Pond's Seedling, both of which showed fine promise. Pond's Seedling was particularly full of bloom, and, as the trees have not carried a heavy crop for several seasons, the prospect seemed bright till the disaster occurred. Rivers' Early Prolific and Czar, which bloomed earlier, and had probably got past the most dangerous stage, appear to have escaped injury; and it looks now as though these, with possibly President, will be the only varieties in my plantations to furnish much of a harvest. Monarch carried scarcely any bloom, and Belle de Louvain only a little. Pears and Cherries were not harmed so far as could be seen. As the frost was most severe on the ground, the fate of bush fruits will be watched with anxiety. Whitesmith Gooseberries were badly cut and lost practically the whole of their fruit. Careless, growing in the same plantation, escaped with nothing worse than slight bronzing of the berries. Black Currants, which are showing great promise, were apparently unharmed, though it remains to be seen how much of the fruit will set. Indeed, the full toll of these frosts has yet to be realised. Apples were, presumably, too backward to be in danger, Beauty of Bath being the only variety in full bloom by the end of the month. Nearly all commercial varieties will bloom profusely, and the trees look healthy at the time of writing. Most kinds were still in the pink bud stage when the frosts occurred.

### INSECT PESTS.

So far, insect pests are not plentiful. Aphides are very scarce indeed. The pest most in evidence

is Apple sucker, which is rather more abundant than usual on unsprayed trees. In my own plantations, sprayed with tar distillate winter wash at only six per cent. strength, this insect is entirely absent, the only pest found amongst the bloom clusters being a very few caterpillars. On Plums there are rather more caterpillars, mainly Tortrices, which are evidently not completely controlled by tar distillate at this strength. I do not think, however, that any further spraying for insect pests will be required. Apple blossom weevils were noticed amongst the blossom buds early in the month, and will probably have had a good opportunity to do the maximum of harm owing to the long period during which the trees remained in the bud stage. However, the bloom of Apples will be so abundant that some of it can well be spared.

### SPRAYING AGAINST APPLE SCAB.

Splendid conditions for the pre-blossom spraying for the prevention of Apple scab occurred in the fortnight around Easter. The weather was calm and fine, and the work was concluded with scarcely a drop of rain, an exceptional experience. It was found necessary to go through the plantations twice, as Beauty of Bath was so much more forward than other varieties. The normal Bordeaux mixture (8-8-100) employed caused no injury beyond a check to the development of the leaves surrounding the bloom buds in the case of the variety just named, which seems to be more sensitive to fungicides even than Cox's Orange Pippin. There was no scorching, but the trees of this variety looked less leafy than those left unsprayed. In one plantation I tried lime-sulphur at a strength of one in forty, which, in trials carried out at various places in recent years, proved quite safe when applied before blooming. In my conditions it certainly is not, for it caused a good deal of marginal leaf scorch with several varieties. Experimenters are rather given to reporting "no scorching of any economic importance"; but I doubt whether we should disregard any injury to the young leaves surrounding the bloom clusters, as the tree needs all the assistance it can get to enable it to set a good crop. Having completed this first spraying in such ideal conditions, there should be a good prospect of a satisfactory control of scab this season. I could find no trace of the disease on the leaves up to the end of the month, except in the case of an unsprayed tree of Siberian Crab in my private garden, which is always the first to exhibit scab.

### CULTIVATION DIFFICULTIES.

Pressure of work at certain seasons often prevents one from doing all operations at the best time. The period during which all hands were required for spraying would have been most favourable for horse cultivation and hoeing, especially amongst bush fruits. Very little of this work had been attempted before, owing to the sodden state of the ground during March and early April. What little was done early might almost as well have been left undone, as the heavy rains panned down the soil again. Drying weather, when it did arrive, came too fiercely and lasted too long. The sodden soil dried harshly and, at the time of writing, is so hard that it can scarcely be touched with any implement. My soil, being composed of very fine particles, and naturally lacking in humus, is much given to panning down into a hard state, no matter what is done in the way of ploughing or digging during the autumn or winter. The only remedy that I have found is the obvious one of giving repeated dressings of farmyard manure or some bulky organic substitute such as wool shoddy. On a large scale it is difficult to do enough in this way to affect the texture for any length of time. Under clean cultivation the humus quickly disappears, nothing being visible of an ordinary dressing of farmyard manure at the end of a year. The soil works best for a year or two after the breaking up of turf. I find that, when I grub part of a plantation which has been under grass for some years, treated by the sod mulch system, which obviously enriches the soil in humus, it works well for a time, and gives bush fruits and young trees a fine start. It is distressing to see the land hard and cracked; but a few showers, which are not likely to be

long delayed, will enable rapid progress to be made with cultivators and hand-hoes. Fortunately, weeds have made little headway so far.

### PACKING PLANS.

A good many progressive growers have been packing Apples in boxes for several years, but it was not until 1925 that the packing stations increased the supplies of boxed English Apples sufficiently for them to have a definite influence in the markets. Now, with more packing stations in operation, boxing assumes even greater importance; and it seems likely that growers who wish to keep their reputation for good packing will be obliged to adopt the system. A representative of a leading firm of salesmen, who called on me recently, was very strongly of this opinion. I have for some time boxed some of my best dessert fruit for the London market, and, should this season's promise of a good crop be fulfilled, I shall make preparations for the increased use of this package. In addition to the standard bushel box, there is the newer half-bushel box, which is very attractive for dessert fruit of high grade. This is not the original flat half-box, but one measuring  $14\frac{1}{2} \times 9 \times 9$  inches inside, just the same shape as the bushel box and taking the same diagonal packs. For the very best selected fruits of choice varieties, the single layer tray or Peach box remains the best package. Nested in wood-wool in these trays, Apples and Pears are presented in the finest condition. The grower need not, however, purchase his own non-returnable trays, since most salesmen are willing to supply Peach boxes for this purpose. For the bushel and half-bushel boxes, large labels to paste on the ends are needed. Growers who hope to establish a reputation in the markets will find it worth while to have a label designed for their special use. *Market Grower.*

## VEGETABLE GARDEN.

### RHUBARB.

RHUBARB grows best in deeply-worked, rich soil, and in common with other permanent crops, it pays to prepare the site thoroughly in the first instance. Although the plant luxuriates in moist and cool situations and will tolerate slight shade, stagnant water at the roots must be guarded against.

The common method of propagation is by root division, and when forming a new plantation planting is best done just as growth commences, usually about the end of February or early in March. Propagation may also be effected by seeds.

The first season after planting every encouragement should be given the plants to make as much growth as possible, little attention being necessary beyond keeping the ground clean. A catch crop which does not interfere with the maincrop may be intercropped between the rows the first season.

Most varieties are profuse flowerers, an exception being The Sutton, and all flower-heads should be removed so soon as they are detected. Each winter the crowns should receive a dressing of strawy manure which, when the winter rains have washed the manure into the soil, will consist of practically clean straw, and when this is loosened early in February, will afford a little protection to the young leaves.

When, and how, to gather the stalks is a question worthy of consideration. Nothing except the flowers should be removed the first season after planting, and the following year the quantity of stalks gathered will depend on the strength of the plants; none should be removed if the plants are at all weak. The correct twist to give the stalks when gathering them to prevent the crowns from being removed is not without significance. A large number of leaves should not be harvested at one gathering, and more should be allowed to develop before a second batch is removed. Gathering should cease about early August to allow time for the plants to make plenty of leaves before going to rest. Where Rhubarb is specially required late in the season, a few plants may be reserved for this purpose, and these should not be used for the earlier supplies.

## SOCIETIES.

### NATIONAL AURICULA AND PRIMULA.

APRIL 26 AND 27.—The Southern Section of this old-established Society pursues the even tenor of its way. It has a published list of fifty-two members. The advent of a new member is evidently an event, for the name and address of last year's new member is given a bold heading all to itself at the end of the list of older members. An increase in the membership of a Society is a relatively healthy sign, but against this it seems that half-a-dozen of the older members neglected to pay their subscriptions. In these circumstances, a large show could not be expected, but that which was held in conjunction with the R.H.S. fortnightly meeting on the above dates exceeded expectations, both in extent and in quality. It was naturally a small show, as compared with the annual functions of most other special flower societies, but generally the quality was good and there were many really admirable exhibits to be seen.

Mr. JAMES DOUGLAS was the only trade exhibitor, and he showed a large number of his incomparable Auriculas. Mr. C. G. KIRCH, Edenhall, Beckenham, was an exceedingly successful exhibitor amongst the amateurs and, in addition to many first prizes, he won the handsome James Douglas Memorial Challenge Cup.

#### AWARDS OF MERIT.

*Auricula Redstart*.—A very beautiful self-coloured Show variety. The flowers are of medium size, perfect in form and of bright red colour, with a white eye. The leaves and flower stems are heavily dusted with meal. Shown by Mr. C. G. KIRCH.

*Auricula Rolt's Fancy*.—This is a large Fancy variety. The waved flowers have green margins which give place to rosy-carmine. The eye is white. Shown by Mr. JAMES DOUGLAS.

#### COMPETITIVE EXHIBITS.

There was no exhibit of twelve Auriculas, but C. G. KIRCH, Esq. (gr. Mr. J. Wall), Edenhall, Beckenham, won the first prize in the class for six plants with an exceptionally good collection, which included the new variety Redstart; Edenhall, a good Fancy with green edges, shading to brown, and a white eye; and R. Trail, a powdered, green-flowered variety. E. HERON-ALLEN, Esq., Selsey Bill, was second. There did not appear to be a first-prize exhibit in the class for four Auriculas, but C. G. KIRCH, Esq., was awarded the second prize for four good plants, which included Vesuvius, an attractive Self of bright red colour. Mr. HEWITT PITT, Boxmoor, was first in the class for two plants.

In the classes for single specimens, Mr. A. S. HAMPTON, Reading, won first prizes with Elaine, a grey-edged variety, and with an exceptionally fine plant of Rachel, a white-edged variety. Mr. C. G. KIRCH was second in both classes.

The class for new seedling Auriculas was very interesting. Mr. C. G. KIRCH won first prizes with Son of Zulu, a fine, dark Self; Manby, green-edged; Dr. D. Thomson, white-edged; and Miss A. C. Regnart, a fascinating Fancy. He was also second with Paul Joseph, a good yellow self.

Although there were few exhibitors of Alpine Auriculas the quality of the plants was good. Mr. C. G. KIRCH had the best six plants, amongst which Argus, Majestic and Glow were excellent. Mr. A. S. HAMPTON, Reading, was second. Mr. CLIFFORD BURTON, Selsey, Chichester, showing a fine plant of Majestic in his exhibit, was first in the class for four plants. Mr. HEWITT PITT was first with a good gold-centred alpine; and with six plants in the class for those who had not previously won a first prize, and with a single plant in the same section. Most of his plants were seedlings of merit. With a green-edged seedling Fancy, Mr. HEWITT PITT was first in the class for amateurs only.

Mr. JAMES DOUGLAS was the only exhibitor of twelve Alpine and twelve Fancy Auriculas, and his very good exhibits which were awarded the first prize, included the new variety Rolt's Fancy and other splendid seedlings. Mr.

C. G. KIRCH was awarded the first prize for six Primulas in not fewer than three species or varieties. He showed distinct sorts, including exceptionally good plants of *Primula Sieboldii*, *P. involucrata*, *P. saxatilis* and *P. denticulata*. Mr. G. W. MILLER, as usual, was awarded all the first prizes for Polyanthus and Primroses. Mr. JAMES DOUGLAS received an Award of Merit for a collection of Polyanthus.

#### NON-COMPETITIVE.

A large non-competitive collection of Auriculas, set up by Mr. JAMES DOUGLAS, included very many handsome plants of which the following is a typical selection: Heavenly Blue, of rich blue shades of colour; Jocelyn, shading from mauve to purple; Duke of York, velvety crimson shading to maroon with a golden eye; Harrison Weir, a beautiful new, white-eyed Self; Mrs. Gardener, a velvety old rose white-eyed Self; and Vesuvius, bright brick-red with a white eye. On the first day, Mr. DOUGLAS placed before the Scientific Committee of the R.H.S. an instance of sporting in Auriculas which was unique in his experience. It was a well-grown plant of a new Alpine variety, named Queen of Spain, which had made three growths each producing a large flower truss. Two were normal, bearing large flowers of purple colour shading to deep velvety maroon, while the sport was a larger truss of satiny-mauve flowers shading to crimson lake. Both forms had canary-yellow-coloured centres. Mr. C. G. KIRCH had a seedling Alpine Auricula bearing several trusses of velvety-purple flowers with two rows of petals.

#### Northern Section.

In an upper room of the Church House, Houldsworth Hall, Deansgate, Manchester, the fifty-fifth show was held on April 30, and it was in every way a success for those who love the quiet recreation and relaxation of the garden. Alpine flowers are a great joy to the eager and expectant cultivator, and of these the Primula, Auricula and Polyanthus are firm favourites, as well for their easy cultivation and propagation as for the wealth of their bloom. No plants are hardier, none take up so little room, and they are spring flowers.

As a florists' flower the Auricula is generally grown as a pot plant in the cool house or in a cold frame in and about towns, but in the pure country air it may be cultivated, with loving care, outside in the garden. The air of the higher altitudes is especially favourable to the development of the colour and substance of the bloom and the vigour of the leaf.

An object lesson of culture on the hills was seen in the class for gold-centred seedlings of Alpine Auriculas, shaded, in the specimen Sir Daniel, raised by Mr. HALL, of High Lane; its brilliancy of colour was a tribute to the skill and assiduity of its raiser and a testimony of its environment. Mr. HALL grows his plants high up on the hills. We call to mind specimens grown at Windermere by Col. Walker, especially gorgeous plants of Midas, and in a lesser degree, of Lucrece, seedlings of John Tonge.

A fine truss of Dr. Pegge, bright and burnished, was the outstanding feature of the first pan of six dissimilar alpine Auriculas, shown by Mr. K. THOMPSON; in this class the competition was keen, and Moonlight, Perchance and Argus were noteworthy examples. Col. WALKER had a fine specimen of a light-centred flower in J. T. Bennett-Po—a time-honoured name—and Muriel (Faulkner) a well-balanced flower; Joy (Thompson) a seedling, white-centred and shaded wine colour; and Doris Parker (Thompson) in red and gold, were all worthy of praise. Every sign of vitality and of high quality was evident in the seedling alpine sorts that were exhibited.

Of the show flowers the green edges were the most pleasing. Tom Battersby (Faulkner), with a black body colour and delightful green edge, had a lovely sheen which betokened health and vigour; other good varieties were Homer, with its pleasing yellow tube; George Rudd, Orient, A. Barker, Greenhead and Richard Headley, while Ossian was flat and smooth. Other good plants included a white-edged seedling, The Moonlight (Attwood), a seedling self, Scarlet Emperor

With fair treatment and periodical feeding, a bed should last in good condition for several years. It is advisable to make a new plantation so soon as the old one shows signs of deterioration.

Forced Rhubarb is in great demand from Christmas to about the end of February, and the plant is amenable to forcing and easy to manage. Forcing may be divided into two distinct methods: (1) lifting the roots and placing them in any suitable structure where a temperature of about 55° to 60°F. can be maintained; (2) covering the crowns with strawy manure in the position in which they are growing. The latter method may be more correctly described as "forwarding," and may be conveniently adopted following the period when the forced supplies are available and before the natural supplies from the open are ready.

The crowns selected for forcing should be strong and, for preference, specially grown for the purpose; that is, have had no leaves removed the previous season. For earliest forcing, lift the roots when the leaves have died down in autumn and allow them to remain exposed on the ground where they can receive the beneficial effect of a few degrees of frost. All manner of structures may be utilised for forcing, provided a warm temperature can be maintained and sunlight excluded. The crowns may be stood closely together and a little fine soil should be worked between them and watered in.

Roots in the open, covered with special pots, deep boxes or barrels, under a good thickness of fermenting materials, will furnish leaves early in January. Gathering should be possible by this method in about four or five weeks. It is not necessary to grow a large number of varieties in private gardens, but it is desirable that at least one should be early. One of the earliest is Mitchell's Royal Albert, and others of superior merit are Hawke's Champagne and Daw's Champion, both of which follow very closely on the first-named.

Where a succession of varieties is desired, Linnaeus and Victoria should be selected. The Sutton is a most attractive and valuable mid-season variety. For forcing purposes, Hawke's Champagne and Daw's Champion are the best. In a trial row in progress here, about thirty distinct varieties are represented. J. Wilson, Wisley.

## HOME CORRESPONDENCE.

**Effect of Shade on Apple Scab.**—An interesting observation is made by Mr. E. Brown (p. 305) who finds that trees that are shaded during part of the day are less subject to scab than those that are fully exposed. I have never noticed whether this is the case in my plantations, but shall have plenty of opportunity to do so during the coming season if the disease is troublesome. I am entirely in agreement with him that exposure is no remedy, in spite of all that is said about the benefit of light and air. This is shown by the fact that young trees, planted wide apart, and not nearly filling their spaces, are often badly affected with scab. Last season trees in a plantation consisting mainly of Cox's Orange Pippin, eighteen feet apart, in their third year from planting, were very badly scabbed on the young wood. *Market Grower*.

**Pear Verulam.**—I was much interested in Mr. J. Arnold's article on the above Pear (p. 288) and to learn that his experience of the regular cropping powers of the variety coincides with that of Sir James Bruton. It is unfortunate that such a prolific variety should produce fruit of only second-rate quality, for although Sir James Bruton's Pears, which are grown on a wall, are acceptable in the New Year if there is nothing better available, Verulam cannot be placed in the front rank of dessert Pears by any means. Few people, I venture to state, have previously heard the story of the origin of Verulam Pear as told by Mr. Arnold, and if we had the histories of many of our well-known Apples and Pears they might be equally as interesting if not so romantic. G. H. Hollingworth.

(Thompson), smooth and round and bright; Golden Glory (Thompson), of Buttercup-yellow, an improvement on the usual Cowslip-coloured yellow self.

In the big event, Class 1, for six dissimilar show Auriculas, there was little to choose between the two very fine sets of Mr. K. THOMPSON and Mr. C. FAULKNER; seldom are two sets shown so nearly alike in points. Mr. THOMPSON, first, had a fine truss of a Shirley Hibberd, a grand old green-edge raised by Ben Simonite; this specimen (which obtained the premier prize) undoubtedly turned the scale in favour of Mr. THOMPSON. Mr. FAULKNER had an attractive and well-set-up six, but, unfortunately, Richard Headley, his grey-edged specimen (a seedling of old Lightbody's) had pips that were not fully expanded. There were to be seen several instances of pips that needed flattening, a fault that may be ascribed to under development.

The Gold-laced Polyanthus that were staged were not so numerous as one could desire, but the quality of the blooms seen was refined and jewel-like; I noted a good specimen of Hesse, a red ground, although its lacing did not quite cut through. We missed some of the older dark grounds, such as Blink Bonny. None of the centres had the foxy look so frequently found in a group of seedlings in the bed: these must not appear on the show table, where centres must be of gold, solid in colour, and twenty-two carat in tint.

Some of the growers were lamenting the difficulties of keeping the old sorts alive, such as Lightbody, Acme, George Rudd, A. Barker, Mrs. Henwood, Lancashire Hero and Traill's Beauty.

Change of environment was suggested, but, alas! individual sorts die out and newcomers are scarce.

The Society in its report and schedule of prizes gives explicit instructions for the cultivation of show Auriculas, and particulars that are most useful in the raising of seedlings. The outcome of long experience of the members of the Society is set down in order to assist and encourage the new grower. It also gives lists of hardy Primulas for rockeries and for the cool house; a list of suitable show varieties; hints as to treatment and the proper compost for their growth. This little pamphlet may be had from the Hon. Secretary of the Society, Mr. C. F. Faulkner, Warwick Lodge, Hale, Cheshire, for one shilling. C. W. N.

## GLASGOW AND THE WEST OF SCOTLAND HORTICULTURAL.

At the monthly meeting of the Glasgow and West of Scotland Horticultural Society, on Wednesday, the 20th ult., Mr. Euan H. M. Cox delivered a lecture entitled "Through Burmah with Reginald Farrer," with lantern illustrations. Mr. Thomas Dagg presided.

Mr. Cox at the outset made reference to the introduction of new plants into this country from the Andes, China and other places, and commented on the fact that many of the Rhododendrons, Lilies, etc., which were found to be not quite hardy in this country when raised from introduced seeds, became hardier when the plants were grown from home-raised seeds. After describing the character of the country in Upper Burmah, he referred to the abundant vegetation formed on the hills up to an altitude of 12,500 feet, and stated that in a thirty-five mile area they found forty-nine Rhododendrons, twenty-three Primulas and eleven Magnolias. In this connection the lecturer mentioned that several of the subjects were being grown in the Botanic Gardens at Glasgow and Edinburgh and at Pollok Gardens and Logan Gardens in Wigtonshire. Among the many discoveries were two acres of a Lily in various forms, *Lilium Brownii* growing among ordinary Bracken, and a Peach which ripens green and provides good eating. The latter is being raised in England for hybridising. There was also a tree the wood of which was in great demand for coffin-lids. It took on a fine polish or lacquer, and the Chinese paid big sums to possess it.

This particular tree was now growing in this country.

Sir John Reed expressed his appreciation of the lecture and commented on the cultivation of Rhododendrons in the west of Scotland.

Sir John Stirling Maxwell said it was a great privilege to hear an expedition described at first hand. He pointed out the necessity of taking care of the first generation of plants sent home so that they might establish in this country a fine and hardy race. He had been trying some of the seeds at Pollok, and his wish was to distribute them as widely as he could. There were enough for everybody, and he would be very glad to hear from any person who possessed the facilities for trying them.

A First Class Certificate was awarded to Mr. PETER AITKEN, Bathgate, for a well-arranged exhibit of rock plants numbering about forty varieties.

## ROYAL HORTICULTURAL,

MAY 10 and 11.—Notwithstanding the imminence of Chelsea Show, there was a grand exhibition at Vincent Square on these dates, the hall being filled to its utmost capacity with brilliant and interesting exhibits. The Darwin and Cottage Tulips provided great splashes of colour, as the several groups of these useful flowers were of considerable size and distributed throughout the hall. Flowering trees and shrubs, alpine and border flowers, Schizanthuses, Sweet Peas, Gardenias, Rose and Carnations were other attractions, while a large exhibit of finely-grown Cucumbers attracted a great deal of attention. Orchids were few in number. Novelties were fairly numerous and interesting. The cultivators of old-English Florists' Tulips had a small show of their own in the Orchid Annex.

## Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the Chair), Mr. Gurney Wilson (Hon. Secretary), Mr. J. E. Shill, Mr. H. G. Alexander, Mr. Fred K. Sander, Mr. T. Armstrong, Mr. Dye, Mr. R. Brooman White, Mr. Wilson Potter, Mr. Stuart Low, Hon. H. D. McLaren and Mr. J. Cowan.

## AWARDS OF MERIT.

*Laelio-Cattleya Santa Claus* var. *Lord Lambourne*.—A very handsome variety with purplish rose sepals and petals and a rich ruby-coloured lip, edged with purple, with a bright golden base and brown markings. Shown by Messrs. STUART LOW AND CO., Jarvisbrook.

*Miltonia Kennie* var. *Rosalind*.—An attractive and quaintly marked variety with rose-pink sepals and petals, and a white pink-tinted lip heavily marked around the dull yellow mask with rose-red, this colour radiating in lines of irregular spottings almost to the margin. Shown by Messrs. BLACK AND FLORY, Slough.

## GROUPS.

The central feature in Messrs. SANDERS' group was a large example of *Dendrobium thyrsiflorum* carrying ten of its handsome pendant racemes of white and gold flowers; another plant of this species carried fifteen somewhat smaller racemes. *D. chrysotoxum* was also conspicuous, as were plants of the fragrant *Cattleya citrina*. Other interesting and useful subjects were *Bulbophyllum Lobbianum* var. *Colossus*, *Odontioda Westonbirt Beauty*, *Miltonia Bleuana*, *Dendrobium Falconeri* and the rare *D. cariniferum*, and *D. Draconis*, both rarely seen nowadays. *Odontoglossum platycheilum* and *Musdevallia gemmata* also attracted attention.

MESSRS. CHARLESWORTH AND CO. exhibited a small group of small but beautiful plants of *Miltonia Lucia*, M. Wm. Pitt, M. Princess Mary, M. Charlesworthii, M. Beau Brummel and M. Isabel Sander. *Cypripedium Henry Smith*, *Odontoglossum Proteus*, and *O. Crethus* were also attractive.

Messrs. BLACK AND FLORY showed a three-flowered spike of a lovely form of *Brasso-Cattleya* Mrs. Robert Paterson, in which the ample blooms were of fine substance, with the rich purple lip edged with mauve.

## Floral Committee.

Present: Section A.—Mr. Henry B. May (in the Chair), Mr. J. F. McLeod, Mrs. Helen L. Smith, Lady Beatrix Stanley, Mrs. Ethel Wightman, Mr. Wm. Howe, Mr. H. J. Jones, Mr. Donald Allan, Mr. D. Ingamells, Mr. Hugh Dickson, Mr. M. C. Allwood, Mr. J. M. Bridgeford, Mr. E. R. Janes, Mr. W. H. Page, Mr. A. E. Vasey, Mr. James H. Riding, Mr. J. T. West, Mr. W. B. Gingell, Mr. D. B. Crane, Mr. H. R. Darlington and Mr. Courtney Page, and Mr. W. D. Cartwright (Secretary).

Section B.—Mr. Charles T. Musgrave (in the Chair), Mr. W. J. Bean, Mr. G. Reuthie, Hon. Henry D. McLaren, Mr. F. G. Preston, Mr. Reginald Cory, Mr. R. W. Wallace, Mr. A. Bedford, Mr. G. Yeld, Mr. R. D. Trotter, Mr. T. Hay, Mr. R. C. Notcutt, Mr. E. H. Wilding, Mr. C. Williams, Sir William Lawrence, Bt., and Mr. N. K. Gould (Secretary).

## AWARDS OF MERIT.

*Carnation Brilliant Improved*, Page's variety.—This is a vividly beautiful perpetual-flowering Carnation. The flowers are large and shapely and borne on stout, erect stems. The colour is a bright cerise-scarlet. Shown by Mr. W. H. PAGE.

*Dianthus Allwoodii* var. *Ann*.—One of the free-flowering hybrids commonly known as "Allwoodii." The flowers showed a tendency to curl, but they were unusually large for the type and fully double. The colour is milk-white with a basal crimson-lake blotch. Shown by Messrs. ALLWOOD BROS.

*Dipelta floribunda*.—This uncommonly beautiful deciduous shrub was first discovered in China in 1875, but it was not introduced to this country until 1902. The leaves are ovately-lanceolate and downy on both surfaces when young. The flowers are much like those of the Catalpa in shape, pink flushed outside, white within, and have golden markings on the lip. Shown by Lt.-Col. MESSEL, Nymans, Haywards Heath.

*Hydrangea King George*.—This and the following variety belongs to the batch of seedlings referred to a fortnight ago. It bears a large, shapely truss of rounded flowers of bright rose-pink colours. The margins are coarsely but regularly serrated.

*Hydrangea Queen Mary*.—In size of truss and the individual flowers this is a splendid companion to the foregoing. The margins are prettily serrated and the colour is a soft shade of pink. Both varieties were raised and shown by Mr. H. J. JONES.

*Ranunculus asiaticus*, *Improved Palestine Strain*.—A large vase of very beautiful flowers was shown: the blooms were all large, shapely, fully double, and in many cases, of lovely colours. We understand that these flowers represent Dr. Ragioneri's strain of which an illustrated account appeared in *The Gardeners' Chronicle* of July 26, 1924. Shown by Messrs. WATKINS AND SIMPSON.

*Staphylea Coulombieri*.—Although, beyond the fact that it was first grown in the famous arboretum of Segrez, the history of this deciduous shrub is unknown, it is generally supposed to be a hybrid between *Staphylea colchica* and *S. pinnata*. It is of more vigorous habit than either of the reputed parents, and the panicles are larger. The flowers are white, fragrant, and the flower-buds are lightly tinted with rose-pink. It is a handsome and desirable flowering shrub. Shown by Lt.-Col. MESSEL.

*Staphylea Coulombieri Hessei*.—In comparison with the foregoing, this is an inferior shrub. As shown, it differs in being less vigorous, in the panicles being smaller, and in the flowers being a dingy white flushed with pale purple. Shown by Lt.-Col. MESSEL.

*Fothergilla major*.—This is quite an old shrub and was grown in this country so long ago as 1870. The sprays now shown were unusually vigorous, and the erect, cylindrical spikes of flowers were exceptionally long. The flowers have no petals and owe their beauty to the pinkish stalks of the clustered stamens. Shown by Lt.-Col. MESSEL.

*Meconopsis grandis*.—This "Blue Poppy" was fully described and figured in *The Gardeners' Chronicle* of June 17, 1905. The plant now shown had one fully-opened flower on a stalk about two feet in height. The flower was fully five inches across, and the pale blue segments are lightly lined and flushed with purple. Shown by Mrs. WALTER JONES (gr. Mr. F. Brooker), Aberuchill Castle, Perth.

*Myrsine africana*.—An interesting little evergreen shrub widely distributed over the Himalayas, China, the Azores and mountains of East and South Africa. It bears small, box-like leaves which are aromatic. The sturdy little bush shown bore large numbers of minute, purplish flowers in the axils of the leaves, and also a few of last year's berries, which are much like those of *Pernettya mucronata* in shape, and stained blue-black. Shown by Lt.-Col. MESSEL.

*Gentiana pyrenaica*.—This attractive, little Gentian was introduced in 1825, and is figured in *Bot. Mag.*, 5,742. It makes a neat little plant with pale green leaves, and has solitary, shining, blue flowers, with a white base and golden stamens. Shown by Mrs. WALTER JONES.

#### CULTURAL COMMENDATIONS.

*Conandron ramondiioides*.—A vigorous plant bearing luxuriant leaves and spikes, white flowers, flushed with purple, was shown. The species was introduced from Japan in 1879. Shown from the CAMBRIDGE BOTANIC GARDENS.

*Gentiana verna*.—An earthenware trough, fully two feet long, and well-filled with healthy plants bearing large numbers of flowers, was shown by N. W. JENKINS, Esq., Trimmers Hill, Hindhead.

#### GROUPS.

A large and handsome group of *Schizanthus* hybrids was exhibited by LORD LECONFIELD (gr. Mr. F. Streeter), Petworth Park, Sussex. These large plants all illustrated first-class cultivation, and embraced many beautiful colours. This fine group was edged with equally well-grown plants of *Astilbe*. Messrs. STUART LOW AND CO. displayed some especially well-flowered *Mimosas*, mostly *Acacia armata*, also *Boronia heterophylla*, *Metrosideros floribunda*, *Azalea indica alba* and *Hippeastrums*. Some tall plants of the old favourite *Gardenia florida* were shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree.

Messrs. JOHN PEED AND SON again staged a large collection of their excellent *Streptocarpuses*. As before, the plants were especially well grown and illustrated a first-rate strain of most beautiful colours. Well-flowered *Hydrangea hortensis* were shown by Messrs. WM. CUTBUSH AND SON. Messrs. SUTTON AND SONS exhibited a small group of *Cineraria* Feltham Beauty and white Stock All-the-Year-Round. Particularly well-grown plants of Intermediate Stock were displayed by Sir HUGH MURRAY (gr. Mr. A. Witt), Bramble Hill, Lyndhurst.

Roses were shown by Mr. PEMBERTON, who grouped *Polyantha* varieties effectively; by Messrs. F. CANT AND CO., who had a pretty group of standards and dwarfs; by Mr. ELISHA J. HICKS, who included good vases of *Padre*, *America*, Mrs. H. Wimet, Coral Cluster and Mrs. George Norwood; and Messrs. B. R. CANT AND SONS, who showed Orleans, Phoebe and other good varieties. Messrs. REAMS-BOTTOM AND CO. had an attractive display of their St. Brigid *Anemones*.

Carnations in good condition were shown by Messrs. C. ENGELMANN, LTD., who had large vases of White Pearl, Circe Improved and Red Laddie. Messrs. STUART LOW AND CO. included Philip Sassoon, Ruby Glow and Master M. Stoop; while Messrs. ALLWOOD BROS had vases of Spectrum, Wivelsfield Apricot and Mary Allwood, and also showed their *Dianthus* Allwoodii.

The first exhibits of Sweet Peas for the year made a bright display. Near the Tea Annexe, Messrs. DOBBIE AND CO. had a considerable group, which included several of next year's novelties, as yet unnamed, Gleneagles, Mary Rose, of pink shades; Wild Rose, George Sawyer, Mrs. Tom Jones and Eclipse. Messrs. ROBERT BOLTON AND SON had three large stands

of their excellent novelties, Challenger, a beautiful waved flower of pink shades; Jessie, a lovely salmon-pink; and Mrs. A. Searles, the N.S.P.S. Gold Medal variety of last year.

Under the clock, Messrs. G. AND H. CUTHBERT staged a collection of very floriferous Japanese Azaleas, including the varieties Glow and Sylphe. Near by, Messrs. KELWAY AND SON showed Tree Paeony L'Esperance, Lupins and *Cineraria* Kelway's Perfect Model Double, in several colours.

Alpines, both planted in small rock gardens and set out in pots were freely shown. Messrs. W. H. ROGERS AND SON included Campanulas, dwarf Veronicas, Primulas and Phloxes. Messrs. MAXWELL AND BEALE showed *Daphne Cneorum*, *Androsaces* and *Linum alpinum*. Mr. F. G. WOOD included dwarf Phloxes, *Daphne Cneorum*, *Polyanthuses* and Brooms. The Misses HOPKINS had an attractive rock garden, and Messrs. HODGSONS, LTD., had good batches of *Primula Veitchii*, Irises, *Alyssum saxatile* and *Genistas*.

Mrs. WALTER JONES (gr. Mr. F. Brooker), Aberuchill Castle, Perth, exhibited an attractively arranged collection of *Meconopsis* which included unusually well-grown plants of *M. grandis*, *M. quintuplinervia* and the variety major, *M. betonicifolia*, and *M. integrifolia*. *Gentiana verna*, *Incarvillea grandiflora*, dwarf Phloxes and other rock garden plants were shown by Messrs. WATERER, SONS AND CRISP. Mr. G. H. DALRYMPLE again showed varieties of *Primula pulverulenta* with *P. littoniana*.

An admirable rock garden was made by Mr. CLARENCE ELLIOTT, and planted with generous breadths of *Gentiana acaulis*, *Anemone sylvestris*, *Primula farinosa*, *Dianthus alpinus*, *Campanula Stevenii* and other alpinas. Mr. J. ROBINSON had Violas, Phloxes and Saxifrages. Messrs. B. LADHAMS, LTD., had a large collection of *Trollius*, *Myosotis* Orion, of intense blue colour, Violas, Irises and other spring flowers. Some excellent *Trollius*, in named varieties, were staged by Messrs. BAKERS, LTD.

In a well-arranged exhibit, the CENTRAL GARDEN SUPPLIES showed *Ranunculus graminifolius*, *Saxifraga aizoon*, *Helianthemums* and other rock garden plants, with well-flowered bushes of *Kalmia latifolia* and dwarf Conifers. Messrs. M. PRICHARD AND SON staged *Dodecatheon Media*, *Cypripedium montanum*, *C. pubescens*, *Oxalis adenophylla* and a number of plants of *Saxifraga pyramidalis* bearing long, graceful sprays of flowers.

The MAYTHAM GARDENS had a pretty group of Lupins in good colours, Paeony Avant Garde, *Choisya ternata*, *Primula japonica atrosanguinea* and *Cianthus puniceus*. Mr. JAMES DOUGLAS again staged some of his very good Auriculas. Messrs. J. CHEAL AND SONS had flowers of Dahlias.

An attractive group of shrubs arranged by Mr. R. C. NOTTCUTT included *Fremontia californica*, *Pyrus Sargentii*, *P. Eleyi*, *P. Scheideckeri*, *Cytisus kewensis*, *C. Dragon Fly*, *C. Donard* Seedling, various Lilacs and Maples. Messrs. L. R. RUSSELL, LTD., staged large specimens of *Wistaria sinensis*, with Brooms, *Pittosporums*, *Ceanothuses* and other shrubs. Mr. J. KLINKERT had well-grown topiary specimens.

#### Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (in the Chair). Mr. G. W. Leak, Mr. Rollo Meyer, Sir Daniel Hall, Mr. J. Jones, Mr. C. Tichmarsh, Mr. C. W. Needham, Mr. F. Secrett, Miss Willmott, Mr. Alfred W. White, Mr. Duncan Pearson, Mr. G. Churcher, Mr. Herbert Smith, Mr. Charles H. Curtis, Mr. Peter R. Barr and Mr. A. Simmonds (Secretary).

The Committee had a busy session, as in addition to considering the merits of numerous novelties in Tulips and judging groups of Tulips, it made a final draft of the varieties of Daffodils that are to be used as standard sorts for the Wisley trials.

#### AWARDS OF MERIT.

*Tulip Mars*.—A handsome and bold Darwin variety of deep orange-scarlet colouring, with a yellow base, this basal colour showing also on the outside. The segments are rounded and substantial. Shown and raised by Sir Daniel Hall, Merton, Surrey.

*Tulip Bronze Wings*.—In this elegant variety the flowers are of a ruddy bronze hue, shading to golden bronze towards the margins of the outer segments. The base is bronzy-blue. Shown and raised by Sir DANIEL HALL, Merton.

#### GROUPS OF TULIPS.

The many collections were of great beauty, and as the day advanced the blooms opened widely, making a gorgeous display. Messrs. DOBBIE AND CO. filled a large space with an excellent collection of Darwin, Cottage and Parrot Tulips, which was arranged with great taste and skill. Their Parrot Tulips included Lutea, Sensation, a beautiful feathered flower, and Zany, of scarlet and gold colouring. Amongst the many Cottage Tulips we especially admired Mrs. Moon, yellow, Picotee, and Avis Kennicot, bright yellow. The chief of the Darwins were Dom Pedro, a handsome bronzy flower; La Tulipe Noire, of very dark, almost black, maroon; Panorama, orange-cardinal; Europe, scarlet; Orange Perfection, King George, rose-pink; The Giant, purple, and Zwanenburg, white. Besides these there were handsome vases of *Gesneriana lutea* and the brilliant *Gesneriana major*.

There were many of the beautifully-marked Old-English varieties in the splendid collection set up so well by Messrs. BARR AND SONS. The chief of these fascinating Tulips were Troubadour, white with lilac markings; Gloria Mundi, purple and yellow; Bartlett, red with white feathering, and Esopus, rose-pink, flaked with white. Amongst the many Darwins we especially admired the duskiness of La Tulipe Noire and of Zulu; Gwydr, pale heliotrope; Roi de Siam, rich purple; Clara Butt, pink; Velvet King, deep maroon; Vesta, white; Margaret, soft pink; Louis XIV, bronzy purple, and Ellen Willmott, a large yellow variety of *Tulipa retroflexa* type.

Near the gallery, Messrs. PEARSON AND SONS had a good collection, chiefly of Darwin varieties, of which we select for special mention the vases of Europe, scarlet; Farncombe Sanders, crimson; Orion, rich rose-pink; Cararra, white; William Copland, mauve shades; Faust, deep maroon; Scarlet Emperor and Edm'e, pink. Messrs. R. H. BATH, LTD., included in their collection of well-grown flowers, vases of Viking, deep purple; Princess Elizabeth, rose-pink; White Queen; Professor Michael Foster, deep rose-pink; Bronze Knight, golden bronze, and Prof. Francis Darwin, crimson.

The Rev. ROLLO MEYER, Watton Rectory, showed massed vases of The President, orange; Inglescombe Pink; Goudvink, purple with orange shading in the edges, and Golden Bronze. Mr. G. W. MILLER had Tulips and *Polyanthuses*. The former included Zulu, William Pitt, Baron de la Tonnaye, Harry Veitch and Europe. In the collection arranged by the BRONWYLLA FRUIT FARM there were vases of Marconi, pink; Loveliness, soft pink; Marie, deep rose-pink; Inglescombe Yellow; The Fawn and Psyche, pink shades. Messrs. J. J. GRULLEMANS AND SONS had a small collection of Darwin varieties.

In a goodly collection, Messrs. D. STEWART AND SON had vases of Jubilee, deep purple; *Gesneriana spatulata*, Purple Perfection, Mrs. Moon and Picotee. The WELSH BULB FARMS staged vases of Massachusetts, pink; Ida Scott, purple; Glow, crimson; Afterglow, lovely orange-crimson; *Gesneriana lutea* and Louise de la Vallière, deep rose. Mr. H. G. LONGFORD staged many good varieties including Zany, the attractive Parrot Tulip; Alaska, yellow Darwin; Dulcinea, deep rose Darwin; Dido, salmon-pink; and Prince Albert, a Darwin with attractive bronzy shading to the margins.

#### Fruit and Vegetable Committee.

Present: Mr. A. H. Pearson (in the Chair), Mr. J. Cheal, Mr. H. S. Rivers, Mr. P. C. M. Veitch, Mr. G. Tinley, Mr. H. Smith, Mr. E. Laxton, Mr. W. Giles, Mr. H. Prince, Mr. W. H. Divers, Mr. E. Beckett, Mr. E. A. Bunyard and Mr. A. N. Rawes (Hon. Secretary).

It was resolved to send a message of condolence to the Chairman, Mr. C. G. A. Nix, on the death of his brother, Mr. John Nix, of Tilgate

Manor, Crawley. The late Mr. Nix was a frequent exhibitor of fruits at the R.H.S. meetings; his gardener, Mr. E. Neal, is a member of the Fruit and Vegetable Committee.

The only exhibit before this Committee comprised twelve varieties of Cucumbers, from LORD LECONFIELD's gardens at Petworth Park, Sussex (gr. Mr. F. Streeter). The quality of the fruits was exceptionally high, and the bloom on the skin was finely developed, exemplifying high cultivation. The varieties were Matchless, Ideal, Every Day, Satisfaction, Delicacy, King George, Model, Lookie's Perfection, Jasper Queen, Peerless, Tender and True, and Constitution.

### DUNDEE HORTICULTURAL

The usual monthly meeting of this Society was held in the Training College, Park Place, on Friday, the 22nd ult.

The lecturer for the evening was Mr. E. H. M. Cox, of Glendock, and his subject, "Alpines." Mr. Cox stated that the stones in a rock garden should be placed naturally, with the weathered surfaces outermost and the strata running in a direct line, as though they had been there permanently. An essential feature of a rockery was good drainage, as many alpine plants in their native haunts grow in gravel with practically no soil. The lecture was illustrated by coloured lantern slides, which showed plants growing on rockeries on a large and small scale.

Messrs. STORRIE AND STORRIE, Glencarse Nurseries, exhibited *Primula obconica gigantea* and *Schizanthus*, for both of which the Committee awarded a Cultural Certificate.

### GERMAN HORTICULTURAL

UNDER the title of "Flowers from Home and Abroad," the German Horticultural Society organised in the Berlin Town Hall, from April 13 to April 20, a Spring Horticultural Exhibition, which proved very successful and attracted large numbers of visitors. In the late summer of last year an exhibition was attempted by the same Society, with limited success, owing to cramped accommodation and other causes; but this partial failure was of value in showing the organisers where shortcomings were likely to occur, and their readiness to learn by past experience was in the present instance fully rewarded.

The floral decoration of the rooms was excellently done, especially the surroundings of the "Spring" in the hall known as the Lichthofe. Rather less happy was the arrangement of the Obersaal, almost filled with a very large central bed, in which yard-high Cactuses and Cinerarias were accommodated. The Hydrangeas, however, beautifully arranged and in the pink of condition, made up for many shortcomings in other directions; the superb Wintergalen group won the coveted Prussian Government Medal, and the Matthes exhibit on the next stand seemed equally meritorious in its own way. In the Lichthofe, as well as the pretty "Spring," were the Azaleas and Rhododendrons shown by the firm of KARGER, and a collection of enormous, brightly-hued Hydrangeas from DEHMLOW's, of Heinersdorf. Mr. ARTHUR BRAND showed fine Roses, and Mr. DE COENE, pot Figs. A collection of more or less rare warm-house plants, including *Medinilla magnifica*, in full bloom, came from the Government Gardens at Sanssouci, of which Herr Kunert is the Director. Orchids, Carnations, cut Roses and brightly-coloured Calceolarias were all well-shown by specialists in each line; and two landscape gardening firms showed miniature rock gardens. Some of the German horticulturists were inclined to frown upon this latter section, as being unsuitable for an indoor exhibition, but it was very popular with the public and attracted considerable favourable attention.

Another somewhat unconventional feature, which likewise proved a valuable attraction, was the presence of a large number of German and foreign song-birds, the Berlin Cage-Bird Association having combined with the Horti-

cultural Society in organising the exhibition. The song of the birds agreeably enlivened the show, and not much exception could, perhaps, be taken to their presence.

### MORAY FIELD CLUB.

THE annual meeting of the members of this Club was held in Elgin Museum, the Rev. George Birnie, B.D., Speymouth, the President, in the chair. Mr. J. J. Burgess, M.A., Secretary and Treasurer, presented the financial statement, showing a credit balance in favour of the Club. The Chairman, after extolling the services of Mr. Burgess, who had held office for twenty-five years, reviewed the work of the Club last year, and mentioned that Dr. Douglas Simpson, Librarian of Aberdeen University, a noted authority on ancient architecture in Scotland, had promised to accompany members of the Club to Spynie Palace and Duffus Castle during the coming season, and to tell them something about these historic buildings. Mr. H. B. Mackintosh, a well-known Morayshire historian, had also consented to act as cicerone during the Club's visit to the port and loch of Spynie. Warm thanks were expressed to Dr. Simpson and Mr. Mackintosh for their kind offers.

The following arrangements for excursions were provisionally made:—May 14, Blackhills; May 21, Kellas; June 11, Greshop Woods, Forres; June 25, joint excursion with the Literary and Scientific Association, under Dr. Douglas Simpson's guidance, to Spynie Palace, Duffus Castle, and Burghead; July 9, Rothes; August 20, Richmond-Gordon estates, Fochabers; September 3, to Spynie Loch and port, with Mr. H. B. Mackintosh; September 17, forestry demonstration at a place to be fixed later.

### TRURO SPRING FLOWER SHOW.

THIS show, which opened at Truro, on Tuesday, April 26, afforded a demonstration of what the Cornish climate will produce. Although Rhododendrons were not as good as in previous years, this was expected owing to prolific flowering in 1926 and the heavy gales of the present spring. The Lord Lieutenant of Cornwall, J. C. WILLIAMS, Esq., put up a unique collection of hybrid Rhododendrons. In this collection was a particularly fine *R. Maddenii* × *R. cinnabarinum* cross.

Another feature of the show was a new seedling *Leptospermum scoparium*, exhibited by the Rev. A. T. BOSCAWEN, Ludgvan, with particularly large and semi-double flowers.

The Tulip classes were well filled, Col. PAYNTER excelling with excellent Darwin varieties. Collections of shrubs form one of the most attractive features of these shows, and it was very regrettable that the Rev. A. T. BOSCAWEN was not showing in this section, as he has for years taken the premier award, and his action this year can only be regarded as that of a sportsman in order that other people might have a chance. The first prize exhibit of Mrs. BOLITHO, of Trewithen was very fine. It contained excellent examples of *Drimys*, *Erica melanthera*, *Enkianthus* and *Eriostemon nerifolium*. The second prize was won by Mrs. HEXT, who had fine specimens of *Buddleia Colvillei*, *Cytisus proliferus* and *Exochorda*.

Acacias were also much in evidence, and in the class for three vases of these, Viscount FALMOUTH was placed first with well-grown examples of *A. verticillata*, *A. longifolia* and *A. melanoxylon*.

Flowering Cherries were another feature of the show, and in the prize-winning exhibit of Mr. A. M. WILLIAMS were some beautiful specimens of *C. Hisakara*, *C. Veitchii* and *C. Lannesiana*.

There was a welcome increase in the number of alpine exhibits, and many of these contained choice, well-grown specimens.

Traders were represented by Messrs. R. VEITCH AND SON, Exeter, whose outstanding plants were *Kennedyia ovata*, *Prostranthera nivea* and *Statice profusa*; by Messrs. TRESEDER, Truro, and Mr. RUSE, Falmouth, who had their usual exhibits of choice shrubs and flowering plants; by Messrs. MAXWELL AND BEALE,

Broadstone, Dorset, who had a very prettily arranged rockery and Heath garden; by Mr. JAMES COCK, of Hayle, who showed Tulips, Anemones and Trollius; by Messrs. REAMS-BOTTOM, who displayed Anemones; by Mr. J. C. MARTIN, who had an attractive stand of Narcissi and Gladioli; by Messrs. ALLWOOD BROS., who showed Carnations, and by Messrs. HEWITT AND CO., Warwick, who exhibited very fine Delphiniums.

### Obituary.

J. A. NIX.—We regret to announce that Mr. John Ashburner Nix died on the 9th inst., following an operation, in a nursing home in London. He was the elder son of the well-known banker, Mr. John Hennings Nix, and brother of Major C. G. A. Nix, Chairman of the R.H.S. Fruit and Vegetable Committee. Mr. J. A. Nix was a big landowner in the county of Sussex, and had a fine garden at his residence, Tilgate, Crawley, where he was especially successful in the cultivation of indoor and outdoor fruits. He exhibited frequently, especially at the meetings of the Royal Horticultural Society, and his exhibits always won high awards. He also took a keen interest in afforestation. He interested himself in local work, and was at one time Chairman of the East Sussex County Council, and at the time of his death was Chairman of the Roads and Bridges Committee. The late Mr. Nix was not married; we understand that the estate passes to the family of Major C. G. A. Nix. Mr. E. Neal, gardener at Tilgate, contributed the weekly notes on the "Hardy Fruit Garden" to these pages in 1925.

### ANSWERS TO CORRESPONDENTS.

GREEN BEETLE ON RHUBARB.—L. H. The beetle is the common Tortoise Beetle (*Cassida viridis*), usually plentiful on Thistles, which appear to be its natural food plant. The larva is a little prickly-looking creature which constructs a sort of awning of its own excrement, and carries it about with it. There are eleven other species of the genus in Britain, and most of them are green; several are brown, and one of these (*C. nebulosa*) attacks Beet and other plants.

HYDRANGEAS WITH ANAEMIC-LOOKING LEAVES.—W. T. B. The Hydrangeas appear to have been potted in a compost deficient in iron. The same appearance may be brought about by too much lime or chalk in the soil; but it more often happens to be due to too much manure in the compost, as in the case of Roses. The leaves have not developed the chlorophyll or leaf-green in their tissues. By watering the plants once a week with a quarter-ounce of sulphate of iron to a gallon of water, we think you will get the leaves to turn green before the plants come into bloom. The treatment might have commenced earlier to advantage, because the plants are now far advanced. It would be well not to force them too quickly with fire-heat, but let them develop slowly, admitting air to the house judiciously.

RASPBERRY MOTH GRUBS.—A. P. The red grubs are the larvae of the Raspberry moth, which are boring their way to the pith of the canes, where they will pupate. The only thing to do at this stage is to cut off affected shoots and destroy the grubs. This is usually sufficient to keep the pest in check. In autumn the old canes should be cut out close to the ground and burnt, together with any old, cracked stakes for the larvae winter in such places and in the ground. If the attack is serious it would be worth while to try the effect of a soil fumigant during next winter.

	—Darwin, red ... 8 0-10 0
	—pink ... 8 0-10 0

REMARKS.—Prices of all Tulips are beginning to harden as supplies are getting shorter. Several boxes of these blooms have arrived in a very open condition during the last day or so, especially those from the Channel Islands and the West of England. The increased supplies of double white Narcissus have been greatly welcomed since Saturday last and prices for this flower are cheapening. Carnations are cheaper and supplies at present exceed the demand. Red Roses were somewhat shorter in supply to-day, but other varieties are as plentiful and cheap as last week. Spanish Irises are arriving in much larger quantities from home-growers, Holland and Guernsey. The newest subjects in this department are Coreopsis, Cornflowers and coloured Paeonies. Sweet Peas are much improved in quality and their prices are on the down grade. Supplies

of flowers from France have been affected by the warm weather; practically all blooms have suffered in transit and are almost useless on arrival in the market.

REMARKS.—A large amount of produce is being handled in the market just now, and with favourable weather there is some freedom in buying. Some choice English hothouse fruits are now available and selling well, such as Strawberries, Melons, Figs, Peaches and Grapes. Grapes Apples and Pears from South Africa and Australia are all selling satisfactorily. Oranges from Spain, Jaffa and California are a firm trade, and Grape Fruits and Lemons are an improved market. Some early Cherries from France are not particularly popular, being rather small, even for this time of the year. Tomatoes are arriving from the Lea Valley and Worthing districts in better quantities, and their prices are slightly easier. Cucumbers are in heavy supply and holding firm values. Forced Peas are a good trade. Forced Beans, however, are cheaper, this section being affected by the large quantities of French Asparagus available. English Asparagus is a poor trade just now, selling prices being entirely unsatisfactory from the producers' point of view. Mushrooms are rather more plentiful and cheaper. Gooseberries are variable in condition and price, some samples being affected with blight. New Potatoes are much cheaper, supplies being heavier from all sources. Green vegetables are a fair trade. Salads are keenly inquired for, and supplies are below requirements. Trade in old Potatoes is slow.

## GLASGOW.

A moderate amount of business was done in the cut flower market during the past week and prices remained at attractive levels. Outdoor Tulips were cheap at 1d. to 3d. per bunch, while Daffodils of the Emperor, Empress, Sir Watkin and Pheasant Eye varieties were worth 2/6 to 3/- per dozen. Prices of Carnations ranged from 2/- to 2/6, and for Roses from 2/- to 3/-. English Irises made 1/- to 1/6 for 12's, and Guernsey Irises, 3d. to 6d. for 6's. Richardias (Arum Lilies) averaged 2/6 per dozen; Lily-of-the-Valley, 2/- to 2/6; and Anemones, 4/- per dozen. White Spiraea sold at 6d. per pot; pink Spiraea, 9d.; and Hydrangeas, 1/- to 3/- each.

The improved weather had the effect of largely increasing deliveries of bedding plants, which realised the following

prices:—Coltess Gem Dahlias, 4/- per dozen; Chrysanthemums, 1/-; Lobelia, Daisies, Polyanthuses, Stocks and Asters, 1/- per box; Violas, 2/-; and Sweet Williams, 3d. Few changes were recorded in fruit values. Porto Rico Grape Fruits advanced to 26/- and 30/- per case, and Oranges were also dearer, Jaffas at 23/6, and Valencia, 300's and 240's, 21/- to 30/-. The value of American Apples and Cape fruits was unchanged.

In the vegetable market, Lettuces rose to 7/- and 8/- per crate; Cucumbers realised 4/- to 7/- per dozen; French Asparagus, 1/- to 1/2; Turnips and Carrots, 10d. per bunch; Radishes, 6d. to 1/- per dozen bunches; and Syboes, 4d. and 5d.

## TRADE NOTES.

We understand that the maintenance of the roof garden at May Fair Hotel, Berkeley Square, is in the hands of Messrs. Robert Green Ltd., of Crawford Street, W.1, who were also responsible for the floral decorations on the occasion of the visit of the King and Queen to the Hotel, and now carry out all the interior and exterior floral decorations there.

THE business of Messrs. Cooper, McDougall and Robertson, Ltd., has been converted into a public company, with a share capital of £1,800,000. This company combines the businesses formerly carried on by Messrs. Cooper and Nephews, Messrs. McDougall and Robertson, and Messrs. McDougall and Yalding, all of which acquired reputations for horticultural and agricultural insecticides, fungicides and weed killers. "Katakilla," a non-poisonous powder insecticide is a speciality of this combine. The head office of the company is at Berkhamsted, Hertfordshire; the Chairman is Sir Richard A. Cooper, Bt., and the Managing Director, Mr. Alexandra T. Robertson.

## THE WEATHER IN APRIL.

April was dry but windy, with westerly to north-westerly winds, the excess of westerly and shortage of easterly winds being remarkable. Trifling showers, however, were unusually frequent. The daily range of temperature was very small. After a fine, warm Easter holiday period, the month closed with a spell of cold, polar air. Visibility was excellent, and ozone abundant. The mean temperature of the entire month was 46½°, or not quite 10° above the average. There were 156 sunny hours, or 15 fewer than the normal. Rain fell on so many as 21 days—an unusual number for any spring month; but the total quantity was only 1.07 inch, or three-quarters-of-an-inch below the average. The amount of evaporation was considerable. There were two moderate gales from the sea. Ground frost was registered on five nights. Showers of hail fell on the 28th. Joseph Bazendell, The Fernley Observatory, Southport.

## GARDENING APPOINTMENTS.

Mr. P. Elliott for three years gardener to Lt.-Col. W. G. BOWYER, Weston Manor, Olney, Buckinghamshire, as gardener to B. R. HEATON, Esq., Round Down, Gomshall, Surrey. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

### SOMERSET COUNTY COUNCIL.

Appointment of HEAD GARDENER and INSTRUCTOR (Male), at The Somerset Farm Institute.

APPLICATIONS are invited for the above appointment from men who must have had a wide experience of general horticulture and especially in the cultivation of fruit and vegetables for market. Experience of teaching and lecturing is desirable.

The officer appointed will be required to work under the direction of the Horticultural Superintendent and to give practical gardening instruction to pupils, also to assist with class-room lectures and to deal with sales of produce.

Salary £165 per annum.

The appointment will be a designated post under the Local Government and Other Officers' Superannuation Act, 1922, and the person appointed must pass a medical examination.

Applications, which should be made on a form obtainable at the address below, and be accompanied by copies of not more than three recent testimonials, must be delivered not later than Friday, May 27th, 1927, to THE PRINCIPAL, Somerset Farm Institute, Cannington, Near Bridgwater.

### BECKENHAM URBAN DISTRICT COUNCIL.

#### GROUNDSMAN.

THE Beckenham Urban District Council invite applications from experienced Groundsmen for the post of ASSISTANT GROUNDSMAN in the Public Recreation Grounds. Wages £2 15s. 0d. per week. Preference will be given to a man with a knowledge of grafting and propagation of hardy shrubs. The successful candidate will be required to pass a medical examination and to contribute to the Superannuation Fund.

Applications, giving age and previous experience, and accompanied by copies of not more than three recent testimonials, to be addressed and delivered to the undersigned, not later than Saturday, May 21st, 1927.

F. W. GEDNEY,

Clerk to the Council.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## MUNICIPAL AND PUBLIC.

**A SITUATION** is required by an enthusiastic young **MAN**, in public or private service; sound practical knowledge of horticulture under glass and in the open; good technical training, and able to handle plants in quantity on modern lines; very methodical. Can you help?—M. P. S., Box 29, 5, Tavistock Street, Covent Garden, W.C.2.

**SANDERS, ORCHID GROWERS**, St. Albans.

**W.M. DUNCAN TUCKER and Sons**, Ltd., Lawrence Road, South Tottenham, N. 15. Conservatories, Winter Gardens, Vineries, Peach-houses. Portable Buildings, etc.

## FROM SEED

Few plants of present time grown from seed are likely to excite greater, if as much, interest, in the resulting flower as the **HYBRID LUPIN**. Despite its wonderful advance—its remarkable beauty and variety of colour—the possibility of obtaining other colours, or at least other colour combinations, is still very great, and certainly attractive. From a packet of seed of this invaluable earlier-than-June flower may quite likely emerge other gems. Seed of any of the 15 varieties of our beautiful **NORTHERN Strain**, 1/6 per pkt. Ask for descriptions.

**DICKSON & ROBINSON**,  
The King's Seedsmen, MANCHESTER.

Maincrop  
Potato  
Trials.

THE benefits conferred on horticulture by the unremitting efforts of those concerned commercially in the improvement of plants is rarely recognised, and yet more rarely acknowledged. Yet these benefits are manifest to every one who considers the large number of varieties of horticultural plants of economic value which are in existence. The numbers, indeed, suggest at times that the benefits are excessive, and that our gratitude in future may well prove to be not in direct, but in inverse ratio to the number of varieties. There are, of course, too many varieties of Potato, for instance, and we should all like to see some of them go to the limbo which receives discarded things. But to cavil of the plenitude of bounty is to expose a peevish mind, for it is only by trying all things that those which are good may be discovered. Furthermore, as shown by the recently published report of the trial of maincrop Potatoes carried out by the National Institute of Agricultural Botany\* there is more justifica-

tion than would at first sight appear for large numbers of varieties of economic plants. Commercial houses which have done so much in the way of raising and making available varieties which mature at different seasons—early, mid-season and late—have, as the result of these trials show, produced a well-nigh continuous series of forms, the members of which, even though they be put into one category, differ one from another in time of maturity. In other words, the groups into which Potato varieties are classified, early, second-early, and maincrop, are only convenient and not absolute. For instance, there are as large differences in time of maturity between extreme members of the maincrop group as there are between certain maincrop and certain second-early varieties. Thus in the report now under consideration, there were in the Ormskirk trial so many as twenty-five days between the maturing of the latest maincrop variety—in this case Kerr's Pink—and the earliest, namely, Ally. Majestic, on the other hand, took only a day longer to mature than did the precocious Ally, and Tinwald Perfection only about three days. The capriciousness of plants was, of course, amply illustrated in the trials, for, whereas Majestic was just in front of Tinwald Perfection at Ormskirk, it was four days behind the latter at Truro, whilst less than a day separated them at Kirton. The report illustrates also that profound horticultural truth that "what you lose on the swings you make up on the roundabouts," for the order of precocity is, albeit, completely inverted by the order of heaviness of yield. In all three trials Kerr's Pink, which was the latest of the Maincrop Potatoes, gave the heaviest yield. The battle—at all events the heavy-weight championship—is not to the swift, and Tinwald Perfection, so early in general, comes near the bottom of the yield list. Yet the incompatibility between earliness and yield is not absolute—nothing is in Nature—for Ally in the van of earliness occupies a middle rank in respect of yield. That excellent Potato—excellent for the epicure, if not for the market—Golden Wonder, is leisurely in development, requiring nearly a fortnight more to mature than does Ally, and is relatively light of yield, producing a mere nine-and-a-half tons per acre, as against the weighty behaviour of Kerr's Pink, which yielded at Ormskirk nearly fifteen tons. So there are Potatoes for all tastes and all times, and the grower may choose the variety which best suits his convenience—those which are ready early for lifting, those which give late but heavy crops, and those which are not very early and not very heavy, but the flavour of which is—so far as flavour goes in Potatoes—delectable. The final reflection which a perusal of this report evokes, is that now that science is doing such useful things for us, it should never forget that just as these were heroes before Agamemnon so there were able and successful discoverers before modern scientists were born, and that it was they who laid the foundations on which science is now industriously, and as time no doubt will prove, building successfully. The *Journal* contains some useful, if severe, reflections on the continued prevalence of misnomers of Potatoes, i.e., of old varieties receiving new names, and needless to say, such practices are much to be deprecated. But we would suggest that the way to extirpate the evil is the way of continuous propaganda. The reformer is too apt to remember the adage "anger hath its privileges," and to exemplify it in his own person, and is too apt to forget that ignorance and not naughtiness is responsible for most of the failings of

mankind. Therefore, the Potato Committee of the N.I.A.B. should be patient with us all, and keep on telling us with suave insistence rather than with acerbity all about the proper naming of varieties. The scientific intelligencia would not be less effectual if they were more patient.

**Kew Guild.**—The Annual General Meeting of the members of the Kew Guild will be held at the Clarendon Restaurant, The Broadway, Hammersmith, on Wednesday, May 25, at 6.15 p.m. The usual dinner will follow the annual meeting, when the President of the Guild, Mr. Walter Irving, will preside.

**Trials of Early-flowering and Single Chrysanthemums at Nantwich.**—Mr. W. E. Sherwell-Cooper, the Horticultural Superintendent to the Cheshire School of Agriculture, is organising a trial of Chrysanthemums to be held this year at Reaseheath, Nantwich. Early-flowering varieties introduced this year will constitute one trial and all the varieties tested last season and which were cut down by frost on October 15 before they flowered, will be grown again. New November- and December-flowering Single varieties will provide a third trial, while a special commercial trial will be conducted for the purpose of estimating the costs of disbudding as against undisbudded blooms, and comparing the resultant prices obtained by each method. The trials will be open to inspection in the autumn and should prove both interesting and useful.

**"Index Seminum" of the Paris Natural History Museum.**—A copy of the *Index Seminum* of the Paris Museum of Natural History has reached us, listing a very large number of species. At the end of the catalogue is a supplementary list of seeds gathered from wild plants in various localities, some in France, and some in French colonies and other foreign countries, including Chili, Mexico and Sweden.

**British Seedling Hydrangeas.**—The observation recently made in these pages to the effect that the seedling Hydrangeas raised by Mr. H. J. Jones and exhibited before the Royal Horticultural Society were the first raised in the United Kingdom from home-raised seeds, has been challenged. It appears that Mr. C. Stacey, of Chorley Wood Cedars, fertilised flowers of garden varieties of *H. hortensis*, saved seeds and raised seedlings about the same time as Mr. H. J. Jones (see p. 317), but Mr. T. Vallance, West Lodge, Greenfield House, Alloa, informs us that he raised a batch of seedlings many years ago, when at Cardean, Perthshire, and he has several of the plants in his possession now. He crossed La Perle with another French variety as at the time he "thought if a Frenchman could raise seedling Hydrangeas, why not a Briton?" It will be interesting to learn if any seedlings were raised prior to Mr. Vallance's successful attempt.

**Brussels Horticultural Congress.**—The Belgian Horticultural Congress is to be held at Brussels this year, at the Palais des Académies, on September 11. The subjects of discussion will number five, and will comprise the Social Role of Horticulture; Horticulture and the Economic Life of the Nation; Horticulture for Pleasure; Family Life in relation to Horticulture and Gardening; Horticultural Instruction, and the Relation of Science to Horticulture.

**South African Seed Export Trade.**—A conference of nurserymen and seedsmen from all parts of South Africa assembled at Port Elizabeth on Tuesday, April 12, under the presidency of Mr. C. Starke, and the visitors received a civic welcome from the Mayor of the City, Mr. Young. Mr. Starke, in the course of an address, stated that the export of seeds from South Africa was still very small, but capable of much increase. Business within the Union in the nursery and seed trade had been quite up to the average, and there were indications of an expansion. The small Maize crop harvested in South Africa

\* *Journal of the National Institute of Agricultural Botany*. No. 6, 1927.

during 1926 had, however, caused a restriction in farm business. On the other hand, the crop which was now almost ready for reaping was estimated by the Government Agricultural Department as likely to be the second largest produced in the Union. The exportable surplus of Lucerne seeds of the 1926 crop was very small, and what was once a very promising source of income to the Union farming community had dwindled very considerably during the past year, due almost entirely to two years of drought in the Lucerne-producing areas. The 1927 crop would also be small, and leave little for export, if any. The winter cereal crops had been fairly good. The demand for seeds, however, was not so brisk as could be desired, but it was still early in the season, and if good rains fell there would no doubt be a welcome improvement. Mr. Starke paid a generous tribute to the work of Dr. C. P. Lounsbury, the recently retired chief of the Entomology Division of the Government Department of Agriculture, and stated that the prospects of developing an export trade in South African-grown seeds to other parts of the Empire were at present being considered by the Department of Agriculture, and the Conference would be asked to give its views on the matter. If steady supplies of the right quality were available, he felt that South Africa, with some effort, could secure at least a portion of the Empire's trade, as the climate was very suitable for the production of seeds of high germinating quality, and the members of the Nurserymen and Seedsmen's Association could be of great assistance in fostering the production of good seed in South Africa. The Conference sittings were held in private.

#### Forthcoming French Horticultural Exhibitions.

—A horticultural exhibition is to be arranged at Nancy, from June 9 to June 13, in connection with the district agricultural competitions which are to take place at that period. From the 7th to the 13th of the same month, the local horticultural society is holding an exhibition at Angoulême, in commemoration of the fifty-years' jubilee of its foundation. At Troyes, an exhibition of Roses and other flowers is to be held on the 4th, 5th and 6th of June, and on the 12th, at Romilly-sur-Seine, a similar exhibition will take place. At Angiers, a general horticultural exhibition is to be arranged, to last from the 16th to the 26th of June, the local horticultural society and the Department of Maine-et-Loire combining in the management.

**French Cherries.**—French Cherry-growers are seriously concerned at the action of the English Government in prohibiting the importation of Cherries, unless accompanied by a certificate of freedom from the Cherry Fly, and many consultations have taken place between representatives of the two countries on the subject. A *modus vivendi* has now been established in the formation of a Syndicate which will represent the French Cherry growers, and will furnish a trade mark to its members for attachment to their consignments. This label will be accepted by the English authorities as evidence that the Cherries bearing it are clean, and the Syndicate will undertake not to issue the label to any but its own members, whose plantations will be rigidly controlled and inspected. This should prove a satisfactory method of dealing with what threatened to be a serious situation. The presence of the larva of the fly in the affected Cherries caused a set-back in the Cherry trade which injured not only the French exporters but also the English growers, as the public could not be expected to know which Cherries were French and which English, and played for safety by abstaining from buying Cherries at all.

**Iris Society's Outing.**—The members of the Iris Society have arranged an outing to the Iris trials in the Royal Horticultural Society's Gardens, Wisley, on Friday, June 3, the day following the Society's exhibition. A motor-coach will leave the Grosvenor Hotel, Victoria, at 10.15 a.m. and proceed to the Hut Hotel, Wisley, where lunch will be provided at 12 noon. The Wisley Gardens will be visited at 1.15 and

tea will be provided at the Hut Hotel at 4.30 p.m., the return journey being timed for 5.15 p.m. from the hotel. Further particulars may be obtained from the Hon. Secretary, Mr. G. N. Bunyard, Bower Mount, Maidstone.

**Burford Lodge Gardens.**—Sir William Lawrence will throw open his gardens at Burford, Dorking, on Whit Monday, June 6, from 11 a.m. to 1 p.m., and 2.30 to 7 p.m. A charge of one shilling will be made for admission, on behalf of the funds of the National Memorial to Queen Alexandra.

**Mr. George Yeld, V.M.H.**—We are glad to know that the valuable work which the veteran Mr. George Yeld has done in connection with Irises has received recognition from the Iris Society, which has selected him as the first English recipient of the Foster Memorial Plaque—a "special and personal award to anyone contributing to the advance of the genus." Mr. Yeld has continued his work in a quiet, unassuming manner, and produced

MR. GEORGE YELD, V.M.H.

some of the most beautiful garden Irises in cultivation, including Lord of June, which will always remain as a triumph of his skill. The Royal Horticultural Society awarded him the Victoria Medal of Honour in 1925. We take the opportunity to publish a portrait of this worthy gentleman, and offer him our heartiest congratulations on the honour bestowed upon him by his fellow workers and lovers of Irises.

**Chelsea Flower Show.**—The exhibition of the Royal Horticultural Society in the grounds of Chelsea Hospital, on May 25, 26 and 27, promises to be one of the finest and largest of the series, and only fine weather is needed to ensure success. An additional area has been secured this year to the right of the Monument (see, Fig. 172, p. 361), and will contain the special Orchid tent, the scientific and conference tent and the art tent, besides a refreshment marquee and space for sundries. The majority of the exhibits under canvas will be accommodated in two very large tents in the usual position. The pollarded Lime avenue will be utilised, as usual, for the display of sundries and adjoining the avenue will be the formal gardens, while the rock gardens will be in their usual place, by the Embankment road. The new arrangements to have the judging completed on the Tuesday will permit of the exhibition being completed and opened to the Fellows for a private inspection on the Wednesday morning, an innovation that is sure to be appreciated; the Fellows will have an opportunity of inspecting the exhibits from 9 a.m. until 12 noon, at which hour the general public will be admitted.

**National Park for Saskatchewan.**—Some 1,377 square miles of land has been set apart by the Canadian authorities in northern Saskatchewan as a National Park, to be known as the Prince Albert National Park. Its object is to preserve in perpetuity a section of the primitive forest and lake country, and to provide the people of the province, as well as those of other parts of the Dominion, with a great recreational area.

**Paris Municipal Gardens.**—The retirement of M. Forestier from his position as Conservator of the Western Section of the Paris Parks, (to which we refer elsewhere), and also that of M. Lefebvre, the Conservator of the Eastern Section, has led to a slight modification of the system which has hitherto prevailed, and the office is now in the hands of a Conservator General, M. Demorlaine, the Conservator of Waters and Forests, and Professor at the National Agronomical Institute.

**Visitors to Kew in 1926.**—The Editor of *Journal of the Kew Guild* writes to point out that the decreased attendance to the gardens in 1926 was not attributed in the *Journal* to the reimposition of the charge of 1d. for admission, and states that the cause was put down to the industrial crisis, lack of transport and other reasons directly due to the general strike of May, 1926. We agree that the strike may have been responsible to some extent, but consider the reimposition of the 1d. charge was the chief cause of decrease, for in the year 1922, when an admission fee was also in vogue and no industrial crisis, the attendance was even smaller than in 1926, the figures being 1,143,758 and 1,162,547 respectively.

**Moray and Nairn Foresters.**—The first summer outing of the Moray and Nairn Foresters' Society was held on the Seafeld estates forests, Grantown. In that area of the vast Seafeld property there are many thousands of acres of plantations, and the land is admirably adapted for natural regeneration. The party started with a tour of the few remaining old forests in Scotland of stately Scots Firs. The conductors of the tour, Messrs. Brown and Marshall, of the Seafeld estates, explained that the trees were lifted from Nethybridge and planted near Grantown 150 years ago. It was agreed that there were few such fine sights to be seen in this country. Proceeding down the slopes of the "regal, rolling Spey," as John Bright, the eminent statesman described the river, natural plantations were inspected and the methods of regeneration applied were explained. At Advie the party crossed the Spey and turned upward to another natural plantation and inspected the Forestry Commission's experimental thinning plots. Proceeding still higher, various plantations were found, indications of forests previously cut, in which sheep had once found grazing. This area has once again been replanted. At Nethybridge more experimental plots were seen, and a very fine plantation, twenty to forty years old. To the practical eye it was felt that all the plantations in this district were full of promise, and were likely, in the not far distant future, to uphold worthily the prestige of the famous Strathspey forests of bygone days. At the close of "a perfect day," the President, Mr. E. S. Grant, Altyre, in thanking the Seafeld Estate Trustees, expressed the indebtedness of the Society in being granted permission to visit the beautiful woodlands. He also expressed warm thanks to Messrs. Brown and Marshall for so kindly conducting them that day, with a special tribute to Mr. Brown for his hospitality.

**Retirement of M. Forestier.**—We learn that M. J. C. N. Forestier is retiring from the position of Conservator of the Parks and Gardens of Paris. Those of our readers who have visited Paris and enjoyed the pleasure of walking or driving in the many beautiful open spaces to the west of that city will be able to appreciate the skill and taste of the Curator, but it may not be within the recollection of all that M. Forestier was the creator of the public gardens at Bagatelle, with its Rosery and its collections of Nymphaeas and hardy plants. To his enterprise and energy is also due the organising each year of the international Rose contest at Bagatelle, which

has taken place since 1907. His talent for landscape gardening amounts to genius, and his services are everywhere in request; he has laid out gardens, not only in France, but in Spain, Portugal, Brazil, Havana, and other distant countries. He is the author of a monumental work entitled *Parcs et Jardins*, which had a wonderful success, but is now, unfortunately, out of print. Of a kind and friendly disposition, M. Forestier has made many firm friends in the course of his career. His retirement will seem, to those who know his vigour and energy to be unimpaired, a little premature; but there is no doubt that he will continue to serve the cause of horticulture, and perhaps be even more free to do so when he is able to devote himself entirely to landscape gardening, of which science he is one of the most brilliant exponents in the world.

**Cemetery Maintenance in Roumania.**—There are many cemeteries in Bucarest; they are of large extent, and in the past their management has proved a difficulty. The cemetery of Belo, the largest and most important, was formerly under the administration of the municipality, but much of the service necessary for planting, upkeep of graves, etc., was performed by private nurserymen, and the system left much to be desired. After several unsuccessful experiments, it was taken over with the other cemeteries by the Public Gardens authority, who appointed at Belo a head gardener of first-class skill and energy. The existing houses for the cultivation of bedding plants were increased by nine, and all were devoted solely to the cultivation of plants for the cemeteries, instead of being used, as hitherto, partly to supply the various parks. At each smaller cemetery a head gardener has been appointed, with a proper staff under him, among whom he divides the area to be maintained, and each gardener is responsible for the upkeep and neatness of his own portion of the cemetery. The graves are planted each spring with Pansies, Forget-me-nots, etc., according to the arrangement made with the owner of each grave, and are replaced at each succeeding season. The system is not without defects, and it is difficult to maintain a staff of men capable of carrying it out with the skill and intelligence necessary, but, on the whole, it seems to work better in Bucarest than the more common method of combining municipal ownership and control of the cemetery with private upkeep of each individual grave.

**Legacies to a Sundries Firm's Employees.**—The late Mr. William Longman Corry, Managing Director of Messrs. Corry and Co., Ltd., horticultural sundriesmen of Covent Garden and Shad Thames, London, left £100 to Mr. John Beale, office manager; £25 each to Mr. H. Collins and Mr. F. W. Vincent; £20 each to Mr. William Austin and Mr. William Davison; £10 to Mr. J. E. Denham, and £80 between other workers of five years' service. Mr. Corry left estate of the gross value of £23,633.

**Mr. W. Auton.**—The many friends of Mr. W. Auton will be pleased to learn that he has returned home from his visit to the West Indies in the best of health and after a successful trip. He covered a very extensive area, including British Guiana, Trinidad, Barbados, Grenada, St. Vincent, St. Lucia, Dominica, Guadeloupe, Martinique, Montserrat, Antigua, Costa Rica, Central America, Cuba and Jamaica. The object of his visit was propaganda work for the Adco process of making farmyard manure synthetically, and besides getting into personal touch with many planters on their estates, he gave lectures in many of the islands, all of which proved to be of great value to growers. Mr. Auton informs us that lack of organic manure is one of the problems of cultivators in those parts, and with the enormous growth of vegetation the soil is quickly depleted of organic matter, hence the need for constant renewal. There exists ample material for treatment, much of which in the past has been destroyed by burning, but with the use of Adco it is hoped to make full use of plant residues for manurial needs. The eagerness with which Mr. Auton was listened to everywhere

shows that the growers are alive to progress in modern agricultural methods, and anxious to give the scheme practical support.

**Appointments for the Ensuing Week.**—MONDAY, MAY 23: Harrogate and District Horticultural Association's meeting. WEDNESDAY, MAY 25: Royal Horticultural Society's Chelsea Show (three days); National Horticultural Society of France Centenary show (ten days). THURSDAY, MAY 26: Paisley Florists' Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Dahlias.*—As this is about the time when Dahlia orders are being executed by the "trade," we have thought it advisable to offer a few remarks respecting the successful treatment of plants thus supplied. Let us, therefore, suppose that a hamper of well-packed Dahlias has just come to hand, containing the numbers and varieties for which due instructions have been given, being the results of our scrutinising

carriage, it will doubtless be found that these young plants have been sent out in some two-inch pots, so that a speedy shift into a four-inch pot will not only be desirable but necessary, using good soil, and so drained that there may be but little need for at any time disturbing it; replace the plants in the frame, and keep close for a day or two longer, afterwards giving air by degrees, so as to insure robust growth. While all this is going on, look sharply after aphid or green-fly, to which, when detected, give no quarter. In this early stage of pot culture, promote by syringing and general attention to cleanliness a vigorous, rapid and robust growth; for with Dahlias, as with other plants, unless a good and sound foundation be secured, little success will attend the superstructure. We would rather shake out a plant, reduce the fibres, and repot into the same sized pot, than permit a plant to be pot-bound from which we hoped to derive good blooms; therefore, pot on up to planting-out time, rather than keep your stock short of root room.

FIG. 165.—STAPHYLEA COULOMBIERI.

R.H.S. Award of Merit, May 10. Flowers white. Shown by Lt.-Col. Messel, Nymans, Haywards Heath. (see p. 344).

observations last autumn. The plants will generally be found carefully tied to a small stick, with cotton wadding employed, to prevent injury from bruising. The pots will be mossed down and securely tied with bast matting, so that under the ordinary casualties of transit no serious damage may occur; yet how often have we found, that if one has been injured, it has curiously enough turned out to be a sort we most prized. In unpacking, be cautious not to expose the plants to the open air an instant longer than is actually necessary; let the operation be performed in your potting shed, forcing, or greenhouse; or, in the absence of these, in the dwelling-house rather than in the open air; and once freed from moss and ligatures, place them immediately in a close frame (if with a little bottom-heat, so much the better), and permit them to remain there for a day or two, until by their improved appearance all signs of confinement have disappeared. With a view to save weight and expense of

To constrain a plant in that way is to throw it into premature bloom; with ample pot room, stout plants are all but insured; as the time arrives for planting out, the necessary precaution as regards hardening off is, of course, a matter of routine on which we do not intend at present to enlarge, our object being merely to direct attention to the importance of treating young plants well before they are placed in the Dahlia quarter, to which we look forward with all those hopes and fears ever attendant on an exhibiting florist. *J. E., Gard. Chron., May 22, 1852.*

**Publications Received.**—*An Account of the Production and Sale of Grade A Tuberculin Tested Milk at the College Farm*; Department of Agriculture, University College of North Wales, Bangor; price 6d., post free.—*Festschrift der Österreichischen Gartenbau-Gesellschaft, 1827-1927*; by Dr. Gustav Klein and Fritz Kratochwilje. Julius Springer, 1, Schottengasse, Wien. Price 4.50 reichsmark.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Cymbidiums.**—The newer hybrids of Cymbidiums have flowers of rich colouring suitable for decorative purposes, either when growing on the plants or as cut blooms. They are plants of easy culture and do not require a high temperature. The majority of these Orchids flower during the spring, but many of the hybrids extend the season of blooming much later, and as the flowers last in good condition for a considerable time, they are desirable plants to grow for any purpose. There is no necessity to disturb the roots annually; repotting should only be done when the compost has become exhausted or the plants have outgrown their receptacles. If repotting is considered necessary it should be done soon after the flower scapes are removed, and those which produced their flowers early in the season should be attended to first. The roots are thick and fleshy, and produced freely in a suitable compost, therefore ample pot-room should be provided. The best time to repot Cymbidiums is just as the young growths are about to develop new roots from their bases, for the plants at that stage receive the least possible check from the disturbance.

**Compost.**—The rooting-medium for Cymbidiums should be of a retentive nature and may consist of equal parts of good, fibrous loam and half-decayed Oak leaves and Osmunda fibre, from which all the earthy particles have been removed, with sufficient broken crocks and silver sand added to render the compost open and porous. The thick, fleshy roots resent a saturated compost, therefore, the drainage material must be ample to allow water to pass away quickly. In repotting, every care should be taken not to break the roots, which should be disentangled, and all the loose, sour material removed. Such species as *C. Lowianum*, *C. insigne* and the many beautiful strong-growing hybrids of this class, are best grown in ordinary flower pots, whilst those with pendulous flower scapes, such as *C. Devonianum* and *C. tigrinum*, are best placed in pans and suspended from the roof-rafters. Some thirty species are known to science, the greater number of them being found wild at considerable altitudes, therefore an intermediate temperature is the most suitable for the majority of them, but the purely tropical species require a considerable amount of warmth.

**Treatment after Potting.**—The plants, when thoroughly established, require liberal supplies of water, and when moisture is applied care should be taken to soak the compost completely, which should be allowed to become moderately dry before renewing the application. Watering with weak liquid cow manure will greatly benefit the plants when they are well rooted, and in full growth. During hot weather the plants should be sprayed with clear water on frequent occasions to keep down attacks of red spider and other insect pests.

### THE KITCHEN GARDEN.

By R. H. CROOKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horley Hall, Gresford, N. Wales.

**Brussels Sprouts.**—Strong plants of Brussels Sprouts, which have been grown for the earliest supply, may now be planted in well-prepared ground. Choose an open situation, and tread the soil firmly. Dress the surface with soot, and well rake it in. Before lifting the plants from the nursery bed give the roots a good soaking with water. Lift them with a hand-fork and plant very firmly in rows three feet apart, allowing a distance of not less than thirty inches between the plants in the rows. When planting is finished, soak the roots again, and place a

small ridge of soot around the neck of each plant; the soot will not only act as a deterrent to slugs, but also prevent flies from laying their eggs at the base of the stem. Use the Dutch hoe freely throughout the season, as hoeing will do much to conserve the soil-moisture as well as assist the growth of the plants and keep down weeds.

**Carrot Fly.**—Where the Carrot fly is likely to be troublesome, preventive measures should be taken. Dry sand, mixed with paraffin and sprinkled between the rows will often have the desired effect. The application should be repeated so soon as the smell goes off. Paraffin emulsion or Quassia extract are other good preventives. Spray the foliage of the young plants with either of these specifics during the late evening, about every week or ten days. Frequent dustings with old soot will also be found useful in warding off the fly.

**Peas.**—The earliest varieties are in flower. Those growing on warm borders should be mulched, especially if the weather is dry, and the roots fed with liquid manure so soon as the pods have set. Use the Dutch hoe freely between the rows of later varieties and sprinkle the soil with superphosphate, the benefit of which will be seen later in the better filling of the pods. Apply a mulch in good time to all Peas growing on very light, shallow soils. Continue to sow for late crops until June 10.

**Cauliflowers.**—The heads of the earliest plants are forming, and at this stage the plants will be greatly benefited by liberal supplies of liquid manure at the roots. Should the weather be dry, mulching the roots with manure will be very beneficial to the plants.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NAIL-CAIN,  
Brockett Hall, Hertfordshire.

**Begonia nitida.**—*Begonia nitida* and its variety *alba*, are two useful plants for the intermediate house, and may be had in flower practically the whole year round. They are useful either as pot plants or for planting out, and training to pillars in a warm greenhouse. Well cultivated specimens will attain a height of four feet to five feet. The flowers have a pleasing perfume and are freely produced. Cuttings may be procured at the present time and inserted in an open compost in which they will root very quickly if placed in a warm propagating frame for a short time.

**Winter-flowering Begonias.**—Propagate varieties of the *Mrs. Heal*, *Optima* and *Exquisite* type from cuttings inserted in a light, open compost, when they are about three or four inches in length. Basal cuttings usually make the best plants and should, if possible, be selected, but sometimes these are not obtainable, in which case good results may be obtained from top growths, provided they are clean and free from mite. These Begonias root readily in a warm propagating case, but it is necessary to remove the light each morning to allow condensed moisture to dry up. When the cuttings are rooted, grow the plants on in an intermediate house.

**Dieffenbachia.**—Plants of *Dieffenbachia* that have grown tall and lost their lower leaves may be made into compact specimens again by the operation known as ringing. Have ready a quantity of moss and a small amount of sandy soil, so that the part where the stem is cut may be covered immediately. The plants should then be placed in a warm temperature and the moss kept moist until roots form. When it is seen that roots are penetrating through the moss, the tops may be removed from the parent plant, placed singly in small pots, and stood in a propagating frame for a short time. If the plants are shaded from bright sunshine they will soon become established in the new compost, and may then be removed and stood on a moist stage and grown on in a fairly high temperature. Leggy *Dracaenas* may be treated in a similar manner.

**Richardias.**—Arum Lilies that have been grown under cool conditions in pots have passed out of flower and may be stood in a sheltered position out-of-doors. If the plants are growing in borders it will be well to withhold water from the roots to some extent before lifting and placing them outside. The roots should be protected by a covering of soil and kept watered for a short time, when moisture may be withheld gradually to allow the plants a complete rest. Some growers plant *Richardias* in borders out-of-doors after they are sufficiently hardened and this method is suitable, provided the soil is favourable to them, then, when they are lifted again early in September, the roots will be in good condition for placing in large pots or in borders specially prepared for them.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDRE CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Figs.**—The earliest fruits in the first house, will now be ripe or approaching that stage, when the syringe should be used sparingly, especially on dark, dull days, when a free circulation of fresh air cannot be maintained. Syringing, however, cannot be dispensed with, as the fruits of the second crop, which are now well advanced, must be kept swelling by the aid of atmospheric moisture. Keep a sharp watch on the weather, and when it promises to be fine, syringe the trees copiously without wetting the ripening fruits, or immediately after the ripe fruits have been gathered. Syringing should be done cautiously in the afternoons, but the walls and floors may be well-damped with diluted liquid manure. As Figs revel in root moisture, the supply of tepid water and diluted liquid manure at the roots should be generous, and a temperature which suits Muscat Grapes should be maintained and regulated by day and night ventilation. As the first crop finishes, a few of the shoots may need stopping to divert the sap into the second crop, which may also need thinning. It is not, however, a good plan to pinch the shoots much in advance of the second crop, unless the growths are very strong.

**Melons.**—Early Melon plants, the fruits of which have been thinned to the requisite number, should be well-fed with warm, diluted liquid manure and syringed freely when the house is closed in the afternoons. Melons will benefit by very liberal watering from the time the fruits are the size of eggs, until they cease swelling, when the amount of moisture should be reduced gradually, otherwise the fruits will be liable to crack and be deficient in flavour. Plants in pots plunged to their rims in bottom-heat will require watering almost every day. Such plants should be top-dressed with loam mixed with bone meal, and watered occasionally with diluted liquid manure. When the fruits are well netted and colouring, the use of the syringe should be discontinued, but a brisk top and bottom heat, with a liberal circulation of air, should be maintained in the house.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Ornithogalum nutans.**—This bulbous plant in its quiet colouring of green and greyish-white, is a very charming plant for naturalising or for planting in large beds of shrubs. The plant increases freely by bulb division and is also easily raised from seeds. *Ornithogalum umbellatum* (Star of Bethlehem), although a much smaller-growing species, is very beautiful and useful for naturalising. Both plants are native of Europe, but are naturalised in several parts of Britain.

**Dwarf Cytisuses.**—Several dwarf *Cytisuses* are very useful for furnishing the rock garden or for covering dry, sloping banks. *Cytisus Beanii* gives a mass of yellow during the end of April and the beginning of May; its pungent fragrance in the hot sun is perceptible a long way off. *C. kewensis*, *C. decumbens*, *C. pilosa* and *C. Arduinii* are all excellent for the rock garden, and they may all be propagated from cuttings.

**Euphorbias.**—These plants are generally not regarded as being of much importance in the garden. There are, however, several species that are very showy during April and May. *E. Characias* and *E. Wulfenii* make large bushes of sub-shrubby character, and are very effective on large rockery slopes or in semi-wild parts of the garden. *E. palustris* and *E. epithymoides* are herbaceous species; their yellow bracts are very showy during the spring. *E. epithymoides* grows about twelve inches to fifteen inches high, and is very effective as a spring bedding plant; it may be increased by division or from seeds.

**Biennials.**—In the south, at least, May is somewhat early to sow the bulk of biennials, but those that require a long season of growth should be dealt with at this time. They include Sweet Williams, which may be sown out-of-doors, or in boxes in cold frames; I prefer sowing the seeds very thinly out-of-doors, as there is then much less risk of the plants being spoiled by overcrowding before they are transplanted. *Lupinus polyphyllus* should be sown thinly in lines out-of-doors, also Hollyhocks, which are best raised from seeds each year. If the weather is hot and dry it may be necessary to shade the soil by means of branches, until germination takes place. Polyanthuses, Aquilegias and other plants raised indoors earlier in the season should now be planted out in the reserve garden. Polyanthuses and other Primulas need a cool, rich, moist root-run and partial shade for at least a portion of the day.

**Rhododendrons and Azaleas.**—So soon as possible after they have finished flowering, these plants should have the old flowering trusses removed to prevent the formation of seeds. The development of seeds is a great strain on the plants, greatly restricting their growth and future flowering. Both Rhododendrons and Azaleas are benefited by an annual mulch of decayed leaves, but care is necessary in this respect, for if too thick air is excluded from the roots, while if piled too deeply around the stems it may seriously injure, or even cause the death of the plants.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD.  
Wrotham Park, Barnet, Middlesex.

**Fruit Prospects.**—In these gardens, there is a prospect of a good crop of Apples. The weather seems fairly settled and dry, so that the pollen has every chance to disperse and fertilise the blooms. Last year it was just the reverse; the cold, wet weather experienced during the flowering period not only washed away the pollen before it had time to fertilise the flowers, but the latter was kept in a wet, miserable state for days and without a particle of sunshine. Pears are, in many instances, setting freely, and the same is true of Sweet Cherries on walls; Morello Cherries are a perfect picture of flowers. Peaches promise to set a very fair crop. Strawberries have suffered more or less, many of the individual buds having been blackened, but several that are less forward seem to have escaped injury. Plums are not so promising, and I fear that the crop will be a light one.

**Disbudding.**—The growth of Peaches and other fruit trees is somewhat rapid, and the disbudding and removal of useless young shoots need constant attention. At the first operation, thin the growths sparingly to prevent a check to the tree; rather do the work on several occasions. Retain any shoots that are needed for furnishing the tree and for fruiting next year. Make sure of a good leader where there is room for extension, and retain suitably-placed shoots at intervals all over the trees for filling bare spaces.

**Sweet Cherries.**—Nearly all varieties of Sweet Cherries here, growing on west and east walls, are looking very promising for fruiting, but the fruits may turn yellow and drop later. Some amount of disbudding should be done, and shoots not required for extension may be stopped at the fourth or fifth leaf, but retain and train in those that are needed for extension

and for fruiting next season. Two-year-old shoots usually produce very fine fruits. Keep the foliage clean and free from insects by syringing the trees early and before aphids and other pests multiply. Quassia extract, Abol and XL All are all reliable insecticides. Do not overlook the needs of the roots; water them freely if necessary. Trees that have been planted late, or large trees recently lifted, should be kept shaded and syringed until the new roots have developed sufficiently to supply sufficient sap to the trees.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Cinerarias, Primulas, etc.**—Seeds of these indoor plants should now be sown in order to secure good specimens for next season's display.

ulas there is also a wide choice of variety and colour, and some of the named varieties of *P. sinensis* are exceptionally beautiful, but for general usefulness the stellata Primulas are invaluable, as they are easily grown and continue to throw up flowers over a long period. The Star Primulas may be obtained in white, pink, blue and crimson shades, which can be depended on to come true to colour from seed. *P. malacoides* is another very useful plant for furnishing the greenhouse in early spring, and recent improvements in this section include such fine varieties as Achievement and Advance. The ordinary *P. malacoides* is hardier than most people are aware, and may be grown quite satisfactorily in the rock garden, in the more favoured districts.

**Humea elegans.**—This old-fashioned plant is again being grown largely, and the present is the best time to sow the seeds. The seedlings

FIG. 166.—TULIP BRONZE WINGS.

R.H.S. Award of Merit, May 10. Flowers ruddy-bronze with golden-bronze shading. Shown by Sir Daniel Hall, Merton. (see p. 345).

They may be sown in any good compost, and where several varieties are grown, a six-inch pot will accommodate a large number in the early stages. Many beautiful forms of Cinerarias come remarkably true from seeds, and these are, to a certain extent, taking the place of the mixed packets formerly purchased, as they make it possible to grow the requisite number of plants of any particular shade that may be in demand. Among the blue forms there are several of intermediate habit, such as Reading Gem and Forget-me-not Blue, which, when associated in the greenhouse or conservatory with well-flowered plants of *Primula kewensis*, make a pleasing contrast. Where a reddish shade is appreciated, a good strain of the variety Matador may be recommended; the colours vary from brick-red to deep crimson, with many intervening art-shades of the greatest beauty. Among Prim-

need careful attention in their initial stages, as they are peculiarly liable to damp off, but if pricked out singly in thumb pots so soon as they are ready for transplanting, in a compost to which some old lime rubble has been freely added, and grown under cool conditions, they soon become established. Their future culture simply consists in repotting the plants from time to time as they require it, wintering them in five-inch or six-inch pots well-filled with roots, and finally transferring them in early spring to nine-inch or ten-inch pots, always supplying the requisite lime rubble at each repotting. Humeas grown in this manner may be employed as dot plants in the scheme of summer-bedding, or they may be used to decorate the conservatory during the summer and autumn, where their graceful, feathery plumes remain fresh for a long time.

## BULB GARDEN.

### RAISING LILIUMS FROM SEEDS.

I AM not convinced that I have found the best method of raising Liliiums from seeds, but I give my experiences in the hope they may prove helpful to amateurs. When I began to raise Liliiums from seeds I did so in the orthodox way. The seeds were sown in March, under glass, either in boxes or pans, filled with fibrous, loamy soil, and the young plants were, in due course, pricked out into a cold frame or, in the case of hardy, quick-growing species, into a sheltered position in the open. It did not take long to prove that this method was wrong. Liliiums, especially seedlings, resent disturbance, and the transplanting, I found, gave a check from which they took a long time to recover. It became evident that checks of this kind must be avoided. I am of the opinion, too, that the greenhouse is not the right place in which to raise hardy Liliiums.

There is, of course, the alternative method of sowing the seeds in small pots, and this practice certainly enables one to grow the plants on without interference, but where Liliiums are raised in large quantities it becomes a somewhat tedious process even if it were a good one. I have tried sowing the seeds in pots—little, square pots, made from peat, and when the plants were hardened off they were transferred, pot and all, to the garden. I have, however, discarded the use of such pots. It seemed, to begin with, to solve the problem of handling seedling Liliiums in a satisfactory way and avoiding disturbance of the little plants at a critical stage of their existence, but I found that the roots did not take kindly to the soil and were not inclined to leave their original peaty home. I found, moreover, that the peat tended to become sour and it did not decay in the soil. The result was that the plant contained in the receptacle made of that material soon became unhealthy.

Mr. J. Coutts, of Kew, has written that: 'Personally, I doubt if peat is necessary for Lilies, for there is nothing more poisonous when it gets into bad condition. I would rather advise the use of plenty of good leaf-soil, peat being safe only when it is well permeated with the roots of Rhododendrons and similar shrubs.' I fully agree and do not advise peat for the cultivation of Liliiums under any circumstances. I nearly lost a fine batch of *L. centifolium* through growing the seedlings in peat pots, and it was only by removing them therefrom in good time that the plants survived. The peat had become sour and poisonous.

I now sow all my Liliium seeds in the open ground. Last year, in April, for example, I sowed batches of *L. japonicum* (Krameri), *L. auratum* and its variety *platyphyllum*, *L. croceum*, *L. Parryi*, *L. regale*, *L. Willmottiae*, *L. sutchuenense*, *L. canadense*, *L. Davidii*, *L. Martagon album*, *L. M. Cattaniae*, *L. M. dalmaticum*, and several others in the open in a sheltered position, where drying winds in spring would not injuriously affect the young seedlings. *L. regale* was the only one to put in an appearance last year, but in March of this year a splendid crop of seedlings is the result. The only fault I have to find with this particular bed of seedling Lilies is that the seeds were sown too thickly. We experienced disastrous and almost unprecedented weather conditions during the closing days of April, but, fortunately, in anticipation of late frosts, I top-dressed the bed of seedlings with well-decayed leaf-mould and I do not think they have suffered any damage. The seedlings will not be disturbed until autumn. In late September they will be planted in their new quarters in the north.

In raising Liliiums from seeds, therefore, I think the best practice is to sow in the open. I have been doing so in April, but Mr. Coutts thinks I should do so in the autumn. I intend to try that plan this year, and I think it will mean the saving of a season. May is quite a good month in which to sow seeds, so that anyone who wishes to make a beginning has still ample time to do so.

A portion of the garden, that is fairly well sheltered from cold winds, should be selected for the sowing of the seeds. A dressing of well-

rotted cow manure (it must be old, thoroughly decayed material) should be put in six inches below the surface of the soil. It sounds heretical to advise the use of manure in the cultivation of Liliiums, but some time ago Mr. Grove advised me to try this, and I do not regret taking his advice. Manure certainly makes a wonderful difference to the roots and growth but it must be well-decayed. If manure in a proper condition is not available, well-decayed leaf-mould will afford a satisfactory substitute. Drills not more than half-an-inch in depth should be made for the seeds, and care should be taken to sow thinly. Keep the surface free from weeds, and if no seedlings put in an appearance this season there is no need for alarm. In spring, top-dress the bed with half-an-inch of leaf-mould or light soil, and allow the plants to grow on without disturbance for at least one season.

Some Liliiums are certain to show no growth until the following spring. *L. monadelphum* and its variety *Szovitzianum*, and *L. japonicum*, are notable examples. *L. auratum* and its variety *platyphyllum* also, in my experience, show no growth for a year when sown in the open. It has been said that seeds of *L. pomponium* germinate rapidly, and while this may be true of the form generally grown under this name, I find it is not the case with *L. pomponium vernum*. The seeds of this beautiful Lily show no growth for a whole year, and I am not writing of imported seeds but of home-saved seeds, sown in the following spring. In any case, the grower need not be astonished if he sees no results the first season. Let him wait until the following spring. I do not think that frost will harm the seeds. If the soil is well-drained there will be no trouble, but it is fatal to sow seeds in soil that is likely to become waterlogged. *George M. Taylor, Edinburgh.*

### LILIUM LONGIFLORUM VAR. SINENSE.

ON p. 314 you reported the receipt of blooms of a fine form of *L. longiflorum* to which the varietal name *sinense* had been attached on the ground that the bulbs had been collected (for the Yokohama Nursery Company) in an entirely new locality in Western China.

May I venture to suggest that it would be advisable to hold the varietal name in suspension till the details of its claim to stand have been verified. *L. longiflorum* has not yet been found in Western China, and the ascription of the variety in question to that country is possibly the result of an unintentional confusion between one end of China and the other.

A Lily seemingly closely akin to *L. longiflorum* has been sent from Eastern China (Hong-kong) to Yokohama and to the writer among others, but no specific identification of it seems to have been published. So much confusion has been caused, and students of the genus have been so hampered in the past by the incorrect geographical names bestowed on varieties as to justify a plea for the fullest investigation into the merits of new varieties before they are publicly launched. *L. longiflorum* var. *formosum* is a case in point, for it has not the remotest connection with Formosa. Another variety—*Harrisii*—has been equally wrongly named, for until an enterprising American nurseryman bestowed his name upon it, the variety had been known as *eximium*, still, as ever, its correct name. *A. Grove.*

## ALPINE GARDEN.

### SENECIO TYROLENSIS.

A FEW of the Groundsels are suitable for the rock garden, including the rare *Senecio tyrolensis*, which I was glad to see offered recently at a moderate price. The plant flowers in July and makes a bright patch in the rock garden with its six-inch-high stems carrying flowers of a most brilliant orange. The foliage, also, is decidedly attractive in its bright green colouring and its Fern-like form.

*S. tyrolensis* is not difficult of cultivation, but it needs a warm spot in the rock garden and, while lime may not be absolutely essential for its welfare, it may well be kept in mind that it comes from the limestone of the Tyrol, and

that it is always well to give consideration to a plant's preferences for or against lime as shown by its natural distribution. *S. Arnott.*

### ANDROSACE LAGGERI.

By some, this plant is regarded as a geographical form of *A. carnea*, and is listed as such in the *Kew Handlist of Rock Garden Plants*. Its native habitat is strictly confined to the Pyrenees between the altitudes of 1,800 and 2,400 metres. The plant forms close tufts of bright green foliage; the leaves are very narrow and decidedly more aciculate than those of *A. carnea*, while the glaucous appearance, which is a characteristic of this latter species, is absent.

The pale pink flowers are produced in March and April, and when they first expand they are sessile on the end of the shoots, but gradually the flower stem lengthens, and at the same time the pedicels of the flowers also, thus forming a tiny umbel of flowers on a short stem. When covered with flowers, *A. Lageri* is a very charming feature in the rock garden.

It succeeds in a compost containing an abundance of granite chips, and needs a dry, sunny situation. *T. H. Everett.*

## HARDY FLOWER BORDER.

### ANTHEMIS TINCTORIA KELWAYI.

THIS garden form of the indigenous *Chamomile* is worthy of a place in the hardy flower border; the golden-yellow, Marguerite-like flower-heads are abundantly produced from June to September, giving a most welcome patch of very bright colour over a long period.

It is extremely effective when associated with grey-foliaged or blue-flowered plants, and is, indeed, a first-rate border plant. This *Chamomile* grows well in any ordinary good soil and is most easily increased by division of the roots.

Another good form is the one known as *E. G. Buxton*. The comparatively little-known *A. Triumfettii* is a richly-coloured and desirable plant. There is also a white variety of *A. tinctoria* named *alba*, a cream form, *pallida*, and the lemon-yellow *sulphurea*.

These *Chamomiles* are excellent plants for the production of cut flowers. *A. E. R.*

## TREES AND SHRUBS.

### RHODODENDRON LEPTOTHRIUM.

THIS interesting Chinese *Rhododendron* belongs to the small group known as the *Ovatum* series, which also includes *R. Bachii*, *R. ellipticum*, *R. hongkongense*, *R. ovatum* and *R. Vialii*. The type of the series, *R. ovatum*, was discovered and introduced by Fortune in 1844, and is confined to the extreme east of China (Chepiang and Chusan). The plant introduced by Wilson from Hupeh in 1900 is *R. Bachii*.

*R. leptothrium*, which means "with thin leaves," is a native of North-west Yunnan. Forrest first collected it (No. 12,845F.) in open thickets on the Mekong-Yangtze divide, in July, 1914, at an altitude of 10,000 to 11,000 feet. In June, 1917, Forrest met with the species again (No. 13,881F.) on the Li-ti-ping, at an altitude of 11,000 feet.

Native bushes are described as varying from six feet to twenty feet in height. It is a freely-branched, evergreen shrub of bushy habit, with oval-lanceolate leaves, one-and-a-half inch to three inches long, and three-quarters to one inch wide in the centre, tapering to both ends; dark green on both surfaces. The deep rose-coloured flowers, with crimson spots or markings, are almost always borne singly in the axils of the leaves towards the ends of the shoots. An inch or more across, they are five-lobed, deeply cut, with five stamens and a large five-lobed calyx.

The subject of this note and Wilson's *Hupeh* plant, *R. Bachii*, are both flowering at the present time in the new Chinese *Rhododendron* House at Kew.

arranged if desired

The older processes of soil cultivation by horse and hand labour are being rapidly superseded by the more up-to-date methods afforded by motor power. Among the chief reasons which account for this important change are the perfect control and additional speed obtained by employing motor-propelled implements for soil tillage. A petrol-driven engine involves neither trouble nor expense during periods of unemployment, whereas a horse requires regular feeding and attention at all times. The 'Monotrac' is being demonstrated to progressive growers all over the country. It is fast becoming indispensable as the older methods are becoming obsolete. It will handle a large variety of tools such as—weed-ing hoes and sweeps, cultivating steels, furrowing and hilling tools and light ploughs. The tools are fitted on a drawbar which can be varied in width according to work required.

#### DAPHNE RETUSA.

THE comparatively new *Daphne retusa* (see Fig. 167), for which Sir William Lawrence received an Award of Merit at the Royal Horticultural Society's meeting on April 26, forms a small, densely-branched shrub, growing about two to three feet high, and produces clusters of flowers at the ends of the branches during early May. The species is a native of Western China, and was discovered by Mr. A. E. Pratt at 13,500 feet elevation; it was found by Wilson in the same place in 1901, and Wilson introduced it to the Coombe Wood nursery of Messrs. James Veitch and Son, where it flowered in 1909. Like those of most of the *Daphnes*, the flowers are very fragrant; they are whitish with rosy-purple tubes. The species has an affinity with *D. odora*, but differs in its much smaller, notched leaves and shaggy young shoots and flower stalks. *Daphne retusa* is illustrated in *The Botanical Magazine*, t. 8430.

#### ABIES PECTINATA.

(SEE SUPPLEMENTARY ILLUSTRATION).

IN some countries, Bosnia and Austria, giant Silver Firs have been met with two hundred feet high, but in Great Britain we have nothing so truly magnificent as this; 135 feet, or possibly 140 feet, seems to be their limit. There appear to be a few specimens of 130 feet, perhaps a few a little taller, and I daresay if the country was thoroughly searched, a goodly few would be found to measure about 120 feet. It takes a very tall looking tree to exceed a carefully measured height of over a hundred feet.

So far—I am only referring to trees planted in goodly numbers—the Silver Fir reigns supreme in height amongst competing contemporaries, but in tree life, as in other walks of life, the giant of one day may wake up to find itself relegated to the ranks of the mediocrities.

The common Silver Fir (see Supplementary Plate) was introduced to Great Britain in 1603. It probably takes about 150 years to arrive at full growth and it has had plenty of time to do this, and very well has it come through the ordeal. Let it, however, take warning from the almost invariable fate of the record holders. There is the British Columbian *Abies grandis*, a tree that is said to reach a height of 300 feet on the coast line of America. It only arrived here in 1850, but by its appearance and the rate of its growth, it looks as though it fully intends to live up to its title of the Giant Fir of the West. Then there are other candidates for fame, i.e., trees introduced almost at the same time, the middle of the last century, namely, *Sequoia gigantea* and *S. sempervirens*, both of Cycloplan magnitude. Both have attained heights of over 300 feet in their own countries, and the big Wellingtonia of the Mariposa Grove, through which many of us have driven in a coach and four, measures—if I remember aright—thirty-three yards round. Perhaps it is hardly fair to drag these Sequoias into the question, since a bountiful nature has assigned to them as an allotted span an average life of 1,500 years.

Besides these rather abnormal monsters of tree life, some of the new Chinese Conifers, at present only a few feet high and fifteen or so years of age, look as though they may out-tower their Anglicised cousin, *A. pectinata*. *A. Forrestii* looks like making a big tree by its precocious rate of growth; that is to say, if it escapes the ravages of the *Agaricus melleus*.

While the Birch tree is accredited with the title of Lady of the Woods, the Silver Fir, though it may be here and there overtopped by an unusually well-grown Douglas Fir or Sitka Spruce, has certainly been accorded the dignity of Colossus of our Forests.

The leaves and other characteristics of this well-known tree call for but few words. *Abies pectinata* belongs to a group of a section of Silver Firs that affect the courtesy title and description of truly pectinate; that is to say, the leaves are arranged after the manner of

the teeth of a comb, and are supposed to display a flat and horizontal effect. There is one little reservation with regard to this well-known description of them that may not be so universally known, and to which I will make brief reference. For the most part, those interested in these sort of identifying processes, learn their lesson, and bestow their attention upon the leaves of the branches within their reach. The leaves on the top, however, do not, in this case, live up to the reputation of the leaves on the lower branches, and at times vary most perplexingly and confusedly.

Once, here, a well-remembered gale, on Boxing Day, 1915, brought crashing to earth, in the short space of twenty minutes time and the narrow space of an acre in extent, some forty or fifty well-grown trees. Amongst the victims was a group of seven large Silver Firs, which the Royal Agricultural Society's England Plantation Competition judges reckoned to be the largest timber-containing group of the sort they had ever seen, although one member stated he had seen larger individual trees. The average height of the seven turned out to be between ninety-five feet and ninety-six feet; the highest was 109 feet. They registered an average

prices for them that our commercial mind<sup>s</sup> yearn for. Nor, am I afraid, are the converted planks sought after so much as some. Their place seems in the approbation of market values, to be between those of the Scots Pine and the Spruce. Although the wood is reckoned to come out well under watery experiences, they are, to put it briefly, preferred as boards rather for indoor than outdoor work.

The cones pass through three colour stages; at first green, then red, ultimately brown. They grow, for the most part, on the high branches, approachable enough for monkeys, chipmunks and squirrels to be on intimate terms with, but difficult for man to obtain. The cone collector, too, has to bear in mind the warning motto, *carpe diem*, for, suddenly, when ripe, they dehisce and scatter their contents to the four winds of heaven. So well-known is the Silver Fir that it is hard to write anything new about it, or even to present what is so well-known in a novel manner.

In bidding good-bye to this subject, I would add that these trees have been very good friends to our landscape scenes, and quite good friends to our estate works. Chas. Colman Rogers, Stanage Park, Radnorshire.

FIG. 167.—DAPHNE RETUSA.

R.H.S. Award of Merit, April 26. Flowers white, shaded with purple. Shown by Sir William Lawrence, Bart., Burford, Dorking.

measurement of 274 cubic feet. But why lament over these dead heroes! The only consolation it gave to observers was a chance of comparing the leaves on the top of the tree with those below. Those on the top displayed a more radial arrangement, such as *A. cephalonica*, *A. pinsapo* and the new Chinese *A. recurvata*, all of which have been accorded the honor of a separate botanical section. Also they were shorter and stiffer than those below, and inclined to be pointed at the apex instead of orthodoxically rounded and notched, as well as unorthodoxically radially instead of horizontally and pectinately arranged.

The worst of these extra big trees is, when the Fates and the Furies uproot them and hurl them to earth, they are very difficult problems to deal with. They call for "all the King's horses and all the King's men," or more, literally, all the best tackle and power to take them to a place of execution. Hence it is that even timber dealers evince rather a languid desire to cope with them; and, worse still, to pay those

#### EXOCHORDA WILSONII.

THIS plant, which is of comparatively recent introduction, is a very beautiful subject for a sunny situation, either in the shrub border, or as an isolated specimen on the grass. Like *E. macrantha*, it is a very striking plant and an excellent subject for training against a south or west wall.

The pearl-like buds expand into blossoms of snowy white, and are fairly persistent; the flowers are, I think, even more beautiful in the bud stage than when fully expanded, a peculiar grey sheen greatly adding to their attractiveness. The flowers are faintly but pleasingly fragrant.

The foliage of this deciduous shrub is of a light and pleasing green, in pleasing contrast to the white flowers; the flowering season is early May.

*E. Wilsonii* is not fastidious as to soil and will grow satisfactorily in well-drained loam. Ralph E. Arnold.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early "in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand" or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents should obtrude delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## IDEAL GARDENS AND PLANT LORE.

### I.—A GARDEN OF ADONIS-FLOWERS.

(Concluded from page 266.)

TO resume our study of the flowers relating to Adonis, I take next the *Flos Adonis*. The name Adonis-Flower, by which that of *Flos Adonis* is translated, was applied by Linnaeus to the Pheasant's Eye (*Adonis autumnalis*). The name occurs in Merrett's *Pinax* of 1667. The Germans, however, prefer to give the name of Little Blood-drops or *Blüts-Tröpfchen* to another species of the same genus (*A. aestivialis*), known as the Summer Adonis-flower. This is the plant which, as Sibthorp has shown, grows wild in Greece, as it does also in Germany and Italy. In Palestine, likewise, there are numbers of plants belonging to this genus, and as Syria is the home of the Adonis legend, the Pheasant's Eye has a strong claim for admission into our Garden of Adonis.

On referring to my *Flowers and Flower Lore*, published in 1884, I find the following:—

"Bion, in his epitaph on Adonis, represents the Rose as springing from the blood of that god, as the Anemone sprang from the tears shed over him by Venus. This, in Archdeacon Hare's opinion, led to the German application of the name Adonis-blume, or Adonis' flower, sometimes to the Anemone, sometimes to the Red Chamomile, which somewhat resembles the Anemone, and might easily be supposed to be sprinkled or tinted with blood."

Turning again to the Venerable Archdeacon's notes, I find that he gives us no clue to the botanical name of the plant, which he speaks of as the Red Chamomile. It may, however, be traced to our ever-helpful friend, Gerarde, who has the following note in Chapter 80 of his *Herbal*, entitled, "Of Adonis Floure," of which he describes two forms. "The first (he states) hath very many slender weake stalkes, trailing or leaning to the ground, set on everie part with fine, jagged leaves, very deeply cut like those of Camomill, or rather those of May-weed, upon which stalkes do grow small red flowers, in shape like a field Crowfoot, with a blackish greene pointell in the middle, which being growne to maturitie turneth into a small greenish

bunch of seeds, in shape like a little bunch of Grapes. The root is small and threddie. The second differeth not from the precedent in any one point, but in the colour of the floures, which are of a perfect yellow colour, wherein consisteth the difference."

He then proceeds to discuss the names. "Adonis floure is called in Latin *Flos Adonis* and *Adonidis*; of the Dutchman (i.e., by the Germans) *Feldroszlin*; in English we may call it *Red Maythes*, by which name it is called of them that dwell where it groweth naturally, and generally *Red Camomill*. Our London women doe call it *Rose-a-rubie*." Many of the species have yellow blossoms, so that the two we have mentioned make the loudest call because their flowers are red.

As an illustration of the confusion which may result from the popular use of names unaccompanied by the botanical term, it may be noted that Lyte speaks of the autumnal Pheasant's Eye (*Adonis autumnalis*) as the Purple Chamomile, a name which we find in Turner applied to the Starwort (*Aster Tripolium*, L.).

### THE RED ROSE.

With how many legends relating to war and bloodshed the red Rose is associated it would be impossible to say; but certainly this favourite flower is inseparably connected with Adonis and Venus or Aphrodite. One version has it that the Rose sprang from the blood of Adonis, while the Anemone or Wind-flower arose where the tears of the goddess fell.

"But gentle flowers are born and bloom around

From every drop that falls upon the ground.  
Where streams his blood, there blushing springs the Rose,  
And where a tear has dropped a Wind-flower blows."

Moschus, Bion in these lines, and other poets tell us either that the Rose sprang from the blood of Adonis, or that its white petals were changed to red thereby. From Catullus we learn that the Rose is red from blushing for the wound which it produced when the goddess trod on its thorns in hastening to save her lover.

"Her step she fixes on the cruel thorns;  
And with her blood the pallid Rose adorns."

But there is so much of a similar nature in the plant-lore of Greece and Rome that we must hasten to our next subject:—

### THE POMEGRANATE.

It is Ovid who teaches us that the Pomegranate must have a place in our Garden of Adonis.

"Short time ensued till where the blood was shed

A flower began to rear its purple head;  
Such as on Punic Apples is revealed,  
Or in the filmy rind but half concealed."

With the latter allusion we may compare the references to the Pomegranate in the *Song of Solomon*. Some authors use this plant, named Rimmon by the Hebrews, to illustrate a closely related story, and as both legends refer to the neighbourhood of Damascus, Adonis and Agdestis may have been confused the one with the other, as we shall see later under the Almond. Referring to the latter, a German writer on the mythology of plants says that "aus seinem Blute entspross der Granatbaum mit seinem schönen Früchten." This plant fills a large place in the folk-lore of many lands, and as we stand by its side in our Adonis Garden we shall find it instructive to read and study some of the many legends placed on record.

### SANTOLINA.

Much confusion exists in reference to this, as with the Adonis-flower already named. The reason is that botanical terms are translated into popular language in different ways, and that one every-day name is frequently applied to different plants. Among the Compositae we find a genus of plants which bears the name *Santolina*. Literally translated this would be the Sacred Flax, but with the true Flax it has no

connection. In some works the English name for it is Lavender Cotton, and the plants possess qualities similar to those of the Tansy and Wormwood. Pliny and Theophrastus speak of *Santolina* in connection with the Gardens of Adonis, and it is probable that the plant was one of those which the ancients used in their rites relating to this popular diety. *Santolina incana* is sometimes spoken of as Silver Lavender. The brilliant crimson or Scarlet Flax which is so popular to-day in the gardens of Rome and other Italian cities would be a very appropriate plant to bear the name of Sacred Flax, if we are to confine ourselves to blood-coloured blossoms; but I do not find that this has ever been admitted into the list of Adonis flowers.

Another plant which has been named in this connection is

### THE LARKSPUR;

on the ground that this was the flower which the poets intended when they spoke of the Hyacinth. Here, once more we are in the midst of confusion. The Hyacinth is linked on to a legend similar to that of Adonis, and has a wealth of poetry and mythological lore associated with it which cannot here be recorded. We endorse the words of Miss Kent, however, when, discussing the question of Adonis flowers, she states that there are, in addition to the Pheasant's Eye, "other flowers which lay claim to this illustrious origin; the Larkspur is one," but the claim is not so strong as in many other cases. Since we wish our garden to contain every plant which can be related in any way to Adonis, we shall admit the Larkspur to a place, all the more readily because it has of recent years been brought to the highest state of perfection.

### THE VERNAL ADONIS.

The allusion to Miss Kent, and her instructive *Flora Domestica*, recalls the fact that she mentions this also under the name *Hellebore d'Hippocrate*, as well as the Apennine Adonis and a shrub Adonis which is a native of the Cape of Good Hope. These, however, would only find a place here, because they belong to the genus Adonis, and not on account of their history, colour or legendary associations. To Shakespeare, however, we are indebted for the addition of

### THE VIOLET.

In "Venus and Adonis" the bereaved goddess is represented as reproaching Death for having robbed her of her beloved, so full of beauty and sweetness that he imparted these to the Rose and Violet.

"What dost thou mean  
To stifle beauty and to steal his breath,  
Who when he lived, his breath and beauty set  
Gloss on the Rose, smell to the Violet."

That is surely one of the most graceful tributes to Adonis that has ever fallen from a poet's pen, and thanks are due to our great dramatist for enabling us in this way to enrich our little garden plot. Nor must we overlook our further debt to Gerarde, who enables us to add yet another plant to our list.

### THE Hibiscus.

The Changeable Rose (*Hibiscus mutabilis*) is well-known, but there is another species named by some the Venice Mallow, by others Mallow of an Hour, or Good-night at Noon. Gerarde remarks that it should rather be Good-night at Nine; "for this beautiful flower opens at eight in the morning, and having received the beams of the sun, closes again at nine." He then adds:

"Ovid, in speaking of the Adonis-flower, is thought to describe the Anemone, or Wind-flower, which we rather deem to be this quick-fading Mallow; for it is evident that Adonis-flower, and all under the title of Wind-flower, last more than one day; but this is so frail that it scarcely lasts an hour. . . . Doubtless, the plant was mistaken by the poet, considering the fragility of the flower, and the matter whereof it sprang."

## THE CISTUS, OR ROCK-ROSE.

It must be noticed, however, that another flower, the *Cistus*, is held by some to be the flower which best accords with the fugacious bloom introduced by Ovid along with the Pomegranate in his story of the metamorphosis. The blossoms of some of the Rock-Roses would certainly suggest that they had an origin such as we have been considering, and we therefore welcome the red varieties as graceful additions to our list.\*

## THE IRIS.

Owing to the confusion already mentioned in connection with epithets applied to flowers in the Greek and other languages, the *Iris* has come to be regarded by some as a competitor for a place among the flowers of Adonis. It is not unworthy of such a place, and since the ancients often spoke of purple blood, the purple *Iris* might well have been stained therewith; but, like the Larkspur, its claim is weak.

One more allusion, and our list must close. In the Lateran Museum at Rome is an ancient sarcophagus on which is a representation in sculpture relief of the parting of Adonis from Aphrodite. Adonis is shown reclining in the lap of the goddess and holding in his hand the branch of a tree. What does this represent? Some think the Willow, others the Mistletoe. I would put in a plea for

## THE ALMOND.

The idea has been put forth that we have here a suggestion that by means of the magic bough the departing god may yet again be brought back from the shades of the departed to a land of life and love. But an Almond tree is said to have sprung from the blood of Agdistis, and since (as already seen) this god and Adonis are frequently confused with each other, and the Almond blossoms are red, we think this a much more appropriate tree to supply the branch which Adonis holds.

Our group of plants forms a pleasing array. I picture our Garden of Adonis in the springtide or early summer, when the Anemone, Argemone and Adonis-flower or Pheasant's Eye are in bloom and the Almond tree flourishes, or the Rock-rose, Mallow, Flax, *Iris*, Larkspur, Violet and Rose are flowering and giving forth their fragrance, and regret that I cannot have such a parterre, crowned with a statue of the god, really under my own direction. There must be many, however, who can carry out the plan, and to these it will be a joy to make further suggestions in the papers which are to follow. *Hilderic Friend.*

## A NEW FORAGE PLANT.

VARIATIONS in the more important farm plants were observed and recorded more than a century ago, and during the last century great improvement was brought about in these crops by the selection and development of the best types. Such a high level has now been reached that further advance, either as a result of selection or hybridisation, is very difficult to achieve.

Less attention has been bestowed on the forage crops which, owing to the trend towards animal husbandry in these islands promise to overtake the cereal crops in importance.

At the present time there is no Leguminous forage crop which will take the place of Lucerne, as grown on a large scale in many countries, but several native species just fall short of providing the necessary qualities. Such a plant is Sweet Clover. This was apparently cultivated in England as early as the sixteenth century, but was displaced by Red Clover on the introduction to cultivation of that useful crop.

The crop to which this note refers belongs to this family of plants and is probably a sport of the common commercial Sweet Clover (*Melilotus alba*). Botanically, it most closely resembles *Melilotus arvensis* which, however, in its wild state, is a small plant, often reaching

\* Since this was written I have seen the large red *Cistus* extending for miles in the Western Riviera. H. F.

no more than a few inches in height, and is normally an annual or biennial. The new plant differs considerably in appearance and character from the various types of Sweet Clover met with in this country. It is a perennial in the sense that Lucerne and Sainfoin are perennials, but has no power to renew its root-system as is the case of the grasses and White Clover; persistence depends on the survival of the original root and its duration is influenced by the treatment the plant receives.

The plant grows to a height of four feet and does not commence flowering until over two feet high; it is very bulky and carries a high percentage of leaf, flourishes equally well on all classes

spite of its superior feeding value the area under this crop is shrinking.

White Clover, the best of pasture plants, gives but a small yield; therefore, a grazing plant of the same general composition combined with productiveness gives promise of usefulness. There can be little doubt that British agriculture would at the present time benefit from an extension of the use of Leguminous crops, and with the development of stock-farming forage crops of this class are sure to be needed to a greater extent than at present. Corn has become unprofitable on many farms and the persistent fall in the price of animal products compels the farmer to seek the most

FIG. 168.—RHODODENDRON LEPTOTHRIUM.

(see p. 352.)

of cultivated soils and the forage is free from the objectionable woodiness of the common Sweet Clovers. It makes a leafy, green, aromatic hay, and, dried or green, is readily eaten by all classes of farm stock, even in the later stages of its growth. Sheep are particularly fond of it. The agricultural qualities of the plant approximate closely to those of Lucerne, and interest in the crop lies in the possibility of its ability to replace Lucerne or Red Clover where those crops do not give satisfactory results, and of extending the area under Leguminous grazing and hay. Over a large area Red Clover cannot be grown with success more frequently on the same land than once in eight years, and the available substitutes fall far below it in yield and value, while the soils in which Lucerne will thrive are very limited in extent, and in

economical methods of providing for the needs of his live-stock.

Leguminous forage, when cut early and well harvested, has a composition mid-way between that of the rough fodder of the farm and the concentrates, and so can be made to bring about a considerable saving in the cost of feeding. At the present time comparatively little pure Legume hay is grown in this country, Vetches and Peas being the only crops which can be relied on under all soil conditions; although these crops are well suited to the purpose, the annual seeding and cultivations add considerably to the cost of this crop as compared with such crops as Lucerne and Sainfoin which need seeding only at intervals of several years. *Jas. C. Brown, late Vice-Principal Harper Adams, Agricultural College.*

## THE GLADIOLUS.

I do not propose to give a lengthy or scientific account of this flower, but merely to bring together in so small a compass as possible any particulars and incidents in the story of the Gladiolus that I can remember which may be of interest to the many rather than to the few.

Full descriptive details of the genus and its numerous species will be found in several good works on horticulture; for instance, the *Illustrated Dictionary of Gardening*, edited by the late Mr. George Nicholson, and Mr. A. J. Macself's *Gladioli*.

There are some fifty to sixty species. Of these perhaps less than a dozen are well known, and hardly any really popular. The majority hail from South Africa, others from the Mediterranean, Central Europe and Asia Minor. Most are graceful and decorative and many are hardy and easily grown. The first comer was *G. tristis*, in the year 1745. But the popularity of the Gladiolus is entirely due to hybrid varieties which have been raised in France and England by artificial means.

The early-flowering dwarf types are largely used for the production of flowers for market, and are, for example: *G. insignis*, *G. The Bride*, a variety of *G. Colvillei*, itself a hybrid between *G. cardinalis* and *G. tristis*; *G. ramosus*, a hybrid between *G. cardinalis* and *G. oppositiflorus*; with many varietal improvements, such as *Peach Blossom*, *Blushing Bride*, *Non Plus Ultra*, *Queen Wilhelmina*, *Fairy Queen* and *Fire King*. They are largely cultivated commercially in the Channel Islands and also in England under glass by market growers. These form a group by themselves, spoken of frequently as the *nanus* class, and are of more interest to florists than to the private grower, although they are useful for conservatories and warm borders.

What I am writing about, however, are the later-flowering, larger, taller kinds, now at long last so widely grown in private gardens. They belong to the following sections, given in the order of date of introduction. But there has recently been much blending of the sections.

- 1.—*Gandavensis*: *G. psittacinus* × *G. cardinalis* or more probably *G. oppositiflorus*.
- 2.—*Lemoinei* or *Spotted Butterfly* or hybrids: *Gandavensis* × *G. purpureo auratus*.
- 3.—*Nanceianus*: *G. Saundersi* × *Lemoinei*.
- 4.—*Kelwayi*: *Gandavensis* × *Nanceianus*.
- 5.—*Childsi*: *Gandavensis* × *G. Saundersii*.
- 6.—*Langprim*: *G. primulinus* × *Kelwayi*, *Gandavensis* and other large-flowered hybrids; *Primulinus* hybrids: *G. primulinus* × small-flowered kinds, e.g., *Lemoinei*.

1.—The important *Gandavensis* class originated before the year 1841 with Van Houtte, nurseryman of Ghent, Belgium, or it may be that the raiser was one Bedinghaus, and Van Houtte the distributor.

Souchet, gardener at Fontainebleau, France, soon commenced raising improved varieties, and his work was carried further, after his death in 1872, by Souillard and Brunelet, his successors in business. Messrs. Vilmorin and Andrieux, of Paris, distributed the Fontainebleau seedlings and still do so. James Kelway, of Langport, first imported into England some of these hybrids so long ago certainly as 1847, and exhibited them and his own seedling varieties in London and elsewhere from about the year 1852 to the time of his death in 1899.

In 1860, Standish, a nurseryman of Bagshot, exhibited in London a variety called *Mrs. Blount* and another called *Herr Rosenberg*. Each received a Certificate of Commendation. In the year 1866, James Kelway was awarded no fewer than twenty-seven certificates for new varieties of his raising, and was cataloguing hundreds of varieties. Between this date and 1893 about 170 new varieties were certificated by the Royal Horticultural Society, the principal exhibitors and raisers during that period being Messrs. Kelway and Son. Other exhibitors were Samuel Dobree, an amateur of Wellington, Somerset; Messrs. Campbell, nurserymen of Gourrock, Scotland; Messrs. Galloway, nurserymen in Scotland; and Mr. John Burrell, nurseryman

of Cambridge. A well-known connoisseur and writer, the Rev. H. D'Ombrain, wrote in 1901:—

"The history of the flower during that period has certainly been a remarkable one, and unlike that of any other flower, for its production has been confined to very few growers. In France, one may say positively no other florist has ventured to enter into competition with the Fontainebleau firm. Some years ago there were a few who ventured to do so, but they did not produce any flowers of any great merit."

As far as our English growers are concerned the production of new varieties has been almost restricted to one or two growers. For a very great many years, Messrs. Kelway and Son, of Langport, Somerset, held the field, and for some time used to contribute to the autumn show held at the Crystal Palace, where I regularly attended, and saw from year to year the wonderful improvement that had taken place in the production of new varieties. One great object which the raisers had in view was to produce spikes whose flowers should face the visitor, and not be back to back, as it was felt that this was a great defect. After some years a very formidable competitor, to Messrs. Kelway arose in the person of Mr. John Burrell, Howe House Nurseries, Cambridge." *James Kelway.*

(To be continued.)

## GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

THE torments of Tantalus can have been but a trivial annoyance compared with those lying in wait for the Rhododendron enthusiast. Here, in the north-west, we escaped the frost whereof we heard in other parts of the realm in April, and were chortling complacently over our immunity, for *on suppose tranquillement les malheurs d'autrui*; but we found ourselves up against it in the last night of the month and the first night of May, when the mercury registered 8° of frost. Blue clouds of *R. Augustinii*, rosy flush of *R. Schlippenbachii*, sulphur tresses of *R. campylocarpum*—all were blistered into dingy ashes. But that was not the worst of it. The serious matter was the ruin wrought upon the young growth of many fine species, wrecking the prospect of next year's display.

Still, the mischief has not been so bad as it was last year, when the frost came a fortnight later—on May 15 and 16—and growth was further advanced. Among the newer species that have escaped damage may be noted *R. Souliei*, *R. adenogynum*, *R. Wiltonii*, *R. Prattii*, *R. Fargesii*, *R. glischrum*, *R. pachytrichum*, *R. habrotrichum*, *R. calophyllum* and *R. sutchuenense*.

Among deciduous shrubs that were in full flower when the frost came, the blossoms of *Viburnum Carlesii*, *V. bithuiense* and *Staphylea holocarpa* were quite destroyed, but the flowers of *Spiraea arguta* and *Exochorda grandiflora* remained unharmed.

The merits of *Exochorda*—the Pearl Bush—seem not to be generally recognised by amateurs. One may visit a score of good gardens without coming across a single specimen; yet it may claim very high rank among flowering shrubs. There are two or three species; I think that *E. grandiflora* is the one we grow here. It is perfectly hardy, flowers abundantly every year, is easily raised from seeds which it ripens in quantity, and, growing ten or twelve feet high, is a truly beautiful object in early May. Nearly related to the *Spiraeas*, the flowers of the Pearl Bush are much larger than those of any *Spiraea*. *E. grandiflora* is a Chinese species (*Bot. Mag.*, t. 4, 795).

Herbaceous borders are apt to be much disfigured by the use of white, wooden labels, and I am grateful to Messrs. W. Wood and Son, of Taplow, for supplying me with wooden labels painted green. They retain a pencilled inscription much better than those painted white, remaining quite legible for two or three seasons, or until such time as it may be desirable

to replace them with permanent metal labels. Another useful device consists of the patent pot crocks made by Mr. C. E. West, of Higham Hill, E. 17. They are convex discs of perforated zinc, and serve as a clean and convenient substitute for the broken potherds usually used for drainage when potting plants. Practically indestructible, they may be used again when the plants are shifted from the pots.

Probably your correspondent, S. W. D., has not made acquaintance with the Chinese species of *Pokeberry*, *Phytolacca clavigera* (*Bot. Mag.*, t. 8, 978), else he would not have recommended the very inferior North American species, *P. decandra* (page 318). In stature, habit and general appearance, the two species are very much alike, save that the flowers of *P. clavigera* consist of a bright, rose-coloured perianth set round the prominent green ovaries, which, in ripening, are crimson at first, afterwards turning to the same glistening black that distinguishes those of *P. decandra*. Seeds were first sent home by Forrest from Yunnan in 1913, and the plant has proved quite hardy in this country, although the young growth is apt to be cut by untimely frost in May. *Herbert Maxwell, Monreith.*

## A REVISION OF VIOLAS.

(Continued from page 249).

*V. CAESPITOSA*—The only *Viola* of this name is *V. caespitosa*, Lange, and it is probably a faulty description of this which Farrer had in front of him. It belongs to the *Kitaibelianae* section of *Tricolor* *Violas*, not very condensed, however, as it grows as much as eight inches high. It is very branching and forms tufts that are as much as a foot across. The yellow flowers are intermediate in size between *V. tricolor* and *V. arvensis*. It is a species, not of the East, but of Portugal (as on the Serra da Estrella), and parts of Spain. It ascends sometimes to alpine heights.

*V. calcarata* is the occasion for a page of prose-poetry by Farrer, in which, however, it is impossible to put one's finger on an exaggeration. Those who have seen either the wide circles of this *Viola*, multi-coloured and luminous, on the way up to the Little Mont Cenis Pass in early July, or the extraordinary expanse of blueness carried so far as the eye can reach on the Western side of the Mont Joli Pass (like the expanses of Heather on the Portsmouth Road as one goes out to Wisley in August), will not attempt to disparage Farrer's enthusiasm. It is a desolating thought that only the common blue-purple form can be obtained from English nurseries, and that generally at an inordinate price; the white form may be come by in one or two Continental nurseries; but that is all. I have searched lists in vain for the brilliant yellow forms, from palest citron to oldest gold; and as for the flowers of "citron and bronze and violet," an Award of Merit surely awaits the introducer thereof, though the highest desire is to reproduce those multi-coloured circles of the Mont Cenis. Farrer hardly does justice to *V. Zoysii*. This is rated as a distinct species, and will be dealt with in its proper alphabetical order. *V. elongata* is a name which I have, so far, failed to trace. *V. Eugeniae* has been taken out of the *Calcaratae* into the *Altaicae*. *V. corsica* is a synonym of *V. Bertolonii*, the Corsican species dealt with previously. *V. aetnensis* belongs, as already stated, to the *heterophylla* group, and *V. nebrodensis* is now recognised as an *altaica* species.

*V. calycina*.—The relative position of this plant has been thoroughly cleared up by Becker. Except in stating that it has yellow flowers, that it comes from Pisidia (southern Asia Minor), and that the calyx lobes are broad and blunt, Farrer's description puts the reader on the wrong trail, probably because he put over-much confidence in the work of Boissier, to whose *V. olympica* he related it. For the unravelling of this confusion, I must refer readers to my article on *Viola gracilis* in *The Gardeners' Chronicle* of September 18, last year; here it

Indispensable in the Garden

## THOMSON'S MANURES

On the market for over 50 years, they still hold first place for **QUALITY** and **RESULTS**. They are safe, sure and lasting. The direct result of many years' practical experience in gardening, they stand unrivalled at the present day for all Garden Crops.

Prices:—**VINE, PLANT AND VEGETABLE MANURE**—a Perfect Food—1 cwt., 30/-; 56lb. 18/-; 28lb. 9/-; 14lb. 5/-; 7lb. 3/-; tins, 1/3 and 9d.

**SPECIAL TOP DRESSING MANURE**—an excellent stimulant—56lb. 17/-; 28lb. 9/6; 14lb. 5/6; 7lb. 3/-; tins, 1/3; Carriage paid on 28 lbs. and up.

WRITE FOR OUR BOOKLET—POST FREE ON REQUEST  
SOLD BY NURSERYMEN AND SEEDSMEN EVERYWHERE.

Or from Sole Makers, WM. THOMSON & SONS, Ltd., TWEED VINEYARDS, CLOVENFORDS, SCOTLAND.

## Boulton & Paul for Modern Glasshouses

**B**oulton & Paul Conservatories and Greenhouses can be seen all over the British Isles, and after very many years' wear they still bear that mark of quality, design and craftsmanship associated with all their products. Let Boulton & Paul undertake your Horticultural Work, and you will be sure of right design and workmanship.

The service of an expert staff of designers is always at the disposal of clients, and we are ready to advise on any subject given. A representative will be sent by appointment to consult and prepare schemes for any kind of Horticultural work.

Ask for our free Catalogue No. 752.

## THE WORLD'S FINEST DAHLIAS FOR BEDDING

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.——No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about 14 feet in height.

### JANET

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Rich deep apricot, with a suffusion of deep orange—a glorious colour; the individual flowers are not quite so large as those of 'Coltness Gem,' and it is of rather more dwarf habit. In freedom of bloom, upright stems carrying the flowers clear of the foliage, and general characteristics, it is a counterpart, a fine companion, to 'Coltness.'

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

#### PRICES:

<b>COLTNESS GEM—</b>	doz.	100
Strong plants in small pots	6/-	45/-
Strong plants in $3\frac{1}{2}$ in. pots	7/6	55/-
Extra large in 5 in. pots	12/-	& 15/-

#### ADA, also JANET—

Strong plants in small pots	7/6	55/-
Strong plants in $3\frac{1}{2}$ in. pots	10/6	80/-
Extra strong in 5 in. pots	15/-	—

All will bloom freely this season.

## WHAT USERS SAY:

"The 'Governor' Motor Lawn Mower gives me the greatest satisfaction. In two half days the gardener does by himself mowing which previously took him nearly two whole days with an additional man to help. I am strongly recommending it."

E. W. RAVEN-HILL,  
Park House, Brentwood.

"It is easy to start, easily manipulated in confined spaces and has made a good job of the heaviest growth without any trouble whatever." (Extracted).

"We have nothing but praise for the water-cooled 'Governor.' It gives no mechanical trouble and works economically and quickly. Absence of complicated parts is a strong point in its favour."

J. H. MATTHEWS,  
Aldridge Cricket Club,  
Walsall.

"The 'Governor' is quite the best mechanical job of its sort that I have yet seen."

FREDK. A. FITCH,  
M.I.M.T.,  
Tunbridge Wells.

"I do not wish for a more efficient machine, and the very moderate price is an additional attraction."

M. W. MYERS, D.D.  
Frodsham, Cheshire.

Either model may be obtained on Easy Payment Terms. If desired without any extra cost. 5% Discount for Cash. 12-months' Guarantee with each machine. Free delivery to any station in Great Britain or at any port in Ireland.

Write for Folder G, describing either model and giving details of our free seven-day Trial on your own grass. Address

Sales Director:

SHADING

The only genuine, original  
and improved article.

In Tins, Green or White  
shade, 1/6 and 3/- each.

Do not be advised to use  
any other.

Trade Mark.

Reg. No. 14,629.

may be briefly stated that *V. olympica*, Boissier, is synonymous with *V. gracilis*, Sibthorpe and Smith (the true *V. gracilis*), and that *V. calycina* is a sub-species of *V. gracilis*. Being a form of *V. gracilis*, *V. calycina* is not confined to Pisidia, but is found throughout the area of the main species, as in northern Asia Minor in the Kastamuni district and in Pontus. These strange names, by the way, are to be found in any small atlas.

*V. canadensis*.—There is nothing to add to the description of this, except that it is the outside of the petals that is tinged with violet. *V. scopulorum* is now classed as a distinct species, and is half the size of *V. canadensis* in all its parts. *V. Rydbergii* should be known under the more general name of *V. rugulosa*, Greene, the former name having been given to the Rocky Mountains plant, which is only distinguishable from the type by its broader leaves. All forms are a particularly attractive stemmed Violet. *E. Enever Todd, Lt.-Col.*

(To be continued.)

## FRUIT GROWING IN THE WESTERN CAPE PROVINCE.

(Concluded from page 340.)

### APPLES.

My experience in South Africa confirms my opinion that the best Apples cannot be grown in a temperature which will ripen the vine. The fruit may be perfect to look at but flavour is lacking and texture hard and woody.

I was nearly leaving the country without a good word for the South African Apple, when, just at the last moment, I was presented with a case of Jonathan, which were grown high up at Ceres. They were first-class, but this country is cold in winter and not a real vine country. Marvellous Apples are grown at Elgin, about thirty miles from Cape Town, to the East, on an extraordinarily shaly soil. I tried Cox's Orange Pippin from this part in various stages of ripeness but they do not approach the English-grown fruits for flavour and excellence, but for appearance and size they are remarkable.

A very curious feature of all South African Apples is their variation in size and shape from the English normal. They are apt to grow much broader and flatter and the eye is very deeply sunken; in fact, Cox's Orange Pippin closely resembles our Court Pendu Plat, while Reinette du Canada would almost pass in England for a Bramley's Seedling.

One of the principal varieties grown is, curiously enough, the old Rymer or Caldwell, which is known as Versfeld's Warner's King. The true Warner's King is also grown; its appearance is very different from fruit grown in this country, but the habit of tree and leaf shows that it is the same. Other Apples much grown are Ohinemuri (Monro's Favourite), an Australian variety; Wemmershoeck, an old Dutch sort; Rome Beauty, Reinette du Canada, Delicious, Spitzenberg, White Winter Pearmain, Cleopatra, and a few trees of Ribston Pippin, Cox's Orange Pippin, King of Tompkin's County and Blue Pearmain.

At the Experiment Station at Stellenbosch there were a good many English varieties; Allington Pippin crops enormously, but ripens too quickly in the heat, as do Ribston Pippin and Cox's Orange Pippin.

### OTHER FRUITS.

With regard to other fruits, no great quantities are seen of Figs, though they do quite well and their cultivation might be worth encouraging for the export trade.

Almonds are not yet much grown, nor have Olives been seriously tried. There seems a possibility for both of these fruits in the future.

### PESTS AND DISEASES.

The most striking thing to the visitor from Europe is the general cleanliness of the trees, and thanks to the dry spring and summer,

fungous pests are of no account, the spotted and scabbed Apples only too familiar in this country, being very rarely seen, and the leaves of the trees uneaten by caterpillars lead one to envious thoughts. However, all these advantages are wiped out by the terrible ravages of the codlin moth, which was introduced about thirty years ago and whose presence must cause a loss of thousands of pounds annually to fruit growers from damaged fruits and the frequent arsenical sprayings which are necessary. The moth produces three or four broods each summer, and spraying has to be continued for late Pears until shortly before picking, so many as seven separate sprayings being sometimes required. The cost of these measures must be enormous, and however "free trade" one's feelings may be, one sympathises with the stringent restrictions which the Union now imposes on all horticultural importations. If the preventive spraying is curtailed so many as fifty per cent of the Pears may be attacked by the Codlin Moth and so rendered unsuitable for export, and not content with Apples and Pears, the moth also attacks Plums, Peaches and Apricots. Great care is taken by most growers to trap them with bands of sacking and by

in Peaches, but the general opinion of growers seemed to be that it was not of importance, but remembering that this opinion was also shared by many in this country some years ago, I think the matter should be closely watched.

There seems a marked absence of leaf-eating caterpillars, such as the Winter Moth and Tortrix. Should any by accident arrive in the country, I think they would have but little chance of surviving, so well-sprayed are the trees. In view, however, of the great number of Oaks in the south-western Cape Province, the Tortrix might be of considerable trouble there if they should obtain entry.

### STOCKS.

The dominant factor of all fruit-growing is the question of water supply. This fact is often masked from us in northern Europe, as we can generally count on sufficient for our needs. In South Africa it is hopeless to use any shallow-rooted stock, such as the Quince for Pears, or the Paradise for Apples, and seedling stocks with their deep, tap-roots, are absolutely necessary. The Pears are, therefore, grown on the seedling Pear; the Peaches, Japanese

FIG. 169.—DRYING GROUND FOR FRUIT IN SOUTH AFRICA.

scraping the trees in winter to prevent them wintering over on the tree, but even all these precautions do not prevent the severe attacks above-mentioned.

No greater service could be done to South African fruit culture than to find some lethal method which did not involve the use of arsenic or other poison. Owing to stringent Government control, there is very little danger of fruit being exported containing any dangerous proportion of arsenic, as each fruit is wiped over before packing, and should arsenic be found in any dangerous quantity, export is not permitted. South Africans point out that the fruit for home consumption is not tested in this way, and that there has been no serious mortality among fruit-eaters—quite a good point to make. The Government, however, rightly prefers to run no risk, and maintains its stringent inspection of all exported fruit.

American Blight is, and has been, troublesome, but is now being effectively dealt with by *Aphelinus mali*.

Mealy Bug, our greenhouse pest, thrives in the open and requires constant attention in the warmer districts, while a pest new to me called the American Bug, a large edition of American Blight, was troublesome here and there.

I noticed a certain amount of Silver Leaf

Plums and Apricots are all on the Peach seedling stock, while Apples are mostly on the free stock.

The use of the Northern Spy, with its resistance to American Blight, was at one time greatly advocated, and the Government of the Transvaal at one time went so far as to make its use for Apples compulsory. From what I have seen of trees worked on this stock, I should think it would be far too dwarfing and give up in dry years. The anchorage also is very bad and a number of trees are blown over by prevalent winds. I imagine that in ten years' time very few trees will be planted on this stock, and the Government will, if Governments can ever admit mistakes, repeal their hastily passed legislation.

In the Hex River Valley I saw an acreage of Pears on the so-called Japanese stock, probably *Pyrus ussuriensis*, which were being grubbed out as being unsuitable, which confirms my own trials with this stock in England.

### CLEAN CULTIVATION AND PACKING.

It is from California in the main that South African fruit-growers have learned their business, and, on the whole, they have proved apt pupils. On most farms operations are carried out in the

most efficient manner, and many would be a model to British growers, so far as cleanliness is concerned. If one may venture to suggest any improvement, it is in the selection of varieties. Many of our best quality fruits do not seem to have been tried, especially among Peaches, and it seems quite probable that an improvement in this direction might be realised.

With regard to packing, cold storage and transit, the evidence is before us in the excellent condition of the fruit as it arrives in our markets, and on this side we must admit we have much to learn from them.

#### PROSPECTS OF EXTENSION.

As to the possibility of extension, opinions, of course, differ, some of a pessimistic turn of mind consider the limit of production has been reached; others, however, think that the industry is but in its early stages of development.

FIG. 170.—APPLE CRAWLEY BEAUTY; A LATE-FLOWERING VARIETY.

Experiments are being made with new markets, such as South America, and they justify the hope that the countries where fruit is sold may be extended.

A great deal of the possible fruit-growing area in South Africa is, of course, ruled out by the great distance from port, rail charges being too great, but even near the Cape there is still plenty of land suitable, and not too far from the railway. Where an English colony is settled, unplanted land may fetch £100 or so an acre, but in unsettled districts good land may be bought for £10 an acre, a certain social value entering in.

For the young man just starting fruit-growing, I think there is a chance, provided he has capital and is willing to work up from below as many young South Africans and Englishmen are now doing. Perhaps the most interesting feature is the desire of most young men born on the land to continue the life of their fathers rather than go to the town; a fact of hopeful augury for the future of South Africa. *Edward A. Bunyard.*

## FRUIT GARDEN.

### LATE-FLOWERING APPLES.

IN districts where late frosts are prevalent it is advisable to grow a certain number of late-flowering Apples. Besides having a better chance of escaping late spring frosts, they are usually, to some extent, more free from the attacks of insect pests.

In a large collection of Apples it is remarkable to see the difference in the flowering periods between the earliest and latest to bloom; for example, in 1925, Astrachan Red opened its first flowers on April 21, whereas Crawley Beauty did not commence to flower until May 25 (Fig. 170).

It is not uncommon to see some varieties, such as River's Early Peach, in full flower (Fig. 171), and at the same time others with their buds almost dormant, as in the case of Crawley Beauty.

The following is a list, with brief descriptions, of varieties of Apples which flower very late.

### STRAWBERRIES.

THERE appears to be some evidence that there is an increasing difficulty in keeping up the vigour of Strawberries growing in the Home Counties. During the autumn of 1923, Mr. W. H. Johns wrote at some length regarding the Red Plant Disease. While the eel-worm under notice was considered microscopic, it may be noted there is one of a much larger and thread-like type which attacks the plant.

Mr. Johns stated that where first-class cultivation is carried out there is but little to complain of, but many will be disinclined to agree with this statement, for where every attention has been given the plants rapid deterioration has gone on, and particularly on cold, heavy soils. The foliage becomes brown and withered-looking.

It would be interesting to know if any readers of this note have carried out any experiments with soil fumigants in relation to this trouble.

The introduction of new stock and planting on fresh ground are not apparently a guarantee against it. *A. J. Hartless, King's Walden Bury Gardens, Hitchin.*

### INDUCING DORMANT BUDS TO BREAK.

ANY well-placed buds on fruit trees which appear likely to remain dormant should be made to break by practising what is termed notching. Make an incision just above the dormant bud that is required to break and form a permanent branch. The incision should be deep enough to penetrate the wood. I have repeatedly practised notching with every success on old, horizontally-trained trees, where a new tier of branches was required, notwithstanding the buds have been practically invisible. When making the incision above the buds on the larger trees I often use a saw for the purpose, as the cut does not heal over so quickly as one made with the knife. The first year after the operation, the bud sometimes only plumps up, but the following year quite strong growths are produced. *H. M.*

## FRUIT REGISTER.

### APPLE RIVERS' EARLY PEACH.

THIS variety, which the illustration reproduced in Fig. 171 shows in flower, is of the Irish Peach type, but ripens a little earlier, and is in season about the middle of August. It has another distinction in that it does not bear its fruits at the ends of the branches.

It was raised by Messrs. Rivers and Son, but is not cultivated extensively for, like most early Apples, the quality is only poor; Bunyard, in his *Handbook of Fruits*, states that the flesh, whilst being sweet and aromatic, is apt to be a little dry. The tree is very fertile and makes a very pretty pyramid.

The fruits are flat-conical, coloured very pale creamy-yellow, with sometimes a faint flush. As stated by Mr. Wilson in his note on "Late-flowering Apples," Rivers' Early Peach is one of the first varieties to blossom, and whilst these precocious flowerers are apt to be ruined by frost in some seasons, they may escape injury when frosts occur very late owing to the fruits being already formed.

### APPLE WYKEN PIPPIN.

THIS finely-flavoured Apple deserves to be more generally planted than is the case at present, for at Christmas, when the variety is usually at its best, the fruits are a most welcome addition to the dessert table and they will often remain in good condition until March.

The fruits are of medium size, flat-round, even in outline, and yellow when thoroughly ripe. The flesh is crisp and the flavour more than ordinarily good. The tree is a compact grower, fertile, and a regular cropper; it makes an excellent standard for orchard planting and is a success trained in bush form.

This fine old Apple was discovered at Wyken, near Coventry, nearly 150 years ago.

### PEAR BEURRÉ BOSCH.

THIS is an excellent Pear for a warm situation, such as a south or west wall. It is in season from October to November. The fruits are of medium to large size, long, pyriform, yellow-

almost completely covered with cinnamon russet, so that the general appearance is a uniform brown colour.

The flesh is melting, very juicy and aromatic, and for flavour alone, Beurré Bosc compares favourably with most Pears.

It is a good variety for maritime districts and for chalky soils.

It was introduced to cultivation by Van Mons, and is sometimes called *Calebasse Bosc*; in Gloucestershire we have invariably gathered a fair crop of fine, well-flavoured fruits from cordon trees growing against a south wall. *Ralph E. Arnold.*

## THE CELERY FLY.

(*ACIDIA HERACLEI*.)

THE larvae of the Celery fly, or as it is sometimes called, the Celery-leaf Miner, often becomes a serious pest on Celery and allied plants towards the end of the summer or in early autumn. At those times control measures are difficult, and even if successful much damage is done to the crop before the pest is eradicated. It would appear that if control measures were adopted earlier in the season the damage to the crop might be reduced.

*A. heraclei* passes the winter in the pupal stage in the soil, near to the host plant. Sometimes a few specimens pupate in the old foliage, but this is not general. Towards the end of April, the adult flies begin to emerge, and in favourable weather during the first week of May, if Celery and Parsnip foliage be carefully watched, the female flies may be detected running about over the plants selecting positions in which to deposit their eggs. The emergence of the perfect insects from the pupal stage covers rather a long period. Early specimens may be found towards the end of April and late specimens can be taken towards the end of May. This protracted egg-laying period has led some observers into the error of stating that there are: "several broods or generations in the course of the summer." I have never been able to detect more than two; one extending from late spring to early summer, and the second extending from August to October, or even later.

Under most garden conditions it is the second generation of the Celery Fly which does the greatest amount of damage, and it is interesting to consider why this should be. At first one is tempted to think that something happens each winter which so reduces the numbers of the resting puparium stage that few survive to emerge the following spring and that, owing to this, the first generation of the pest is small. Under the favourable summer conditions every fly from the first generation comes through, and hence the second generation is always a heavy one. This is an easy way of explaining the situation, but it is not true.

The true explanation appears to me to be that the breeding of the main part of the first generation does not take place in cultivated plants at all, but in a wild host plant, namely, Hogweed, *Heracleum Sphondylium*, Linn. In my district this plant is always heavily attacked with a leaf miner, which I have repeatedly bred out, and the flies have been identified by various authorities as being *A. heraclei*. As this wild host plant is common throughout Britain, it would appear reasonable to suppose that what the Celery fly does in my district it does in most of Britain. I am confident that under my conditions the main part of the first generation breeds in the wild Hogweed, and that the second generation comes to the Celery.

Another curious thing is that in spite of continual search, I have failed to find the second generation of the pest on Hogweed. The second generation seems to breed entirely in Celery and Parsnips.

In undertaking control measures for checking attacks of Celery fly, it must be remembered that during the winter and very early spring the pest is safely situated in the soil on the sites of last year's Parsnip and Celery crops. On the appearance of the flies in the spring their egg-laying activities are divided, because it takes place, to a limited extent on Parsnips and Celery;

but the greatest number are laid in the wild host plant, Hogweed; cultivated *Heracleums* and probably many other umbelliferous plants are also attacked.

On the appearance of the second generation, the egg-laying activities are restricted mainly to cultivated Parsnips and Celery, and it is this generation that causes the gardener the greatest amount of trouble.

As it is always an advantage to apply control measures to an insect pest when the latter is all in one stage and in one position, it would seem that this is only possible at some period during the winter. The disadvantage of this

The best treatment I have used up to the present has been to apply crude naphthalene at the rate of two ounces per square yard, at the end of March. I have found that when naphthalene is applied at that period it kills better than when applied earlier. Why this should be so I do not know, unless it be that the pest is more susceptible to naphthalene as it approaches maturity.

The practice of sowing a trap crop, for the purpose of collecting certain insect pests scattered over a wide area into definite positions so that expensive control measures can be economically applied, is steadily gaining ground. The

FIG. 171.—APPLE RIVER'S EARLY PEACH; AN EARLY-FLOWERING VARIETY.

is that the puparium stage is not easy to kill, but in spite of this, the effort is worth while, because then, and then only, are all the Celery flies in one stage and in one position. The advantages of winter treatment are obvious, e.g., the main methods of control in the past have been: (1) Treating the host plants with some substance which is distasteful to the flies so that they go elsewhere to lay their eggs; (2) treating the foliage of the host plants with a nicotine wash, so that the larvae are killed within the leaf. If success is to be gained either of the above control measures have to be repeated over a fairly long period, because when used once, only part of the generation is dealt with.

practice has attracted a good deal of attention in America, and is being tried in this country, especially with regard to wireworms. To use the trap method for the control of Celery fly is easy, because the only two plants that appear to be attacked by the second generation are Parsnips and Celery, and if the sites of these crops were systematically treated each year at the time stated in the last paragraph, it could have no other effect than to reduce the pest considerably.

*A. heraclei* is often badly attacked by several parasitic insects; the common parasite with me is *Adelura Apii*, Curtis, but I do not find that this parasite is most common in any one generation. *Somers.*

## VEGETABLE GARDEN.

## FORCING SEAKALE.

My method of forcing Seakale last winter may be of interest; it involves less trouble than that described by Mr. H. H. Cook on page 289.

My plan in former years has been to force the crowns in a Mushroom house, but fuel being scarce, I could not afford to employ heat there last winter. I made some long boxes, seven inches deep and just wide enough to stand on the gratings over the hot-water pipes, where these came through from the boiler.

The crowns were put closely together in the boxes with just enough room to shake some finely sifted soil down between. I made tops to the boxes, with an overlapping rim and two slats across the top, which allowed another seven inches for growth, and covered all over with sacks to exclude the light. When the produce from the first box was cut the latter was re-filled with more crowns, which can be stored beforehand in sifted ashes out-of-doors, at the foot of a wall or in any convenient place and not necessarily indoors.

Mr. Cook advises the use of a hot-bed with a frame on top. I am afraid the hot-bed would require remarking each time the frame was refilled; the warmth from such a bed is not very lasting in mid-winter unless it is a very large one, in which case the grower would have too much produce at one time for a private garden.

The boxes are stood outside, with the crowns exposed to frost, until they are required. I have just finished cutting the heads in the last one, which did not require to be taken into heat, but was well covered up outside with a waterproof sheet over all to exclude the light. In planting the thongs, I reduce the shoots to one. If more shoots were left, as suggested by Mr. Cook, it would mean unnecessary labour in reducing them to single crowns later. *Grigor Roy.*

## RUNNER BEANS.

SEEDS of this indispensable vegetable should be sown in the early weeks of May, and where possible, it is far the best to sow and raise them under glass. Procure boxes about four inches deep and fifteen inches or so square; place a few crocks in the bottom, covering these with half decayed leaves or manure to facilitate good drainage. Prepare a compost of two parts loam, one part leaf-soil, of Oak or Beech leaves for preference, and one part old Mushroom-bed manure, with a liberal dash of road or river sand to render the texture porous. Pass all these materials through a half-inch sieve.

Fill the boxes with the compost and press the seeds in edgeways, about three inches apart. Make the soil fairly firm and add sufficient fine compost to cover the seeds about an inch. Place the boxes in a vinery or Peach house or, failing these, a heated pit, and well water the soil in them. Cover each box with paper to prevent the soil drying out. The seeds will germinate quickly and, so soon as all are up, remove them to a cold frame so that they may grow sturdily. Select ground for this crop that has been trenched or dug deeply, and choose an open, sunny situation. If trenched ground is not available a trench may be made about two feet wide and the same in depth, well breaking up the sub-soil, and mixing with it garden refuse or other material that will tend to keep it open. Place one foot of the fine top-soil in the bottom and mix it with decayed farmyard manure, then add the remainder of the soil. When the trench is filled, allow the soil to settle before putting out the plants. Dust the surface soil liberally with soot and wood-ash, and a few days before planting, fork these materials lightly in the ground, and make the latter firm again before planting.

Runner Beans require adequate supports, and these should be placed in position before planting. Place two stout poles at each end of the trench, about a foot or fifteen inches apart, and others at intervals along the trench, if it is a long one, then fasten fairly stout wire from end to end, about six feet or so from the ground. Whether tall Pea sticks or poles are

used, these should be tied securely to the wires with fine tar-twine, and placed about a foot apart. When staking is completed, rake the surface finely, and all will be ready for planting. Harden the plants by removing the frame lights during the daytime. About the end of May or early in June is soon enough to set out the plants, and even then the grower should have thin tiffany or other suitable material ready at hand for covering them if frost occurs. Remove each plant separately from the box with a trowel and place one at the base of each pole; nothing is gained by crowding the rows, rather the reverse.

In sowing Runner Beans outdoors it is advisable to sow fairly thickly and thin the seedlings rigorously, leaving only the strongest and healthiest plants. The stakes should always be placed in position so soon as possible as they will afford protection to the plants from frost, and the seedlings will not be so likely to be damaged at the roots in the operation. When all the Beans have been planted, make the ground tidy around them with a fine rake, and if the weather is dry water them with a rosed can the following morning, so that the plants are dry by nightfall. This is all the attention that will be needed for a week or two until danger of late frost is over.

It is not advisable to give the roots an excess of water at this early stage of growth, rather keep the ground between them well stirred with the Dutch hoe.

Although the Runner Bean is a climbing plant, it is well to tie the leading growths to the supports with a piece of broad raffia.

For ordinary household use the plants may be allowed to grow at will, but to obtain pods for exhibition, not more than two or three growths should be retained on each plant, and the Beans themselves thinned to two or three at each cluster.

When the plants are growing freely they should be mulched with straw litter to prevent evaporation of the soil moisture; this is much better than overwatering, which is often a cause of the young Beans dropping. If the roots get down into a cold, stiff subsoil this will also cause the embryo pods to drop. The Beans should be picked so soon as they are ready.

There are several good varieties of the scarlet-flowered type, and also some that have white flowers, and both are very ornamental as well as useful.

During hot, dry weather, Runner Beans are much benefited by frequent syringings with rain water. When watering the roots it should be done thoroughly, and frequent applications of diluted manure water will help to keep the plants growing freely and produce fine crops of high-class pods. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## CHINESE MUSTARD.

MR. SAUNDERS (*Gard. Chron.*, April 16, 1927, p. 271) identifies Chinese Mustard as *Brassica nigra*, syn. *Sinapis nigra*. Vilmorin-Andrieux (*Les Plantes Potagères*, 4th Ed., 1925, and 3rd Ed., 1904) gives it as *Brassica* (seu *Sinapis*) *junceae*. In my earlier days of cultivating this useful vegetable, I sent specimens to Kew whence, under date of July 16, 1920, was reported: "The Chinese Mustard is almost certainly *Brassica rugosa*, Prain. You will find a learned and very interesting account of the various Mustards in *Bull.* No. 4, in *Agric.* series No. 3. Dept. of Land Records and Agric., Bengal, 1898. *B. rugosa* makes quite a Cabbage growth in its early stages, whilst *B. juncea* is rather a weedy, straggling type of plant."

Further, Vilmorin alludes to a large-leaved variety of *Brassica* or *Sinapis nigra* as *Moutarde noir d'Alsace*; can this be the plant to which Mr. Saunders makes reference?

Of the Turnip-rooted varieties, the first I had from M. de Noter had leaves and habit much like the normal stock, i.e., much like a Pé Tsai, but it gave a poor yield and seemed less worthy than the ordinary Turnip. Later, he wrote that this was a wrong strain, and sent another sort with lacinate leaves (*vide* Vilmorin), the foliage being very deeply-cut. However, this, too, failed to give any good return; the roots were rather hard and rank, so I deter-

mined to stop the further growing of this strain.

Last autumn both Chinese Mustard and Pé Tsai were severely attacked by the gall weevil, at the same time they were very dwarfed in growth, so that the whole crop was sheared off for a single dish and the remains of the plants burnt, that is with the exception of a few which were sent to Harpenden, whence it was reported that it was unusual for the gall beetle to cause interference with growth—that is, in the more usual Brassicas. As all the plants were affected (many with six or eight galls) and all were dwarfed, there was no comparative control, except by comparison with the familiar growth of former years. I incline to the belief that the sappy, soft growth of these plants might be far more affected than is the case with the woody stem of the Brussels Sprouts or Broccolis, and was, indeed, the cause of the dwarfing. Next July, when sowing this year's crop, I propose to incorporate "Para dichlor benzene" ("Pesta") in the seed-bed and also when planting out. *H. E. Durham.*

## HOME CORRESPONDENCE.

***Tropaeolum tuberosum*.**—During the last three years, I have endeavoured to grow this plant, trying it in heavy soil, also in a light, very hot and dry positions against a house with less than a dozen flowers resulting, and those very late in the season. Can there be two varieties of this plant? During the 'seventies and early 'eighties, I remember it growing over a summer house in South Fife, and against a house wall near Edinburgh. In both places it grew luxuriantly and flowered very freely over quite a long period, making a very effective display. *P. M. T., Hereford.*

**High Price for a Cherry Orchard.**—In the interest of historical accuracy, may I correct your statement on page 332. The record price given for this orchard at Teynham included the trees and land, as well as the fruit. The sales of the fruit are usually held early in June. Profitable as Cherry-growing is, I do not think it has ever approached the sum of £450 per acre! *Edward A. Bunyard.*

## PUBLIC PARKS AND GARDENS.

A SUGGESTION is made by the Newcastle-upon-Tyne Society to preserve an unbroken belt of parks, moor and pathway around Newcastle, and the scheme will shortly be submitted to the City Council. The sylvan belt will be drawn in the form of a curve from Scotswood, Denton Dene, round the Town Moor to Heaton, Ouseburn Vale. The Society suggests that in Ouseburn Vale a stretch of land now neglected should be saved from further damage and made a public park; that the semi-rural character of the road linking Jesmond Dene with the Town Moor should be maintained; that Denton Dene, a wooded dell, should be rescued from the builders and made a public park for Elswick, Scotswood, and Lemington; and that the roads already planned to link Scotswood and Denton Dene with the Town Moor should be adjusted so as to form a smooth-curved parkway to the north-west corner of the Town Moor, and that eventually a new road should be constructed along the northern edge of the moor.

BOOKHAM Parish Council has decided to purchase land for the extension of the recreation ground, and to raise a loan of £1,000 to defray the cost and provide for its development.

THE Middlesex County Council has received sanction from the Ministry of Health to borrow £2,550 as a contribution towards the cost of the acquisition by the Twickenham Town Council of a portion of Orleans House estate, known as River Meadow, for a public open space.

## SOCIETIES.

### MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, April 22, the members of Committee present were Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. A. Burns, Mr. A. Coningsby, Mr. J. Cypher, Mr. J. Evans, Mr. A. Keeling, Mr. D. McLeod and Mr. H. Arthur (Secretary).

Mr. B. Collins and Mr. A. Greenfield were invited to sit with the Committee.

#### FIRST CLASS CERTIFICATE.

*Cymbidium Pauwelsii aureum* var. Mrs. Astley Bell.—Flowers deep yellow. From HY. ASTLEY BELL, Esq.

#### AWARDS OF MERIT.

*Odontoglossum St. George* var. Rubens, Odm. *Mirum Towneley Grove* var.; Odm. *Corncrake*; *Miltonia Bleuana* var. Distinction, and *Lycaste brevispatha*.—From J. B. ADAMSON, Esq.

*Odontoglossum Margarita*, Llewelyn's var.; *Odontia Latona* var. G. V. Llewelyn; *Brasso-Cattleya Jupiter* var. Rex, and B.-C. *Queen Alexandra*, Llewelyn's var.—From G. V. LLEWELYN, Esq.

*Brasso-Cattleya Bianca*, B.-C. Digbyano Warneri, B.-C. Maronnet (C. Mendelii × B.-C. Maronnet); and *Odontoglossum crispum*, Vestey's variety.—From the Hon. G. E. VESTEY.

*Cypripedium Sullum* (Christopher, G. D. Nicholson × *Mirum*); and *Miltonia Henry Astley Bell*. From HY. ASTLEY BELL, Esq.

*Brasso-Cattleya Apollo*, Hey House var. and *Brasso-Laelio-Cattleya Rumania* var. gigantea.—From J. MCCARTNEY, Esq.

*Miltonia Lena* (vexillaria superba × *Charlesworthii*). From Messrs. CHARLESWORTH AND CO.

#### AWARDS OF APPRECIATION—FIRST CLASS.

*Miltonia Princess Mary* (Hyeana × *Bleuana*). From G. V. LLEWELYN, Esq.

#### CULTURAL CERTIFICATES.

Cultural Certificates were awarded to Mr. A. BURNS for *Lycaste Hughii* and *Sophrontis grandiflora*; to Mr. J. HOWES, for *Sophrontis Cattleya Anzac* var. *Vesuvius* and *Miltonia Bleuana*; to Mr. B. COLLINS, for *Lycaste Skinneri*; and to Mr. C. F. POTTS, for *Maxillaria Sanderiana*.

#### GROUPS.

J. B. ADAMSON Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded. It contained *Odontoglossums* in variety including *O. St. George* var. Rubens, *O. Mirum*, *Towneley Grove* var. *O. Corncrake*, *O. Phillisianum aureum*, and *O. aspersum*; *Odontia Theresa*, and *O. Gladys superba*; *Laelio-Cattleya G. S. Ball*, and *L.-C. highburiensis*; *Sophrontis Cattleya Anzac* var. *Vesuvius* (awarded a Silver-Gilt Medal), *Miltonia Bleuana* var. *Distinction*, *M. grandiflora* and others. J. MCCARTNEY, Esq., Bolton (gr. Mr. C. F. Potts), was awarded a Large Silver Medal for a group containing *Cattleya Mossiae*, *Brasso-Laelio-Cattleya Rumania*, *Brasso-Cattleya Apollo*, *Brassavola Digbyanum*, *Cypripedium bellatulum* and *Maxillaria Sanderiana*.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group to which a Silver Medal was awarded. The principal plants were *Cattleya speciosissima Stanleyi*; *Brasso-Cattleya Digbyano-Mossiae*; *Brasso-Laelio-Cattleya Philomela*; *Odontia Vuylstekeae*; *Odontoglossum Pescatorei*; *Lycaste Hughii*, *L. lasioglossa*, and *Sophrontis grandiflora*.

G. V. LLEWELYN, Esq., Southport, was also awarded a Silver Medal for a group containing *Miltonia Sanderiana*, *M. St. Andre*; *Cypripedium Lilian Greenwood*, *C. Mirabilis*, *Renanthera lmschootiana* and others.

The Hon. G. E. VESTEY, Birkdale (gr. Mr. B. Collins), was also awarded a Silver Medal for a group. *Odontoglossum crispum*, Vestey's var., *Odontia Cooksoniae*, *O. gattionense*, *O. Lawrenceanum*, *Brasso-Cattleya Bianca*, B.-C. *Digbyana-Warneri*, *Cattleya Mary Sander*,

*Lycaste Skinneri* and *Oncidium sarcodes* were all shown well. HY. ASTLEY BELL, Esq., Garstang (gr. Mr. W. Bryon), staged *Cymbidium Pauwelsii aureum* var. Mrs. Astley Bell, *Odontoglossum Princeps Bibesco* var. *Gloriette*, *Odontia rubellum*, *Cypripedium Sullum* and *Miltonia Hy. Astley Bell*. Capt. W. HORRIDGE, Bury (gr. Mr. A. Coningsby), staged well-flowered plants of *Dendrobium devonianum*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. H. Hough), staged *Odontoglossum Cervantesii* var. *Decorum*.

Messrs. CYPHER AND SONS, Cheltenham, staged a group to which a Silver Medal was awarded.

Messrs. KEELING AND SONS, Bradford, showed *Odontia Sanderiana*, O. Wm. Thompson and O. Vuylstekeae.

### BRITISH CARNATION.

THE following new Carnations have been registered by the British Carnation Society:—  
Evelyn Townley, a bright cerise variety registered by R. CHETWYND-STAPYLTON, Esq., Headlands, Great Berkhamsted.

### NATIONAL TULIP.

At the exhibition of the National Tulip Society held under the auspices of the R.H.S. in connection with the fortnightly meeting, on May 10 and 11 last, the Tulips made a very brave show.

After the blazing sunshine and almost tropical heat of the week-end the flowers were ushered into the cool Hall with the wind off the ice.

Young blooms, of which there were plenty, did not expand, whilst the conditions favoured the wide open flowers, the fully grown examples.

In the competition for the principal award for twelve dissimilar Tulips—the blue riband of the Society—a most exacting class to satisfy, five stands were staged. The competition was keen, and the first prize was awarded to Mr. C. W. NEEDHAM, Hale, with flowers grown in Surrey. As the Tulips were displayed on their respective boards (so put up to reveal to the judges their faults), the visitor was reminded of a tray of rare old china cups and saucers, set out for afternoon tea on some rare occasion.

Mr. NEEDHAM's examples of Sam Barlow and Mabel were well-flamed, and Masterpiece and Lady Constance Grosvenor, well feathered.

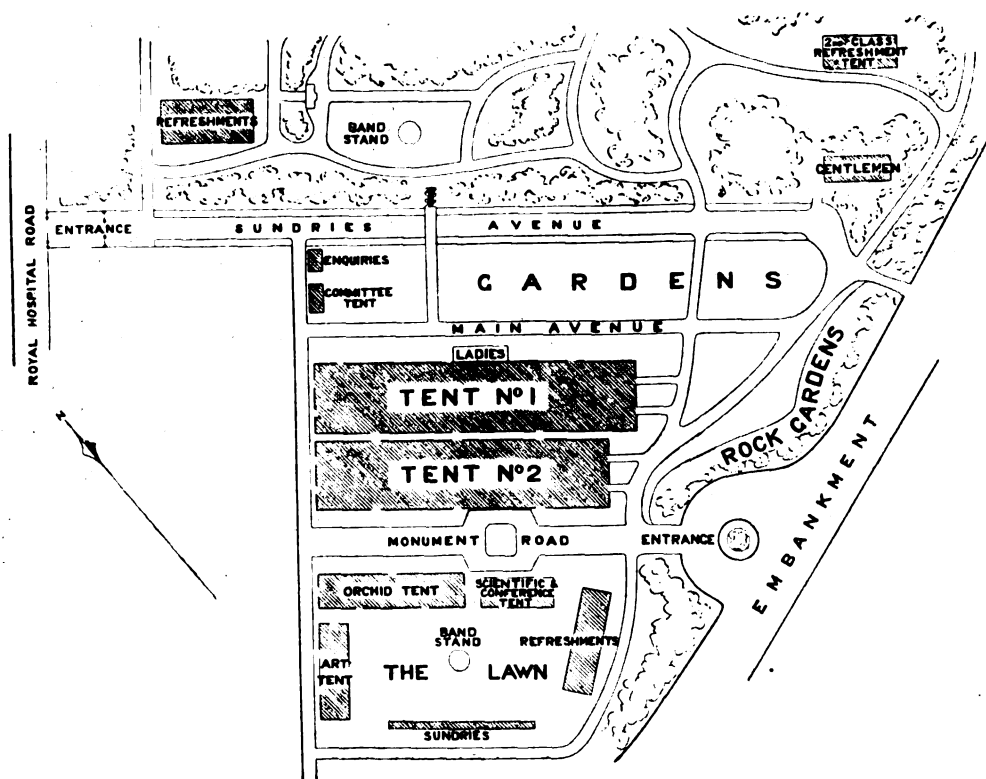

FIG. 172.—PLAN OF THE CHELSEA EXHIBITION, 1927.

(see p. 348.)

Mrs. J. L. MILLS, a rosy-salmon-pink variety, registered by Mr. J. L. MILLS, Tenson Court, Peterborough.

Clarice Page, scarlet, registered by Mr. W. H. PAGE, Tangley Nurseries, Hampton.

Wivelsfield Blush, white, overlaid pink; *Fragrant Lady*, white, overlaid with claret; *Cottlea Pink*, mauve-pink; *Edward Allwood Improved*, scarlet; *Wivelsfield Purple*, purple; *Clayton Cerise*, cerise, and *Clayton Pink*, salmon-pink; all registered by Messrs. ALLWOOD BROS., Wivelsfield Nurseries, Haywards Heath.

Gem, salmon pink; registered by E. MARTIN SMITH, Esq., Codicote Lodge, Welwyn.

Magnum, light salmon-pink, and Phoenix, red; both registered by H. T. MASON, Esq., Rectory Farm, Hampton Hill.

Mrs. A. SWANN, apricot ground, flushed and flaked with crimson; registered by Mr. A. SWANN, Colwood Gardens, Warminglid, Haywards Heath.

Ileriskit, salmon-pink; registered by Mr. WALTER HEMUS, Redcoats, Hampton.

Sunny, orange, slightly marked pink; *Spes*, scarlet cerise; and *Babs*, light rose-pink; all registered by Messrs. C. ENGELMANN, LTD., Saffron Walden, Essex.

Mr. W. PETERS, Cambridge, had an attractive stand of well matched flowers, including *Lucy Luard*—the best feathered bloom—and a specimen of the rarely seen *Julia Farnese*. Sir DANIEL HALL, Merton, had a rather unequal stand, but it contained six blooms of surpassing excellence, and the best flamed flower in A. M. Gregor.

Messrs. BARR AND SONS had blooms of fine colour and growth; a notable variety was *Wedding Coat*, an almost blaze feather on a white ground.

Mr. C. J. Fox, Birmingham, had beautifully marked examples, nearly in the bud state, not suited to the unkind temperature. His flower of *Stockport* was a fine one.

Sir DANIEL HALL won the first prizes in the class for six and for three flamed Tulips respectively.

Mr. PETERS won the first prize for three feathered flowers.

In the class for pairs,—the Samuel Barlow prize—Mr. NEEDHAM won with *Talisman*, feathered, and *Sam Barlow*, flamed.

In the Breeder classes, Sir DANIEL HALL was pre-eminent as well with his exhibits as with his seedlings. Annie McGregor, shown by

Mr. PETERS, one of the best rose Breeders raised by Martin seventy years ago, a brilliant scarlet on white, was adjudged to be the premier "breeder." As a rose breeder marking the greatest advance in seedling culture the recently raised Miss Willmott, a seedling of Sir D. Hall and exhibited by Messrs. BARR AND SONS, was conspicuous.

Feathered flowers were seen in excellent form. Mr. PETERS had a fine Universe, a purple feather of bluish tinge.

Perhaps the most striking bloom was a specimen of Britomart, a new seedling raised and shown by Sir D. HALL, a noble flower, smooth and level on the top, with purple marking, almost blue, on a shining white, satiny ground.

Taking Miss Willmott on the one hand and Britomart on the other, we have here the best results of the florist in his efforts to separate the red from the blue, as seen in the old-time purple of the bybloemen class.

### ROYAL HORTICULTURAL.

THE following awards have been made to the undermentioned vegetables by the Royal Horticultural Society, after trial at Wisley.

#### Autumn-sown Spinach.

##### AWARDS OF MERIT.

*Schietrees* (round-seeded), sent by Messrs. NUNHEM; *Prickly or Winter*, sent by Messrs. BARR AND SONS; *Thick-leaved Round*, sent by Messrs. ATLEE BURPEE AND CO.

##### HIGHLY COMMENDED.

Dwarf Thick-leaved Round, sent by Messrs. BARR AND SONS; Broad Flanders (round-seeded) sent by Messrs. BARR AND SONS; these two are much alike; *Prickly or Winter*, sent by Messrs. ATLEE BURPEE AND CO.

##### COMMENDED.

Broad-leaved Improved (prickly), sent by Messrs. COOPER, TABER AND CO.

#### Savoy.

##### AWARDS OF MERIT.

*Belleville*, sent by Messrs. WATKINS AND SIMPSON; *Favourite*, sent by Messrs. J. HARRISON AND CO.; *New Year*, sent by Mr. H. J. SPEED; *Late Drumhead*, sent by Mr. CULLEN; *Ormskirk Late Green*, sent by Mr. CLUCAS.

##### HIGHLY COMMENDED.

Perfection, sent by Messrs. FINNEY; Yellow King, sent by Messrs. ZWAAN AND DE WILJES; Late Market, sent by Messrs. FINNEY.

##### COMMENDED.

Dark Green Curled of Late Ormskirk type, sent by Messrs. DOBBIE AND CO.; Cartercone, sent by Messrs. J. CARTER AND CO.

### GUILDFORD AND DISTRICT GARDENERS'.

THE members of this Association held their first outing of the season on Saturday, April 30, when, favoured with a bright and sunny spring day, about one hundred of them paid a visit to Wancote, by kind permission of P. Lyle, Esq.

The visitors were received and conducted through the grounds by Mr. G. T. Watson, the gardener.

Wancote is situated on the southern slope of the well-known Hog's Back, and from the front of the mansion the view to the left is across Compton, famous for Watts Gallery and Memorial, over the Charterhouse at Godalming on to the Pitch Hill range of the North Downs. Immediately facing is Blackdown, famous for Aldworth, the home of Tennyson, while to the right is Hindhead and its foothills, with richly timbered, undulating country between.

The extensive flower-beds near the house are on platforms cut into the hillside, two or three terraces rising one above the other.

The members enjoyed a drive for six miles along the Hog's Back to Farnham, where tea was partaken; the journey home by Frensham ponds concluded a very enjoyable day.

### IRIS.

A GENERAL Meeting of the Iris Society, preceded by a dinner, was held at the Grosvenor Hotel, London, on Wednesday, May 4, when upwards of forty members and guests attended.

Mr. F. Kingdon Ward gave a short but very interesting account of his recent visit to China, illustrated by lantern slides. He described the conditions under which he found various Iris species, but said that few, if any, of them were likely to prove distinct from species with which growers are already acquainted. The districts he had traversed had been too wet for any but the moisture-loving species, and even of these he could relate no important finds.

After extending the thanks of the Society to Mr. Kingdon Ward for his entertaining lecture, the President, Mr. Geoffrey Pilkington, announced that the Committee had decided, subject to the approval of the meeting, to ask Mr. George Yeld to become the first English recipient of the "Foster Memorial Plaque." This is reserved "for special and personal award to anyone contributing to the advance of the genus."

The spontaneous enthusiasm with which this announcement was received was sufficient evidence of its popularity. In accepting this tribute to his life's work, Mr. Yeld spoke feelingly of his association with Sir Michael Foster, and of the epoch-making influence by him (Foster) on the development of Iris culture in Europe and America. Proud as he was of the honour the Society had conferred upon him, it could have come in no better form than in the excellent portrait in silver of the man upon whom he looked as a master, and of whom he was a humble disciple. "None of us would have done anything had not Sir Michael shown us the way."

Mr. Pilkington then sought the approval of the meeting for two further awards recommended by the Committee. The influence of Sir Michael he said, had been world-wide, and his name was honoured in America and France quite as much as in his own land. It was, therefore, hoped the meeting would approve the making of one award in America and another in France. The names suggested were Mr. J. C. Wister and Mr. S. Mottet. Mr. Wister is the President of the American Iris Society, through whom the English Society wished to pay a tribute to the excellent work done by the American organisation, and also to many individual workers in the United States, but above all, it was desired to recognise Mr. Wister's own indefatigable and enthusiastic work that had made him an outstanding personality amongst American Iris growers. With reference to Mons. Mottet, with whom many members of the Society were familiar, he needed only to point to his achievements in association with the firm to which he had been for so many years attached—Messrs. Vilmorin-Andrieux et Cie.—to justify any honour it was within the power of the Society to bestow. The meeting signified its unanimous approval.

After expressing the gratitude of the Society to Mrs. Phillip Runciman for the handsome Challenge Cup she had presented for competition at the forthcoming Iris Show, the President called upon Mr. R. W. Wallace to introduce the subject of awards of the Dykes Memorial Medal. With the easy eloquence for which he is so well-known, where the subject is one he has at heart, Mr. Wallace proceeded to draw a vivid and inspiring picture of the bonds that were being forged between England, France and America, by means of the Iris. Dykes' name was a household word amongst Iris lovers in all countries. He therefore proposed that a Dykes' Medal in silver-gilt should be offered each year in England, America and France for the purpose of which it was instituted, i.e., "the best new Iris of the year not hitherto in commerce." He pointed out that the result of this would be that in a few years when these new Irises had been distributed, they would eventually come into competition with each other in all three countries, with the result that it would ultimately be possible to select not only the best of each country, but also the best Iris in the world. He looked forward to the day when it would be possible, say, ten years hence, of having twenty "Dykes Medal" Irises for adjudication, and the possibility of making a

super award of the medal in gold to one of them.

The meeting having agreed, it was decided to offer one medal each year to the American Iris Society and the Société Nationale d'Horticulture de France, respectively.

After discussing various arrangements for the show to be held in the R.H.S. Hall, Vincent Square, on June 2, the meeting terminated.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

At the May meeting of this Society, held at the Royal Horticultural Society's Hall, Mr. Charles H. Curtis presided.

Four new members were elected and three members were allowed to withdraw from their deposit account sums amounting to £61 15s. 5d. The sum of £144 10s. 4d. was passed for payment to the nominees of two deceased members. The sick-pay for the month on the Ordinary side was £97 11s. 0d., and on the State section, £86 9s. 7d. Maternity benefits came to £2 10s. The sum of £44 11s. 6d. was made in grants for dental treatment to nine members, and thirteen other applications were considered.

### ROYAL CALEDONIAN HORTICULTURAL.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on May 3, Miss Burton, Vice-President, in the chair.

A paper was read by Mr. G. N. Smith, Newry, Ireland, on "The Grouping of Trees and Shrubs for Effect." In grouping, Mr. Smith said, much could be done by studious observation, nevertheless, excellent effects were frequently obtained without this, and he instanced a case of this sort where roots of the Plume Poppy (*Bocconia cordata*) had been accidentally left in the ground where *Prunus pissardi* and *Neillia opulifolia lutea* had been grouped, and where a fine effect had been produced by the unexpected development of the Poppy. He gave many examples of suitable combinations, both of flower and foliage, as well as of arrangements for seasonal effects, as, for example, a group of double-flowered Cherries with a cloud of *Spiraea arguta* underneath, etc. He stressed the use of Bamboos for the purpose, but for these plants ideal surroundings were necessary. They were, however, the evergreens *par excellence* for massing in open woodland. Trees and shrubs with golden foliage required to be associated with something warm or sombre in colour, so as to act as a foil.

The only exhibit was of *Tritonia Prince of Orange*, from Mr. D. ARMSTRONG, Drum Gardens, Edinburgh, for which he was awarded a Silver Medal.

### Obituary.

**William Hutchinson.**—We regret to learn of the death of Mr. William Hutchinson, for many years gardener to Major Galbraith, at Terregles, and subsequently in the employment of Messrs. Learmont, Hunter and King, of Dumfries, and recently with Mr. Thompson, Ecclefechan Nurseries, Dumfries. Mr. Hutchinson, who was well-known in the north, was sixty years of age, and is survived by his widow and two sons.

**Jakob Ochs.**—The death is recorded, in the German gardening press, of a very well-known German landscape gardener—or, as Continental usage has it, garden architect—Jakob Ochs, of Hamburg. Born in 1870, he acquired experience of various kinds before founding his business, which he did in 1896, with very little capital, but unbounded energy and enthusiasm. Generous to his employees, he was unsparing of his own strength, and was always the first to begin work and the last to leave off. He died on March 18, of an affection of the liver.

**Arthur Postle.**—It is with regret we record the sudden death of Mr. Arthur Postle, from heart failure. Born in Norfolk, he became garden boy

at Holywell Hall, Stamford, and afterwards gained experience in several other gardens in different parts of the country, eventually returning to take charge of the gardens where he commenced the business of life. He filled this position for thirty-eight years, and Col. Hood-Reynardson's gardens bore ample testimony to his skill and energy. A widow, three daughters and two sons mourn the loss of one who was held in high esteem by all who knew him.

## ANSWERS TO CORRESPONDENTS.

**DOUBLE DAFFODIL.**—*E. M.* The double flower is a very handsome one, and we do not remember having seen anything quite like it, as the yellow and cream-coloured segments are so distinct. It is a variety well worth perpetuating.

**EDIBLE CRESS.**—*E. T.* (1) The plant you send is *Barbarea verna*, of Acherson, and is sometimes named *B. praecox*, of R. Brown. It is known in gardens as American Cress, and is edible, being obtained in the form of seeds from the seedsmen to furnish Cress for salads in winter. It is a European species, an escape from gardens in this country, and only an introduced plant in the United States. You can distinguish it from all other species in Britain by the long and few pods on a given length of stem, and by the short stalks to the pods, almost as thick as the pods themselves, as well as by the numerous narrow segments to the leaves of the stem. The plant is best grown as an annual to get the leaves the first year before it flowers. Sow the seeds thinly now. (2) The purple flower is *Cardamine pratensis*, or, if you care to be critical, call it *C. p. palustris* (Lady's Smock or Cuckoo Flower). It could not have come from *Barbarea verna*, being a common British plant that grows in damp places. It produces seeds freely, which the type of *C. pratensis* does not.

**FIGS UNHEALTHY.**—*Correspondent.* We failed to find any disease present, either on the Fig leaves or fruit sent for inspection, and think either the border or cultural conditions are at fault, as the leaves are soft and thin in texture. Figs will fruit well in a very poor rooting medium, provided the trees are neither checked by drought nor swamped at the roots by cold, stagnant moisture. The latter condition appears to be your trouble judging from the appearance of the leaves. Elevate the border or excavate it to the depth of the drainage next autumn, and allow one square foot of border to every square yard of trellis. Mix the soil with burnt earth, broken bricks and old lime or plaster rubble. Figs enjoy plenty of heat and moisture, provided the drainage is efficient and the roots healthy, but in a season like the present it is easy to create a too cold, stagnant atmosphere which favours gross growth, and only by lifting and root-pruning the trees, using the materials mentioned in the soil, can this tendency be corrected.

**INSECTS ON POPLAR TREES.**—*H. L. D.* From what can be seen from the scrapings of bark received for examination, the Poplar trees are affected by a species of aphid. All that can be done is to spray the bark on several occasions, at intervals of a few days, with a paraffin wash.

**LEATHER JACKETS IN A NEW ROCKERY.**—*G. W. B. G.* The presence of leather jackets in the soil points to the use of turf by the makers, and this would be splendid rooting material when the grass has decayed thoroughly. It is unfortunate that the leather jackets are present, but they will develop into the perfect fly stage known as Daddy Longlegs in the summer, and not be likely to trouble you again, for the female Daddy Longlegs lays her eggs in grass.

**MEALY BUG ON HIPPEASTRUMS.**—*H. N. G.* Nothing but persistent attacks upon the mealy bug will remove the pest from bulbs of

*Hippeastrum*. All the rough and dead portions of the scales should be removed and the bulbs cleansed with a fairly strong insecticide applied by a moderately stiff brush. As growth appears, the appearance of the pest must be watched for carefully, and any seen should be touched with a small brush dipped in methylated spirit. When the bulbs are entirely dormant more drastic measures may be taken to eliminate the trouble.

**MUSCAT OF ALEXANDRIA VINE LEAVES SCORCHED.**—*H. W.* The scorched appearance of the vine leaves cannot be traced to infection by disease organisms. It is, however, frequently associated with root trouble, and we suggest that you should make careful examination of the root system, because it is possible that the soil is either dry or deficient in plant foods. Dryness at the root can be corrected immediately by suitable applications of water, but, if the soil is poor, you will have to wait until the resting period, when a portion of the soil about the roots should be carefully removed and a good vine compost substituted.

**NAME OF FRUIT.**—*W. H. C.* Apple Bedfordshire Foundling.

**NAMES OF PLANTS.**—*L. S.* *Corema album*. *X. L.* 1, *Lonicera tatarica*; 2, *Vaccinium corymbosum*. *R. R.* *Exochorda grandiflora*. *H. B. W.* The plant is *Tolmiea Menziesii*, allied to *Heuchera*, *Tiarella*, etc. *G. K.* Fruit-stems of *Equisetum arvense*.

**RUST ON BERBERIS (MAHONIA) PLANTS.**—*G. S.* The Mahonia sprays are attacked by the Rust fungus, *Puccinia mirabilissima*, an American species which was first observed in Britain in 1922 (being recorded by Malcolm Wilson from near Edinburgh in *Transactions of the Botanical Society, Edinburgh*, XXVIII, p. 164). This fungus is not related to the Rose Rust, and no fear need be entertained of it affecting your Roses. In addition to the treatment already given to the Rose beds, it would be advisable to look over the Rose bushes carefully for orange-red patches of spores bursting through the back of last year's wood or covering the young buds, and remove these carefully. The orange-red patches of spores usually appear on certain varieties only, and develop from the middle of April to the end of May.

**SCLEROTIA IN SOIL.**—*A. G.* The black, seed-like bodies in the soil are the sclerotia of *Rhizoctonia Solani*. High temperatures, over-watering, excessive feeding and deep-planting favour the disease in certain greenhouse plants. Sterilization of infected soil by steaming or baking, or with a twenty per cent. solution of formaldehyde (one gallon of commercial forty per cent. pure formaldehyde in forty-nine gallons of water) has been recommended as efficacious in getting rid of this disease.

**SILKY FIBRE FROM TREE.**—*T. A. D.* In the absence of material suitable for correct identification, it would appear that the fibre received for determination is that of the Silk Cotton Tree (*Eriodendron anfractuosum*). This tree is found in Tropical Asia and Tropical Africa, and is cultivated elsewhere. The silky floss surrounding the seeds is usually regarded as unsuitable for spinning purposes, but it is used a good deal in the upholstery trade as a stuffing material under the name of "Kapok." It has the peculiarity of being very buoyant, and is used in certain kinds of life-saving apparatus. Further, the fibre does not mat together and form lumps as in the case of some stuffing materials. A good deal of the fibre used in commerce is collected in Java and India. If the seeds were sown in a warm greenhouse there should be no difficulty in getting them to germinate and form small trees, but it is unlikely that they would bear fruits.

**Communications Received.**—*W. J. S.*, Thanks for 2/- for R.G.O.F. Box.—*A. R. H.*—*J. C. A. C.*—*F. J.*—*A. R.*—*W. S.*—*A. G.*—*H. E.*—*P. C. G.*—*H. C.*—*n. G.* and *C.*—*M. J. W.*—*R. J. W.*—*T. V.*—*J. W. B.*—*W. A.*—*W. H.*—*J. G. W.*—*F. D.*—*C. D. D.*—*J. G. S.*

## NEW HORTICULTURAL INVENTIONS.

THESE particulars of New Patents, of interest to readers, have been selected from the Official Journal of Patents, and are published by special permission of the Controller of H.M. Stationery Office.

261,346.—Grant, C. L. W.—Garden trowels and other garden tools.

Printed copies of the full Published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2., at the uniform price of 1/- each.

### Abstract Published.

#### TOPPING BEET, ETC.

A simple machine for topping Beets and other roots has been designed by Mr. J. P. Humphreys, of 19, Preston, Wellington, Shropshire, under Patent No. 265,776. The apparatus is hand-worked, and one can deal with a surprising number of roots in a short while. The Beet, etc., to be topped is placed in a recess in a block and is cut by a knife attached to a lever actuated through a pin and slot connection by a hand-lever, which, if necessary, can be worked off a treadle. A slot is formed in the block to receive the knife so that no accident can happen when unattended.

## THE LATEST TRADE MARKS.

THIS list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

### KENBAR.

478,766.—Agricultural and horticultural machinery, and parts of such machinery.—John Barker and Company, Limited, 83, Kensington High Street, London, W.8. April 20.

## GARDENING APPOINTMENT.

**Mr. E. J. Barnard**, for six months gardener to Capt. and Mrs. BACHE HAY, at Appletree House, Byfield, Northants, as gardener to the same lady and gentleman at Culworth House, near Banbury, Oxon. (Thanks for 1/- for R.G.O.F. Box.—*Ebs.*.)

## MARKETS.

COVENT GARDEN, Tuesday, May 17th, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDB.

	—pink ... 8 0-10 0

REMARKS.—Narcissus Poeticus is practically finished for the season. Double White Narcissus advanced in price from 3/- on Thursday to 5/- and 6/- before the market closed on Saturday, and prices remained firm to-day. Good prices are still maintained for double white Stock from home-growers. The first consignment of double white Pyrethrum from France has been received in good condition, and these flowers should meet with a good demand during the next few days, as white flowers of this type are scarce. Coloured varieties of Pyrethrum, both single and double, are now being received from home-growers. Sweet-scented Paeonies are already arriving from the South of France in good condition and should meet with a brisk demand; other blooms received from France are Gypsophila elegans, Statice sinuata, yellow Marguerites and white Pinks. All Roses have become dearer owing to the colder weather, and the shortage is likely to last for a few days. Prices have advanced according to the demand during the past week. Tulips are now almost finished, and prices are advancing for best blooms. Spanish Irises from home-growers are arriving in good condition. Of Gladioli, The Bride (white) is the best; more of the coloured varieties are being received from Guernsey. Cornflowers, Sweet Peas and the few Coreopsis on sale are much improved in quality.

	Turnips, per cwt. 4 0-5 0

REMARKS.—The quantities of produce being handled are quite up to expectations for the time of year, for while the demand in some sections is not particularly good, there is a keen inquiry in most. Australasian Apples are an important feature just now and, on the whole, they are selling well. Grapes from the same source, are also popular, as are those that are still coming from South Africa, whence Pears and Quinces are also arriving. English Gooseberries are in better supply and are meeting with a good demand. Tomatoes show a considerable increase in quantities and are accordingly quoted cheaper. The Cucumber trade is at the moment slow. French Beans are a better trade, in spite of increasing supplies of English Asparagus. Hothouse Peas are more plentiful and cheaper. New Potatoes from Jersey, St. Malo and Guernsey and Scilly are plentiful and cheap. Mushrooms have been in heavy supply lately, but their prices have kept up very well. Salads and all green vegetables are cheap.

## GLASGOW.

Cut flowers continued to be cheap, and Tulips in particular were plentiful. William Saunders, Clara Butt, Wm. Copland and Bartigon varieties were worth from 3d. to 5d. per dozen, while prices of Daffodils ranged as follows: Emperor, 2/- to 2 6/- per doz. bunches; Barril conspicuus, 1/- to 1 3/-; Pheasant's Eye, 1/- to 2 6/-; recurvus, 1 3/- to 2/-; and double white, 7d. to 10d. per bunch. Guernsey Irises made 3d. to 5d. (6's); English-grown Emperor, 1/- to 1 3/4 (12's); Rembrandt, 9d. to 1/-; and yellow, 1/- to 1 3/4. Carnations were slow to move at 1 9/- to 2 6/- per dozen. Lillium longiflorum (Harrisii) and Richardias (Arums) averaged 2/- to 2 6/- per dozen. Pink Roses realised 2/- to 3 6/- per dozen; small red Roses, 1/- to 2 6/-; white Roses, 1 6/- to 2 6/-. Anemones were worth 2/- to 4/- per dozen bunches; special quality, 4/- to 6/-; Sweet Peas realised 1/- per bunch; Lily-of-the-Valley (outdoor), 3d. to 6d.; and Paeonies, 10d. to 1 3/4.

Bedding plants were in excessive supply. Coltness Gem Dahlia sold at 3 6/- per dozen; Marguerites at 3/- per dozen; Violas at 1 6/- per box; Lobelia, 1/- to 1 6/- per box; Stocks, Asters, Antirrhinums and Alyssum, 1/- to 1 3/- per box; and Calceolaria, 1/- per dozen.

Apart from an advance in the price of Oranges, the dealings in the fruit market were featureless. Prices for Valencia Oranges, 420's, varied from 26/- to 32/-; 300's, 20/- to 26/-; 360's, 16/- to 22/-; 240's and 200's, 18/- to 26/-. Grape Fruit was scarce and dear at 30/- to 40/- per case. Newtown Pippin Apples realised 14 6/- to 17/- per case. Winesap Apples, 11/- to 14/-. Australian Pears (Beurré Bosc and Beurré Magnifique) realised 8/- to 10/- per tray; and Palermo Lemons, 300's, 15/-.

In the vegetable section, Scotch Tomatoes commanded 2 6/- per lb; Guernsey Tomatoes, first grade, 1 1/5; second grade and rough, 1/- to 1 3/4; English Cucumbers, 4 6/- to 6/- per dozen; Scotch Cucumbers, 7/- to 8/-; Lettuce, 1 9/- to 2/- per dozen; Dutch Cauliflowers, 3/- to 7/-; Cabbages, 1/-; Asparagus, 9d. to 1/-; Maltese Potatoes, (round), 16/- per cwt.; Kidney Potatoes, 19/-; and Tene-riffe Potatoes, 16/- and 17/- per case.

## TRADE NOTES.

ONE of the pleasantest things in business is when the demand for a high-class article becomes so great that by making it on a larger scale prices to customers can be reduced. The popularity of the greenhouses made by the firm of Boulton and Paul, Ltd., has been so great that they are enabled to announce reductions in their lean-to greenhouses from £15 to £14 5s. 0d., and in their span-roof greenhouses from £18 10s. 0d. to £17 0s. 0d.

READERS requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

**SITUATIONS VACANT**

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

**MUNICIPAL AND PUBLIC.****SOMERSET COUNTY COUNCIL.**

Appointment of **HEAD GARDENER** and **INSTRUCTOR** (Male), at The Somerset Farm Institute.

**APPLICATIONS** are invited for the above appointment from men who must have had a wide experience of general horticulture and especially in the cultivation of fruit and vegetables for market. Experience of teaching and lecturing is desirable.

The officer appointed will be required to work under the direction of the Horticultural Superintendent and to give practical gardening instruction to pupils, also to assist with class-room lectures and to deal with sales of produce.

Salary £165 per annum.

The appointment will be a designated post under the Local Government and Other Officers' Superannuation Act, 1923, and the person appointed must pass a medical examination.

Applications, which should be made on a form obtainable at the address below, and be accompanied by copies of not more than three recent testimonials, must be delivered not later than Friday, May 27th, 1927, to **THE PRINCIPAL**, Somerset Farm Institute, Cannington, Near Bridgwater.

**ADMINISTRATIVE COUNTY OF LONDON.**

**THE** London County Council in vite applications for the position of **COLLECTOR** (to assist in the collection and packing of botanical specimens) on the staff of the Botany Scheme, Avery Hill, Eltham, S.E.9.

Scale of Pay, 30/- a week, rising by annual increments of 2/6 to 40/- a week, and temporary additions, making the total commencing rate of pay 54/- a week at the present time, subject to periodical revision according to the cost of living.

Applicants should not be more than 35 years of age; should possess botanical qualifications, and should have had training in gardening in which two years should have been spent at a recognised horticultural school.

Other things being equal, preference will be given to those who have served, or attempted to serve, with the Forces of the Crown.

Apply to the **EDUCATION OFFICER** (Staff), the County Hall, Westminster Bridge, S.E.1 (stamped addressed foolscap envelope necessary) for form of application to be returned not later than 4th June, 1927.

Canvassing disqualifies.

**MONTAGU H. COX.**

Clerk of the London County Council

# SITUATIONS WANTED

Twenty words **2s.**, and **6d.** for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, **1s.**, over and above the amount payable for all words appearing in the advertisement, including our own address.

## SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## MUNICIPAL AND PUBLIC.

**YOUNG MAN**, 25, seeks responsible post where botanical work is needed; 9 years' experience, British plants, Alpine, hardy shrubs and herbaceous, and glasshouses; married when suited.—Write, **M. C. S.**, Box 44, 5, Tavistock Street, Covent Garden, W.C.2.

**AVERAGE MEAN TEMPERATURE** for the ensuing week deduced from observations during the last fifty years at Greenwich, 57.6°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, May 25, 10 a.m. Bar. 30.8. Temp. 58°. Weather, Sunny.

THERE are few more valuable and few more neglected Government publications than the *Agricultural Statistics*, published each year by the Ministry of Agriculture. Their value lies in this, that they give a picture—in dull, and at times sombre tones—of the vicissitudes of British agriculture. The statistics afford also a grim, if indirect, commentary on the difficulties which climate imposes on our farmers. For although it is true that our climate is such as to allow of a vast variety of cultivation, yet its capriciousness is apt to destroy in detail what it encourages in bulk. Thus in 1926—the year with which the Report deals—Potatoes were grown on just short of half-a-million acres, an area which has only rarely been exceeded. The grower, up till July, could look with some confidence to a large crop; but bad weather disposed of all hope of a good crop, and disease which followed in consequence of a wet summer, reduced yields to the poor average of 5.5 tons to the acre, so that only some two-and-three-quarter million tons were harvested. How far this low yield might have been mitigated by opportune spraying is hard to say; but it is probable that some considerable saving of the crop might have resulted. Unfortunately, wet spraying is a somewhat expensive operation, and our

farmers are apt to neglect this form of insurance. Efforts made during the war years to encourage spraying were, for the moment, successful, but the operation has never become a routine part of Potato growing here, as it has in Ireland. It is possible that more success would attend attempts to encourage dry spraying. It is interesting in connection with this crop to note that according to the Report, allotment holders cultivated in 1926 some 80,000 acres of Potatoes, with a production estimated at nearly half-a-million tons. The most striking statistics in the Report are those relating to Sugar Beet. Over 125,000 acres were devoted in 1926 to this crop, chiefly in Norfolk and Suffolk, which, between them, grew almost 60,000 acres of Beet. The yield was a little over a million tons, and showed an average of about eight-and-three-quarter tons to the acre, which average is bound to be raised with each year's experience of this new crop. The labours of farmers are like those of Sisyphus, unending, and some of them, at all events, are apt to be made as vain. Apples, for example, which are grown on nearly a quarter-of-a-million acres, were so ruined in 1926 by spring frosts, that each tree on the average gave the puny yield of 10½ lbs., and a total production of so little as 1,166,000 hundredweights. Pears which are less suitable to our climate did better, and gave an average yield of 2½ lbs. and Plums for once had a moderately good year with a yield of nearly 30 lbs. per tree. This market garden of ours grows wide and increasing breadths of vegetables and small fruits: Cabbages, 25,000 acres and more; Brussels Sprouts, a like area; Cauliflowers and Broccoli, about half as many acres; Rhubarb, a mere 6,000 acres, but of Strawberries, no fewer than 26,000 acres; Raspberries, 6,680 acres. Black Currants, 12,000 acres and Gooseberries, 17,000 acres—a vast range, and no mean extent of cultivations. The net effect is to ensure the nation from sending many millions of pounds abroad, and to bring but little profit on the average to the material produced. Yet, despite hard times, farmers continue always hoping with incorrigible optimism, for better times. For our part, we think that their hope will at last be justified, and that the stubborn fight they have put up against recent hard times will have its reward. This is the darkest hour that they have known for many a year—may it prove to be that darkest of hours that precedes the dawn!

**Prizes for an Essay on Carnations.**—The British Carnation Society is offering three prizes for essays on "My Favourite Carnations—and Why." The competition is open only to members of the British Carnation Society, and the essays must be signed with a nom-de-plume, and reach the Secretary not later than August 31, 1927. It is proposed to publish the three essays in *The Carnation Year Book*, 1927, and the Committee reserves the right to publish any of the others, wholly or in part, in 1927 or a future issue of the *Year Book*.

**Bearded Irises.**—Mr. George Yeld, V.M.H., sends us the following note on the forthcoming show of the Iris Society in the R.H.S. Hall, Vincent Square, Westminster:—"The Iris Society, whose numbers have largely increased, holds its first show at Vincent Square, in the R.H.S. Hall, on June 2. The schedule offers to exhibitors many classes and many rewards—a silver challenge cup, offered by Mrs. Philip Runciman; a Veitch memorial medal, offered by the R.H.S.; and The Dykes Medal, offered by the Iris Society itself. There should be a goodly variety of flowers to be seen, and an

opportunity will thus be afforded to those who desire to acquire an up-to-date knowledge of the advances made in colour, 'stance', and fragrance. I may point out some of the Irises, which in the opinion of experts, hold a high place: *Germaine Perthus*, *Le Corregge*, *Solferino*, *Labor*, *M. Cornault*, *Mme. Cecile Bouscant*, and *Ophelia*, among the French novelties; *Morning Splendour* and *Sir Galahad* amongst the American-raised varieties; and *W. R. Dykes*, the famous yellow Iris, *Mrs. Robert Emmett*, and *Miss Grace Sturtevant* among the English-raised sorts. Of the older, but still comparatively new varieties, the following should be looked for: *Ambassadeur*, *Mdlle. Schwartz*, *Souvenir de Loetitia Michaud*, *Lent A. Williams*, *Shekinah*, *Queen Caterina*, *Seminole*, *Peerless*, *Bruno*, *Romola*, *Mrs. Marian Cran*, *Mary Gibson*, *Ann Page*, *Aphrodite*, *Asia*, *Leonato* and *Amber*. To those who propose laying out an Iris garden, I would suggest the advisability of planting white and yellow varieties among the darker ones. One American writer recommends one white or yellow sort to every three of darker colours. Unfortunately, whites are, as a whole, hardly up to the quality of the darker colours. Planters should, therefore, scan the exhibits carefully for white and yellow flowers."

**Official Inspection of Growing Crops of Potatoes in Scotland.**—The Board of Agriculture for Scotland is prepared to undertake the inspection of Potato crops during the growing season with a view to the issue of certificates or reports for the assistance of growers or merchants in complying with the requirements of (a) the Wart Disease of Potatoes Order, 1923, of the Ministry of Agriculture and Fisheries which governs the importation of Potatoes into England and Wales, and (b) the Seeds Act, 1920, and the Regulations issued thereunder. As a general rule, application should not be made for the inspection of any crop unless it extends to a quarter-of-an-acre or more, but special consideration will be given to growers who have small stocks of new or scarce varieties. Certificates will be granted in respect of growing crops of immune varieties which attain a standard of purity of not less than 99.5 per cent. These certificates will be numbered in a series, and the numbers will be prefixed by the letters "T.S.," (denoting True Stock). Reports will be issued in respect of other growing crops, stating the percentage of purity within the following grades:—Grade "B": Less than 99.5 but not less than 97 per cent; "Mixed": Less than 97 per cent. Reports will also be issued in respect of growing crops of non-immune varieties, stating the percentage of purity within the following grades: Grade "A": Not less than 99.5 per cent; Grade "B": less than 99.5, but not less than 97 per cent.; Mixed: Less than 97 per cent. In addition to the above certificates and reports, the Board will issue special "Stock Seed" reports in respect of crops of both immune and non-immune varieties which are found on inspection during the growing season and at lifting to attain an exceptionally high standard of purity and appear to be free from disease (excluding Pit Rot and Blight). A crop will not be regarded as suitable for a "Stock Seed" Report unless it is the only crop of Potatoes in the field or, if there is more than one crop, the varieties are separated by at least two rows of Turnips or by any crop other than Potatoes, and there are no Potatoes in the headrigs.

**Edinburgh Royal Botanic Garden Guild.**—This Guild is an Association of those who have been employed in the Royal Botanic Garden, Edinburgh, or who hold or have held positions of responsibility there, an association similar to the Kew Guild, and like the latter, publishes a *Journal*, of which Part III of Vol. 1 is before us. The frontispiece is an excellent portrait of Professor W. Wright Smith, F.L.S., the President, and the portrait is accompanied by a short biography. Professor W. Wright Smith succeeded the late Sir Isaac Bayley Balfour as Regius Professor of Botany at the University of Edinburgh and Regius Keeper of the Royal Botanic Garden. The text includes accounts of the annual general meeting in 1926, the

financial statement, and much concerning individual members; also several letters from old members dealing with such subjects as the Cruickshank Botanic Garden, Old Aberdeen; Gardening in America; Impressions of Malaya; and Beauty of the Braid Burn. There is a list of the present staff of the Royal Botanic Garden and of members who have been connected with the garden in the past. Amongst the latter we notice many well-known names in the horticultural world, including Mr. W. Cuthbertson, J.P., V.M.H., Mr. G. Forrest, V.M.H., Mr. T. Hay, Superintendent of Hyde Park; Mr. D. Murdoch of Holyrood Palace Gardens, Edinburgh; Mr. R. Notcutt, nurseryman, Woodbridge; Mr. G. M. Taylor; Mr. A. D. Richardson; Mr. J. Christie, Superintendent of Camberwell Public Parks; and Mr. W. Hepburn, Superintendent of Greenwich Park.

**French Site-Planning Competition.**—A fourth competition is being arranged by the Lyons "Beautification Society" in which prizes are offered for the best suggestions for the laying out of the unoccupied land lying at the junction of the Rhône and Saône. Competitors are given full latitude as regards the manner of utilising the ground, and are at liberty to allow their imaginations to range at will among gardens, squares, buildings of all kinds, industrial or other dwellings, and public offices. In the event of any of the competitors planning a Rosery, it is to be made large enough to contain at least two thousand varieties, and to include a house large enough for a park-keeper and his family. As, however, the ground is very exposed both from north and south, some sort of shelter would probably be necessary. The competition is apparently open only to French entrants.

**British-raised Hydrangeas.**—Mr. T. Vallance (see page 347) of West Lodge, Greenfield House, Alloa, informs us that he saved seeds from cross-fertilised Hydrangeas in 1914, sowed them in 1915, and flowered the seedlings in 1916. He states that all the white seedlings were the merest weeds, but some of the coloured sorts were quite good. He adds, "I have been saving seeds since I was at school and know now that many of the crosses made were impossible ones; for instance, I endeavoured to cross *Clanthus Dampieri* with the pollen from Sweet Peas, and vice versa; and to cross Sweet Peas with the pollen of the yellow Trefoil and yellow Broom in the hope of getting a yellow Sweet Pea. At present I am crossing and intercrossing *Cyclamens* and, in passing, would observe that, in my opinion, *Cyclamens* should not be shaded unless in flower, but I am experimenting in this connection."

**The Fairchild Lecture.**—The annual "Thomas Fairchild" lecture will be delivered at Shoreditch Parish Church on Wednesday, June 8, at 5 p.m., by the Rev. Richard Hanson, M.A., B.D., Lecturer in Dogmatic Theology in King's College, London. The lecture is held under the auspices of the Worshipful Company of Gardeners and takes its name from Thomas Fairchild, of the Parish of St. Leonard, Shoreditch, in the County of Middlesex, Gardener and Clothworker of London, who, by his will dated the 21st February, 1728-9 (which was duly proved on the 23rd day of October, 1729), "gave and bequeathed to the Trustees of the Charity Children of Hoxton and their successors and the Churchwardens of the said Parish of St. Leonard, and their successors, the sum of £25 to be by them placed out at interest for the payment of 20/- annually for ever for the preaching of a sermon in the said Church of St. Leonard, Shoreditch, by the lecturer of the said parish or such other person as the said Trustees and Churchwardens and their successors should think proper, in the afternoon of the Tuesday in every Whitsun week in each year on the subjects following, viz.: 'The wonderful works of God in the Creation,' or on 'The Certainty of the Resurrection of the Dead, proved by the certain changes of the animal and vegetable parts of the Creation.'" Invitations to attend are being sent to the Ministry of Agriculture, the Royal Society, the Worshipful Company of Clothworkers, the Royal Horticultural Society, the Royal Botanic Society of London, and the

Shoreditch Borough Council. The company will assemble in the Church Room, adjoining Shoreditch Church, at 4.45 p.m., and will be met by the Vicar, the Rev. F. E. Birch, M.A., and enter the church in procession. Prior to the assembly, the company will deposit a garland of Laurel on Thomas Fairchild's tomb in the public recreation ground on the west side of Hackney Road. The church is about five minutes' walk from Old Street Tube Station, and a tram from that station passes the church doors, whilst motor omnibuses from most parts of London and trams from Liverpool Street stop near to the church.

**Southport Flower Show.**—The Schedule of the fourth annual Southport Flower Show, to be held on August 24, 25 and 26 next, has just been issued. Prizes to the value of over £4,000 will be offered; they include many new trophies and the *Daily Mail* £100 Gold Challenge Cup for the best-scented Carnation registered with the British Carnation Society will again be competed for. Amongst the numerous interesting classes in

SIR HENRY WHITEHEAD.  
Chairman of the Royal Gardeners' Orphan Fund Festival  
Dinner on the 20th inst.  
(see p. 384)

the schedule are the Open Championship Classes for a decorated table of fruit and for a collection of twelve distinct kinds of vegetables, respectively. Rook and water gardens are a great feature of these Southport shows, and it is anticipated that, with the additional ground which is being prepared for non-competitive formal gardens this year, this section of the show will be better than ever. In addition to the Great Marquee—which will be still further enlarged and will occupy about 11,000 square feet more than at the 1926 show—there will be two other tents. Gold and silver medals and Certificates of Merit will be offered for horticultural sundries in thirty classes. Last year the provincial show of the National Rose Society was held in connection with the Southport show, and this year, the thirty-third exhibition of the British Carnation Society will be held at Southport. The Carnation Society's classes are incorporated in the schedule of the Southport show, copies of which may be obtained post free from the Secretary, Southport Flower Show, Town Hall, Southport.

**Watercress from a Hot-bed.**—A German correspondent of our contemporary *Die Gartenwelt* (Berlin) states that he has successfully cultivated Watercress (*Nasturtium officinale*) on a hot-bed, and adds that this method is much simpler than cultivation in running water. The method he adopted is to obtain seeds of the best Erfurt Watercress in July, and sow

them in a shady place, well watering the plants when they appear. When strong enough, they are transplanted to a well-rotted hot-bed, and again well-watered, after which they can be left awhile uncovered. After the lights have been closed, the leaves soon become tender and delicious, and there will be a succession for a considerable period, especially if a warm covering can be provided, and the frames closed against frost. It is stated that even better results may follow if the Watercress is cultivated in a frame heated by hot-water, when a succession may be obtained the whole winter through.

**The Iris Society Prize Fund.**—In connection with the Iris Society's first show on June 2, at the R.H.S. Hall, the following awards will be available: The Royal Horticultural Society has kindly offered the Veitchian Medal; the American Iris Society has offered one Silver Medal; the Iris Society's Medal in silver-gilt and bronze will be available; and the Dykes Memorial Medal will be open for award this year. In addition to these, cash prizes are offered, and it is felt desirable that the ordinary funds of the Society should not be encroached upon more than is absolutely necessary for this purpose and for other expenses in connection with the show, such as advertising, printing, etc. The total amount required is £36. Although the trade members of the Society have generously agreed to guarantee this fund up to £25, it is hoped that by the wholesale support of members it will not be necessary to call upon them to fulfil this guarantee. In addition to the awards mentioned, Mrs. Phillip Runciman has kindly presented the Society with a fine silver Challenge Cup.

**Vegetable Alkaloids.**—At the meeting of the Association of Economic Biologists, on May 13, Lt.-Col. A. T. Gage, C.I.E., stated that alkaloids are yielded chiefly by the following plants: *Aconitum Napellus*, L. (Aconite); *Berberis aristata*, DC. (Berberin); *Papaver somniferum*, L. (Morphine and other alkaloids); *Camellia Thea*, Link. (Caffeine); *Theobroma Cacao*, L. (Theobromine); *Erythroxylum Coca*, Lamk. (Cocaine); *Pilocarpus pennatifolius*, Lem. (Pilocarpine); *Physostigma venenosum*, Ball. (Physostigmine or Eserine); *Conium maculatum*, L. (Conine); *Cinchona*, various species, (Quinine and allied alkaloids); *Coffea arabica*, L. (Caffeine); *Psychotria Ipecacuanha*, Stokes. (Emetine); *Strychnos Nux-vomica*, L. (Strychnine); *Nicotiana Tabacum*, L. (Nicotine); *Datura Stramonium*, L. (Daturine); *Atropa Belladonna*, L. (Atropine); *Hyoscyamus niger*, L. (Hyoscamine); and *Claviceps purpurea*, Tul. (Ergotamine). Dr. T. A. Henry stated that during the century that has elapsed since the discovery of the first alkaloid morphine, great progress has been made in our knowledge of these indispensable drugs. Such well-known alkaloids as Cocaine and Atropine have been made in the laboratory, the synthesis of Quinine and the related Cinchona alkaloids may be expected at any time, and except in minute details, experts are now agreed as to the structure of even such a difficult alkaloid as Morphine. Though supplies of alkaloids are still drawn wholly from natural sources, neither scientific curiosity nor the practical possibility of increasing and cheapening supplies has led to the same intensive study of the bio-chemistry of alkaloids and virtually nothing is yet known regarding either the methods by which alkaloids originate in plants, or the part they play in plant physiology. Dr. Trevan discussed the medical aspects of the plant alkaloids.

**Scholarships for Agricultural Workers.**—The Ministry of Agriculture has published a report on the scheme of scholarships for agricultural workers, and states that those in Class 2, i.e., for two-year diploma courses at agricultural colleges and other courses at farm institutes and similar institutions respectively, have benefited by the scheme, many having already substantially improved their positions. One of the scholars, formerly a working gardener, is now a horticultural instructor, and another working gardener is head gardener and gardening instructor at a farm institute. Most of the

scholars in Class 2 have obtained national diplomas in addition to college diplomas. At the date of the Committee's Report, 355 Class 3 students had completed their courses, of whom 294 gained the certificates or diplomas issued by the institutes, 102 obtaining first-class certificates or certificates with distinction, and no fewer than 28 of the students securing first places in the courses. There were five gold medallists, one silver medallist, and a number of other prize winners.

**Austrian Horticultural Centenary.**—The Centenary Exhibition of the Austrian Horticultural Society was held from April 28 to May 4 in the Wiener Neue Hofburg, the former Imperial Palace, the halls of which were transformed for the time being into a fairyland of flowers and foliage. The arrangements were excellently made, and great taste was displayed both by the organisers and the individual exhibitors in making everything harmonise one with another, and with the decoration and style of the different rooms. In the first hall was a striking group—a statue by the well-known Vienna sculptor, Hanak, "The Burning Man," stood in a great mass of Azaleas, while white Rhododendrons formed a background to the group. In another room were ripe Cherries, side by side with trees still in bloom. A wide red carpet was, on closer inspection, found to be formed of closely laid, scarlet Strawberries. Japanese garden art was represented by a garden complete with imported dwarf Conifers and Oaks; and a Mexican landscape offered a suitable background for a group of Cactaceous plants. Giant blue and red Hydrangeas filled another hall, and the art of the florist was displayed in a separate exhibition. A room was set aside for the display of garden plans and sketches, including an interesting design for laying out the Vienna town park in the newest American style. Perhaps the greatest attraction in the Exhibition was the Japanese garden shown by the firm of Gessl, Vienna; but much interest was also shown in the Anthuriums, Schizanthuses, Codiaeums, Dieffenbachias, Calceolarias and forced fruit from the Rothschild gardens. So great was the number of visitors that at one time it was necessary to stop the entrance of any more, as the crush in the halls was considered dangerous. Besides local visitors there were great numbers from Germany, notably from Cologne, and from Baden and Württemberg.

**Appointments for the Ensuing Week.**—**MONDAY, MAY 30:** Romsey and District Gardeners' Association's outing. **WEDNESDAY, JUNE 1:** Nottingham and Notts. Chrysanthemum Society's meeting. **THURSDAY, JUNE 2:** Iris Society's show. **FRIDAY, JUNE 3:** Accrington and District Chrysanthemum Society's meeting; British Mycological Society's Spring Foray at Marlborough (five days). **SATURDAY, JUNE 4:** Darwen and District Agricultural Association's show; Blackburn and District Horticultural Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—**Sale of Conifers.**—Messrs. Loddiges' first sale took place at Stevens's on Tuesday last. It was confined to hardy Conifers in pots. Some idea of the kind of prices they realised may be gleaned from the following: Lots consisting of *Abies* (*Picea*) *apabilis*, *Pinus* *Wincesteriana*, and other good varieties, 4/-; *Abies* (*Picea*) *grandis*, *Abies* (*Pinus*) *Pinsapo*, and others, 5/6; *Abies grandis*, *diffusa*, and others, from 5/6 to 7/6; *Abies grandis*, *Pinus* *Lambertiana*, and others, 5/-; other lots fetched from 5/- to 12/- each lot. *Gard. Chron.*, May 29, 1852.

**Publications Received.**—*Gardening in Town and Suburb*, by Doreen Joad; The Labour Publishing Co., 38, Great Ormond Street, W.C.1; price 2/6, cloth; paper, 1/-.—*Consider the Lilies*, issued by W. E. Marshall and Co., Seedsman and Plantmen, 150, West 23rd Street, New York.—*Plant Autographs and their Revelations*, by Sir J. C. Bose; Longmans, Green and Co., Ltd., 39, Paternoster Row, E.C.4; price 7/6 net.—*The Gardeners' Colour Book*, by John Fothergill; Alfred Knopf, 38, Bedford Place, W.C.1; price 5/-.

## INDOOR PLANTS.

### HYDRANGEAS FROM SEEDS.

THE initial success obtained by Mr. H. J. Jones with his seedling Hydrangeas at Vincent Square, on April 26, has aroused much interest among gardeners. We began crossing Hydrangeas at Chorley Wood in the summer of 1925, at the same time Mr. Jones did at Lewisham, although neither of us knew what the other was doing.

The true flower of the Hydrangea is a very small affair; the large bracts provide the attraction. There is usually one large female flower to each little twig of the flower-head, and this is in the centre. Fertilisation should be done early—so soon as the small flower is fully open; after fertilisation the flower-head should be allowed to remain on the plant until well into the autumn. I have had some remarkable colour effects in these old flower heads kept for seed. A plant of Viking last year carried two large heads which turned from pink to green and then to a rich blood-red, this last colour remaining for a month.

The flowers of some varieties are more easily fertilised than others, but if sturdy plants of a

ally, but some varieties show a trace of mauve and in this connection a curious point has arisen. Pots that have contained "blued" plants and soil should be used only for the blue class, because it would appear that a certain proportion of iron (?) will remain in the porous pottery-ware, and if these pots are subsequently used for pink varieties, or seedlings, it is very probable that there will be just enough material released from the pot to spoil the pink colouring.

Notwithstanding the many fine varieties of Hydrangeas now in commerce, there are great possibilities in the development of new colours and shades that may prove valuable additions to a popular race of garden plants. *Geo. W. Stacey, Chorley Wood Cedars.*

## ORCHID NOTES AND GLEANINGS.

### MICROSTYLIS SCOTTII.

THIS terrestrial Orchid combines beauty of flower with beauty of foliage to an extent unattainable and seldom found among plants of the order Orchidaceae, and it compares favourably with many species grown solely

FIG. 173.—ONE-YEAR-OLD SEEDLING HYDRANGEA IN AN EIGHT-INCH POT.

good strain of the old *H. Hortensia* are obtainable, it is advisable to utilise them, as they impart robustness to the seedlings. When the old head of fertilised flowers is ready it should be cut and dried, and a few weeks later the tiny seed-pods may be removed and packeted.

The seeds are very small; I should think among the very smallest. The simplest method of sowing them is to break the pods over the surface of sandy soil that has been well watered, and cover them with a sheet of glass. Seeds were sown thus in February and the seedlings appeared in about a fortnight. The subsequent treatment accorded was similar to that adopted for seedling Begonias. During the summer the plants were stood in a cold frame, on ashes, with the lights removed on warm nights.

It is too early yet to determine whether the seedlings are evergreen or become defoliated during the winter. Our plants were kept cool last winter and remained evergreen. When about six months old a number of shoots spring from the base of each plant, and if single, specimen heads of bloom are desired these must, of course, be removed; some of the Chorley Wood seedlings carried a central flower-head and up to half-a-dozen partly-opened heads at the same time. Out of a first batch of fifty plants there were hardly two alike in foliage and habit; they ranged from dwarfs, in forty-eight-sized pots, to giants in eight-inch pots (Figs. 174 and 173).

Hydrangeas grown in pots are not blue natur-

ally, but some varieties show a trace of mauve and in this connection a curious point has arisen. It is figured in *Bot. Mag.*, t. 7,268.

Being a native of Penang and the Malay Peninsula, it requires a stove temperature all the year round, with a resting period, during which water should be withheld. The flowers are borne on an erect spike, springing from the centre of the young growth. The ovary is not twisted, and the labellum is the most conspicuous part of the flower, contrasting, with its deep, creamy colour, against the deep, brownish hue of the petals, sepals and rachis.

The leaves are particularly pleasing, being of a deep, purplish-brown around the midrib, and lighter in colour, but prettily marked around the margins.

Towards the end of summer, when the young growth has formed a pseudo-bulb, the plant may be gradually dried off so soon as the leaves fade and fall. In early spring the pseudo-bulbs should be shaken out of their compost and placed separately in receptacles containing pure silver sand. So soon as roots and shoots appear the pseudo-bulbs should be potted singly in large sixty-sized pots in a compost consisting of equal parts of loam and peat, Sphagnum-moss and sand, and crocks. *Microstylis Scottii* will eventually repay all care that is taken in its cultivation.

*M. congesta*, a green-flowered species, of much coarser growth; *M. Wallichii*, and *M. Mackinonii*, will respond to the same cultural methods. *J. Robbie, Kew.*

## The Week's Work

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Odontoglossum.**—Plants of the grande and Inseayi section, which include the largest flowered of all known Odontoglossums, require a slightly higher temperature than, and somewhat different treatment, to the alpine species of New Granada. Where *O. grande* and its congeners, *O. Inseayi* and *O. Schlieperianum*, are found growing in their native countries, the average mean temperature is high, and there is a dry season of four to five months duration. During the winter these Orchids are best grown at the cooler end of a house in which an intermediate temperature is maintained, where they can have a period of rest, but during the summer the warmer end of the Odontoglossum house is more suited to them. *O. grande*, with others of these Mexican Odontoglossums, will have commenced to grow, and when roots develop from the bases of the new growths, any necessary repotting should be done. *O. Williamsianum*, which is a hybrid of *O. grande*, is at the present time throwing up its flower-spikes, and the repotting of this variety should be deferred to a later period. *O. grande* usually produces its flowers during the winter, whilst *O. Inseayi* and its varieties bloom in August and September. These Orchids make thick, fleshy roots and resent a sour compost, therefore, it is advisable to repot them when the compost has the slightest appearance of being decomposed. The compost usually employed for Odontoglossums is suitable for these plants, but it should be thoroughly cleared of dusty particles and used in as rough a state as possible.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Runner Beans.**—Well-hardened plants of Runner Beans growing in pots or boxes may now be planted into the positions which have previously been well prepared for them, but before doing this, water the soil in the receptacles containing the Beans. Lift the plants with a good ball of soil at the roots, and disturb the latter as little as possible. The plants should be set alternately in double rows, allowing a distance of not less than twelve inches each way. The stakes on which the Beans are to be trained should be placed in position before planting; should the weather prove frosty, they will offer a ready means of carrying the necessary coverings. In hot, dry weather the plants should be kept well watered. It will be wise to place a small band of soot around the base of each plant. Keep a sharp watch for black fly, and spray the foliage at once with Quassia extract so soon as the pest is detected.

**Waxpod or Butter Beans.**—The Waxpod Bean is generally regarded as a greater delicacy than the ordinary dwarf and runner varieties. Seeds may either be sown out-of-doors in May or seedlings raised indoors and planted out now, on a warm, well-prepared border, sheltered from cold winds.

**Marrows.**—Strong, well-hardened Marrow plants may be set in the open, provided temporary protection can be given them when necessary; evergreen branches stuck around the plants are very useful in warding off cold winds.

**Tomatos.**—Strong Tomato plants may be planted against warm walls or fences facing south, but it will be wise to have protective materials ready at hand in case of frosts. The soil for Tomatos should not be of a rich nature, which favours strong, sappy growth. Good loam, mixed with burnt refuse, old mortar rubble or lime and a small quantity of bone-meal is

suitable. Make the ground very firm before planting. Pinch out all the side-growths while they are very small, and train the plants to a single main stem. After about five good trusses of fruits have set, the point of the leading stem may also be pinched out. Do not attempt to feed the plants until the fruits are swelling.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Chrysanthemums.**—Plants of Chrysanthemums that are being cultivated to produce large blooms should now be placed in the pots in which they will flower, but this should not be done before they have been hardened sufficiently to withstand cold winds, otherwise some of the lower foliage may drop. The receptacles may be from eight inches to ten inches in diameter; the larger size is suitable for strong-growing varieties. The pots should be clean and well-drained. Cover the crocks with turf, from which most of the fine soil has been shaken, for efficient drainage is essential for Chrysanthemums. The compost should consist chiefly of good loam, adding leaf-mould, manure from an old Mushroom-bed,

FIG. 174.—ONE-YEAR-OLD SEEDLING  
HYDRANGEA IN A 48-SIZED PO

(see p. 367).

and, to each barrow-load of soil, one four-inch potful of bone-meal, the same amount of soot, and a little Chrysanthemum fertiliser. The compost should be prepared and the ingredients thoroughly incorporated several days before it is used. Firm potting is necessary to ensure good, short-jointed growths, which are essential to produce large flowers. The shoots should be staked and the stakes made secure to wire, arranged for the purpose. Careful watering is necessary at this stage; do not supply moisture in excess, and never allow the plants to suffer from drought. In hot, dry weather occasional sprayings during the day will prove beneficial to the plants. Green and black fly are sometimes troublesome, but these pests are easily destroyed by spraying with nicotine soap; see that the specific reaches the crown of the plant, for it is here that the fly attacks and harms the young leaves.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Successional Melons.**—As the days increase in length and the sun gains power, fire-heat may be greatly reduced in the house in which successional Melons are growing, provided the beds are carefully renovated. The plants are very subject to attacks of spider, therefore every part

of the house should be well cleansed after the plants are removed and fresh fermenting materials should be used for the next batch.

**Forced Cherries.**—Houses in which the earliest varieties of Cherries are ripening should be kept somewhat drier on dull and wet days than heretofore, and as freely ventilated as may be consistent with the swelling of the later sorts grown in the same house. If trees in borders are well watered and mulched shortly before the fruits change colour, they will hardly require more root moisture until after the crop is gathered. Do not syringe at this stage, but if aphids is troublesome, fumigate the house on a fine, calm evening, when the foliage is quite dry, just before the earliest fruits show signs of changing colour.

**Early Vines.**—Vineries in which the Grapes are approaching maturity should be ventilated freely and less fire-heat used, while the amount of atmospheric moisture should be reduced. The roots of the vines should not be allowed to become dry, or even partially dry, as drought is one of the most common causes of the berries cracking. If cracking is troublesome with such varieties as Foster's Seedling and Madresfield Court, water the border once liberally after the berries have commenced to change colour, cover up the borders to prevent the escape of moisture, and keep the houses extra dry when the weather is very unsettled. If the laterals have been allowed to develop freely, the stronger ones may be shortened by degrees and the weaker left intact to cause the sap to flow freely. Keep a sharp watch for red spider; syringing being out of the question with ripening Grapes, the best preventive is sulphur. So soon as the Grapes are ripe, the house should be kept as cool and airy as possible, and unless the foliage is very dense, black varieties, which soon lose their colour, should be lightly shaded with fish netting. White varieties, on the contrary, are, when the berries are fully developed and fairly coloured, greatly improved by exposure to light, always provided a free circulation of air is maintained to prevent an excess of atmospheric moisture. So soon as the house is cleared of the crop, say, at the end of June, the vines will require careful management for the remainder of the summer, especially if the weather is hot and dry and there is the slightest trouble with insect pests, when the syringe or hose must be requisitioned. Laterals are a great help in giving strength to the main buds, but they should not be allowed to shade the main leaves.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Strawberries.**—Although many of the buds and open flowers were destroyed by the late frosts, a fair crop of Strawberries is expected in these gardens. The plants are looking extremely well in some cases, but the soil requires a good soaking of water to help the berries to swell. The beds should now be covered with clean straw, if obtainable, to prevent the berries from becoming soiled. First clear the ground of weeds so that no more attention in this respect will be needed until after the fruits have been gathered. The berries of early-fruited varieties planted on a warm border should be protected from birds; drive light posts, four or five feet high, into the ground at reasonable distances apart, on the outside of the bed and at intervals in the beds. Fasten wire on the tops of the posts to carry fish netting and make the ends and sides of the netting proof against the birds.

**Pears.**—The fruits on wall trees have set very freely and some amount of thinning will require early attention. Before doing this important work consideration should be given to the size of the variety and the strength of the trees. Large varieties cannot be expected to develop good, well-flavoured fruits if too heavily cropped, and the same is true of trees that are not too strong in growth. Young trees especially should not be overcropped as this

would exhaust their energies and result in feeble growth afterwards for some years. Small and imperfect fruits should first be removed, and later the number should be reduced to a suitable crop.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Spring-flowering Plants.**—As these plants are removed from the beds and borders they should be divided and replanted in the reserve garden. Keep the plants in the shade until they are wanted for planting, and make them firm in the soil. They should then be well watered, leaving a depression along the lines for this purpose. When the water has drained away, draw the dry, loose soil up to the plants; this is a very efficient method of watering newly-set plants, and one application of water usually suffices, unless the weather is exceptionally dry. The plants to be dealt with in this way include Aubrietias, *Iberis sempervirens*, *Phlox subulata* in variety, double Daisies, such as Rob Roy, Alice and Dresden China (the very large-flowered, double Daisies are easily and best raised from seeds, which should be sown about the middle of June); *Doronicums* and *Veronica gentianoides*, together with its variety *pallida*. *Violas* that have been used for a spring display may be shortened back, divided and planted out in the nursery. *Arabis albidula* fl. pl., the double-flowered *Arabis*, is best propagated from cuttings inserted now, for if propagated too early the plants usually become over-grown before the autumn.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Calceolarias.**—Plants raised from seeds sown about this time last year are making a fine display, and in order to secure fresh stock, seeds should be sown at once in moderately cool conditions, as *Calceolarias* are comparatively hardy and resent much fire-heat. The many fine varieties now in cultivation offer the grower a wide choice to select from, and when well-grown, a batch of plants with their varied coloured and very large flowers command attention and admiration from most people. The seedlings should be pricked off into thumb pots so soon as they are ready to handle, and grown on, repotting them when necessary. They should be wintered in four-inch or five inch pots. When signs of new growth appear in March, they should be again shifted into larger pots, using a fairly rich compost, consisting of loam, leaf-soil, decayed manure and sand. When the pots are well-filled with roots the latter should be regularly supplied with diluted liquid manure. Care should be taken at all times to keep the plants free from green fly.

**Spring Bedding.**—Where the spring-bedding plants are over, the beds should be cleared, and, if the soil is exhausted, enriched with well-decayed manure, especially if it is intended to grow such plants as *Begonias* and *Dahlias*. Where *Pelargoniums* are still grown, additional manuring at this time is unnecessary, as these plants flower freely in poor soil. The carpeting plants, such as *Arabis* and *Aubrietia*, should be divided and replanted at once in the reserve garden, where they should be well-looked after in order to have useful plants again in the autumn. Daisies may also be put out in nursery rows, and if a quantity of old potting soil is placed at their roots, and the soil afterwards well-watered, the plants will soon become re-established. Wallflowers are usually of no further use, and may be cleared off. A plant of the old blood-red variety attracted much attention in a cottage garden recently; it was several years old, between four and five feet high, and made a wonderful show; when first viewed from a distance it was impossible to say definitely what it really was, as it looked like some glorious flowering shrub, instead of the lowly border Wallflower.

### ALPINE GARDEN.

#### MESEMBRYANTHEMUM UNCINATUM.

I HAVE tried to grow several of the Noon Flowers which appeared to hold out some promise of sufficient hardiness to withstand an average winter, but found only one which may be said to be hardy. This is *M. uncinatum*, not to be confused with *M. uncatum*, which has also been tried and proved too tender for my district.

The success with *M. uncinatum* was a greatly modified one, as it was found that though on a sunny, sheltered part of the rock garden, it never bloomed, although it made a good-sized specimen. It is a plant of unique appearance among its companions, with its thick, succulent, sharp leaves, which remained all the winter. It was not to be despised, although its failure to bloom was a great disappointment.

Were I to try it again it would be on a sunny, sheltered wall. S. Arnot.

the inflorescences, when in an undeveloped state, bear a marked resemblance to those of some of the *Muscari*. The flowers are violet-blue, almost a good pure blue. The plant may be colonised on the margins of streams or ponds or in the rock garden, if provided with a deep and moist root-run. The flowers appear in April; the leaves are coated with soft hairs, a warning to growers that excessive winter damp is inimical to the plant, although I have not noticed any great mortality from damping.

As in all the *Muscaroid* *Primulas*, the flowers of *P. Giraldiana* are aggregated in a close spike, the mouths of the corollas hanging downwards. The flowers begin to open at the bottom of the spike and proceed regularly to expand upwards. The opened flowers, surmounted by the purplish cone of buds, give the plant a most distinctive and *Muscari*-like appearance.

The flowers are faintly, but pleasantly fragrant. Ralph E. Arnold.

FIG. 175.—MECONOPSIS PSEUDOINTEGRIFOLIA AT GLASNEVIN.

(see p. 371).

#### CHEIRANTHUS HARPUR CREWE.

Those who do not consider double flowers out of place on the rock garden will find *Cheiranthus Harpur Crewe* an excellent plant for the rockery.

It forms a neat bush, eighteen inches to two feet high, and about as much round, bearing in March and April, numerous short spikes of bright, double yellow flowers, which, from a distance, suggest a golden crown.

The flowers are sweetly scented and last a considerable time. The variety is perfectly hardy and perennial, and is effective either as a specimen plant or in drifts on a sunny slope of light soil. It will also succeed on the upper courses or top of a dry wall. L. Le C. T.

#### PRIMULA GIRALDIANA.

This delightful little *Primula* was, I believe, discovered by Forrest, in Yunnan, in 1908, and was for a time known as *P. muscarioides*;

### HARDY FLOWER BORDER.

#### CHRYSANTHEMUM ULIGINOSUM.

As a subject for the herbaceous border, *Chrysanthemum uliginosum* (syn. *Pyrethrum uliginosum*) is much appreciated. It makes a splendid show during September and October and the elegant heads of pure white flowers are delightful for arranging in vases and eminently suitable for church decoration, harvest festivals, etc.

The plant is not particular as to soil or situation, but it does best in a good, medium loam which has been dug deeply and manured liberally. March is a suitable time for planting; the old clumps should be lifted and carefully pulled apart, rejecting the weak, central growths, and selecting the stronger ones from the outside for planting at a distance of nine inches apart to form a large clump. During its first season *Chrysanthemum uliginosum* will attain a height of from four-and-a-half feet to five feet. T. H. Everett.

## SEASONAL PESTS AND THEIR CONTROL.

### LEAF-EATING INSECTS.

"DAMAGE by Caterpillars" is a phrase well-known in all parts of the country. There are many caterpillars which attack fruit trees generally, whilst there are others which attack particular crops only.

The caterpillars responsible for most of the damage are those of the Winter Moth, Mottled Umber, March Moth, Codlin Moth, Small Ermine and Magpie Moth, and the grubs of the various Sawfly.

The general method of attack consists in coating the foliage and young fruitlets with a stomach poison, such as arsenate of lead, Hellebore powder or Derris. The main object aimed at is (1) to secure an even coating of the poison, and (2) to have it in position either before or just as the caterpillars are hatching out, because in the earlier stages they are much easier to kill.

Two kinds of arsenate of lead are offered, namely, arsenate of lead paste and arsenate of lead powder. The former has enjoyed a very extended use for a number of years, and on analysis should contain not more than fifty per cent. moisture, not less than fifteen per cent. arsenic pentoxide, and not more than a half per cent. soluble arsenic tri-oxide; the latter, as the name implies, is a dry powder arsenate of lead, which should contain not more than two per cent. moisture and not less than thirty per cent. arsenic pentoxide, and not more than a half per cent. soluble arsenic tri-oxide.

Arsenate of lead paste is used at the rate of three to four pounds per 100 gallons of water. The powder is generally used at half this strength. When applying arsenate of lead it is necessary to use a very fine mist sprayer, and where hard water is encountered, a suitable spreader is very desirable if an even film of arsenic poison is to be obtained.

There are various spreaders which may be used, namely, calcium caseinate, dried milk, saponin and powdered glue. It has been shown that powdered glue dissolved in water at the rate of 1½ lb. to forty gallons of water, possesses a property of holding arsenate of lead in suspension, and at the same time increasing the spreading properties.

The caseinate, dried milk and saponin, whilst possessing superior spreading properties to the glue, are not so good when considered from the point of view of aiding suspension.

Calcium caseinate should not be used where the water is known to contain much bi-carbonate of lime hardness, owing to the fact that the lime in the calcium caseinate re-acts with the bi-carbonate forming chalk, which is thrown out as a precipitate and leaves the casein as a gelatinous sludge on the surface of the spray fluid, thereby causing considerable annoyance from nozzle-clogging, etc.

When spraying with arsenate of lead, the usual practice is to carry out the operation immediately before the blossoms open, and again after they have set. It is never wise to use arsenate of lead during the actual flowering period, although under commercial conditions this is very often done. It has been shown that much damage has been done to bees, which are responsible for cross-fertilisation, from the use of arsenate during the flowering period.

In the case of Gooseberries and Currants, arsenate of lead, unless used in the very early stages, is not considered suitable owing to the risk of contamination of the fruit. In cases where it is desired to spray after the fruit has set, a paraffin emulsion might be used or Hellebore powder at the rate of four ounces up to 1 lb. in ten gallons of water, containing a suitable spreader or sufficient soft soap to encourage spreading.

### CAPSID BUG.

Capsid Bug is causing considerable trouble in various parts of the country, particularly in Wisbech and certain parts of Kent. It is a

sucking insect which feeds upon the sap of the plants. The first signs of the attack are generally the appearance, in the early part of the season, of small, brown spots on the young leaves, which are caused by the punctures of the insect. As these leaves grow older the surrounding parts of the puncture either die or fall out or fail to develop, with the result that they become very deformed, ragged and under-sized.

The bugs also attack the shoots, which are often checked or even killed, and thus encourage the formation of excessive numbers of side growths. The fruits are also attacked, and in a case of a bad infestation, they are unmarketable.

There appears to be some variation in the extent of injury to different varieties of Apples, Bramley's Seedling sometimes suffering less than others. Black and Red Currants are also attacked.

The Capsid Bug is a very difficult pest to control, requiring very careful, thorough and systematic spraying. The main thing is to hit the bug, which is a somewhat difficult matter.

A fairly coarse nozzle with very high nozzle pressure should be used, the best results being obtained at a pressure of 170 lbs. to 200 lbs. to the square inch. The best time to spray varies considerably with the season, but it is generally during the week or ten days immediately preceding the bursting of the blossom. A careful watch should be maintained for the first signs of the spotting on the leaves.

Undoubtedly the best insecticide to use is a mixture of nicotine, 10 to 12 ounces, soap, 10 to 15 lbs., water 100 gallons. At the same time, this wash will be found very effective for killing aphides, sucker, etc.

### WHITE FLY UNDER GLASS.

This pest has appeared already in various parts of the country and appears likely to cause its usual amount of annoyance. White Fly must be controlled early, because, if the infestation becomes firmly established, it is difficult to deal with. For this reason fumigations at low concentrations and at frequent intervals are preferable to single fumigations at heavy concentrations applied occasionally.

White Fly may be successfully controlled by the use of tetrachlorethane, at about two-and-a-half ounces per 1,000 cubic feet concentration, but this must not be used for Cinerarias and Chrysanthemums.

Cyaniding is undoubtedly the most effective method, and of the two forms, calcium cyanide is to be preferred to sodium cyanide, as it is much more simple in application, and the gas is given off much more slowly than in the case of the sodium cyanide. Incidentally, no acid or pots are required in its application.

In America and in certain of the market-growing districts in this country, calcium cyanide is used as a routine practice, at low concentrations, applied at intervals of, say, a week.

The main conditions to be observed in its application are: a dry house, a dry atmosphere, an even temperature and a low dosage. Theodore Parker.

## NOTES FROM WISLEY.

ALMOST every year late frosts take toll at Wisley, and the records show that 15° or more are often registered during the last week in April. Not for many years, however, has so much damage been done as of late. The whole of the Azalea bloom and that of most fruit crops has been ruined, while both flowers and foliage of many plants which usually weather the worst frosts have been completely seared. This is all the more surprising in view of the fact that the ground was quite dry, and that the amount of frost registered was not unusual for the month. A possible explanation is to be found in the high temperature registered during the day time and during the nights previous

to two successive nights of sharp frost, and which may have brought things along too quickly.

Unfortunately, the frost has had little effect on insect pests. Green fly is abundant, and the frost-bitten buds of the Apple trees provide ideal conditions for the spread of the Apple-blossom weevil. Insects are also causing great damage to vegetable and other seedlings, the growth of which has been almost at a standstill on account of the drought.

There is now a good show of bearded Irises, although the frost damaged the flowers and even the flower stems of some plants. There are now so many as 987 varieties in the trial, but quite a number are very similar and one or two varieties bearing different names are for all practical purposes indistinguishable from each other. In flower against the Garden-Keeper's house are some pretty hybrid Irises belonging to the Regelia section, which were raised by the late Mr. W. R. Dykes. The flowers are delicately veined and of various shades of light purple and brown. The best known kinds of this interesting section are *I. stolonifera* and *I. Hoogiana*. They require a warm situation, and to be flowered successfully must be dug up about the second week in July and dried off until October.

Against the warm wall of the laboratory many good shrubs and climbing plants are in flower, the most conspicuous being *Ceanothus dentatus* and *Solanum crispum*. A less familiar plant is *Olearia myrsinoides*, with white flowers and handsome foliage, the under-surface of which is covered with a white tomentum. This is also a specimen of *Teucrium fruticosum*, with large, Rosemary-like blossoms. *Decaisnea Fargessii*, a native of China, is also in bloom, the flowers taking the form of greenish bells. It is a dioecious plant and the female bears fruits which are edible and resemble big blue caterpillars. Another Chinese shrub in flower is *Loropetalum chinense*, which is nearly related to the genus *Hamamelis*. The foliage is evergreen, and the creamy-white flowers similar to those of the Witch Hazel. The fan-like branches of *Cotoneaster horizontalis* planted against this wall are crowded with blossoms in which bees delight. Large numbers of the fallen petals have been trapped in a spider's web beneath the plant, and a curiously attractive effect is presented.

On the rock garden many species of *Veronica* are in bloom. One of the most useful is *V. filiformis*, which makes a good carpet without becoming too rampant. Among the taller sorts *V. gentianoides* is conspicuous, while *V. circaeoides*, with lavender flowers, and *V. pectinata* with pink flowers and woolly foliage, are also noteworthy. *Asperula suberosa* growing out of the rock face is one of the finest individual specimen plants. It has grown even better than specimens in the alpine house, and the masses of pale pink, tubular blossoms cover a considerable area. Healthy growth is also seen in a bed of *Gentiana verna*, now in bloom. The plants were raised from seeds collected in Scotland and sown only two years ago. Had it not been for the ravages of cockchafer grubs there would have been an even better display. *Iberis gibraltarica* has not been damaged by frosts and is blooming well in company with *I. Garrethiana*. The latter is one of the very best and largest white-flowered perennial Candytufts. A peculiar feature of *Erodium gruinum*—with blue flowers now opening—is the beaked fruit which assumes the shape of a corkscrew and bores into the ground. Another pretty Heron's Bill in bloom is *Erodium chamaedryoides*, with pink flowers. Bright pink flowers are also a feature of a British Columbian variety of *Phlox Douglasii*, the type plant of which has lavender blossoms.

The alpine house has still many objects of interest, particularly Saxifrages belonging to the *Euaizon* group, such as *S. cochlearis*, *S. norvegica* and *S. Hostii*, with flowers spotted red. Here also is flowering a biennial *Saxifraga*, *S. latepetiolata*. Other plants in flower in this house include *Linnaea borealis*, *Lloydia graeca*, *Brodiaea Douglasii*, *Lewisia Cotyledon* and *Lewisia columbiana* which is considerably dwarfier than the preceding species. J. E. Grant White.

## NOTES FROM GLASNEVIN.

THE abnormally cold weather experienced during early April has persisted into the middle of May. Severe frost occurred on the night of Saturday, April 30. Soft, young growths on trees, shrubs and herbaceous plants were

much beauty in its starry, bright blue flowers on long stems, produced from a compact rosette of glabrous leaves. It has been suggested as an extreme form of *Anemone obtusiloba*, of which the variety *patula* is also in flower, but it seems far enough removed to merit specific rank; both plants are natives of the Himalayas.

FIG. 176.—ROTTLERA FORRESTII.

badly cut, and the Chinese Rhododendrons suffered severely. The damage done was not quite so bad as on May 10, 1926, as growth was not so far advanced, nevertheless, it is evident that many of the newer species of Rhododendron will have a hard struggle to get accustomed to our fickle climate. There is one hope, however, for it was noticeable that where one or two branches on a bush had formed flower buds the growth buds below were still dormant, whereas shoots without flower buds had made growths several inches long, and these were cut back. Possibly, therefore, when flowering becomes more general growth will be later.

The rock garden is now a centre of attraction. The most important point of all is proper arrangement and is gay with many bright groups of the more showy plants, such as *Aubrietia*, *Alyssum*, *Iberis*, *Aethionema*, *Alpine Wallflowers*, *Androsace*, etc.

*Meconopsis pseudointegrifolia* (Fig. 175) has flowered particularly well this year in the small bogs so useful in association with the rock garden. The main flower stem arises from the rosette of leaves, and just above them branches into several stems, each bearing a large, clear-yellow flower. The blue-flowered species are following fast, the spikes being already forward on *M. aculeata*, *M. sinuata*, *M. rigidiuscula*, and showing on *M. racemosa* and *M. Prattii*.

*Rottlera Forrestii* (Fig. 176), a delightful plant of the same family and habit as the *Ramondia*, is now in full flower. The flowers, borne three or four together on slender stems, are rich yellow, tubular, but smaller than those of *Ramondia*. Several plants have survived two winters in the open and look healthy planted vertically in a position facing north-east.

Another member of the Gesneraceae collected by Forrest, probably a *Briggsia*, planted in the same position, does not look so happy, but is alive. Repeated attempts to succeed with *Briggsia amabilis* in the open have failed, so that as far as Glasnevin is concerned, the genus does not hold out much promise for the rock garden.

*Anemone potentilloides* (Fig. 177) is a charming little species for those who like uncommon plants. Although lacking the vigour and brilliance of some of its congeners, it has

A common plant, but one which never fails to charm, is the "Snowdrop Anemone," *A. sylvestris*. When planted in a large mass the flowers are so numerous as to hide the leaves and when gently swaying, as they constantly

having arching racemes after the manner of *S. cochlearis*, but with different leaves.

Daphnes are interesting shrubs for the rock garden, and of these *D. Cneorum* is probably the most popular, forming at present a glorious mass of pure pink. Others now in bloom are *D. arbuscula* and *D. Fioniana* (neapolitana), both with purple flowers which become paler as they expand, and the robust but free-flowering *D. caucasica*, a mass of white, sweetly-scented flowers.

Of Rhododendrons, I write with diffidence, but the best of those in flower at present are *R. ledoides*, and *R. sphaeranthum* with Daphne-like clusters of small pink blossoms; *R. obtusum japonicum* (Kurume Azaleas) in shades of pink, some more attractive than others; *R. Poukhanense*, with lilac flowers and, among the large-leaved species, *R. decorum*.

Shrubs generally suffered from frost during the early part of the month, but a few escaped serious injury, notably the Broomas. All the better-known species and hybrids are flowering freely, and considerable interest is being taken in a small bed near the Leguminosae collection which contains some of the hybrids, including *Dallimorei*, still one of the best; *Dorothy Walpole*, unique in colour; *Donard Seedling*, and a collection of seedlings presented by Messrs. W. Watson and Sons, of Killiney, some of which are of considerable promise.

*Spiraea conferta*, a hybrid between *S. cana* and *S. crenata*, is flowering in succession to the popular *S. arguta*. The hybrid is of similar proportions, but the branches are less stiff, and curve gracefully when furnished with numerous corymbs of white flowers; it is a plant which may be recommended to those who are interested in hardy flowering shrubs.

The most interesting plant in the bog garden at present is *Lysichitum camtschaticense album*, which flowers considerably later than the yellow-spathed type. As it gains in age and strength this promises to rival the better-known species as the most striking of hardy Aroids. The yellow type received the R.H.S. Award of Merit on April 26 when shown by Messrs. M. Prichard and Sons.

FIG. 177.—ANEMONE POTENTILLOIDES.

are, there is no more beautiful group in the garden.

Saxifragas of the so-called encrusted section are now conspicuous, among them the many forms of *S. aizoon*, including *lutea*, *rosea* and *atrosanguinea*. *S. cochlearis* is always admired for its graceful, arching sprays of white flowers; *S. lingulata*, also a plant of many forms, produces some wonderful effects, the best forms

Although less conspicuous than the May-flowering and Darwin Tulips, the species continue to give a good account of themselves. Notable at present is the dark, coppery-red *Tulipa Hageri*, and the taller, lighter-coloured variety, *nitens*; *T. Didieri Mauriana*, a brilliant bright scarlet, and the shy-flowering, pink *T. saxatilis*, which flowers best in dry, stony soil. J. W. Besant.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.**

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## PROBLEMS OF BOLTING.

THE appearance of bolting, simple enough to the eye, is the result of the action and interaction of such a multitude of varying conditions, particular and general, that we can only hope to bring order out of confusion by examining the question to some extent analytically.

We might, for convenience, consider bolting—arbitrarily, for the distinction cannot be maintained in practice—to be of two kinds: (1) premature flowering of a crop as a whole; (2) premature flowering of a portion of a crop. In the first case, the special problem would be a physiological one, concerned with the exceptional behaviour when exposed to exceptional conditions of genetically similar individuals, and the remedy lies in altering or controlling, where possible, these conditions. In the second case the special problem is a genetical one, concerned with the exceptional behaviour when exposed to normal conditions of genetically exceptional individuals; and the remedy lies in removing a defect, one that is inherent in most commercial seeds—i.e., lack of genetical uniformity. In every case, however, it must be borne in mind that the capacity to flower at a given moment is due to the condition of the plant at that moment, and that this condition is the result of the particular genetic constitution of the plant and the particular external conditions under which it has been grown. Variation in this capacity can, therefore, always be studied from both a physiological and a genetical standpoint. Genetics and physiology approach the same problem from different aspects.

Whatever stimulates flowering must have a very different character in different species, on account of the different relationships between vegetative and reproductive life. For example, in some crops, such as Cabbages, Mangolds and Cereals, the vegetative life of the plant is almost complete before flowering begins; the whole of the accumulated reserve materials of the plant being employed in the simultaneous production of a large number of flowers. In others, such as Peas and Beans, the reproductive processes, which begin early, are carried on side by side with the vegetative processes with increasing vigour throughout life. Clearly, the accumulation of reserve products has not the same significance in relation to flowering in the two types.

Again, in different species the reserve materials are stored in different forms, and these conceivably modify the effects of special conditions, such as drought, in the stimulation of flowering.

Let us now consider two types of bolting in detail. If Lettuces are sown in spring they flower, after passing through a special vegetative phase, at a stage of structural development which varies with each race. It is sometimes said that subjection to shocks, such as transplanting in dry weather, will induce bolting, but although I have tested this suggestion by transplanting numbers of Lettuces of several varieties at different dates in May and June, in dry weather, no effect was ever produced save to retard maturity and flowering relatively to the controls. Indeed, by keeping Lettuces in dry conditions throughout the summer it was possible to postpone maturity almost indefinitely. Other checks, such as sudden changes of temperature, produced no effect on flowering. Yet it is certain that in other plants such effects can be produced.

There is clear genetical variation between different races of Lettuces in the time they will stand, mature, before bolting, although this time of course, is always subject to variation in conditions. The immediate stimulus to flowering is probably always a change in external conditions, for the uniformity with which a row of Lettuces will begin to bolt overnight can hardly be accounted for by the internal development of each individual having reached exactly the same stage at the same moment.

Bolting in crops grown as biennials is complicated by the fact that a period of suspension is introduced into the vegetative life of a plant during which flowering is rendered impossible by external conditions, the two most important factors in determining this phase being temperature and the daily duration and intensity of light. While in some species these are both negligible, in others they control the moment of flowering with precision. Many short-lived plants—Cotton and Ten-week Stock, for example—flower at a definite period after sowing; similarly, Beans, provided the temperature is kept above the critical level, will flower in as great profusion and with as great fertility in December as in June. Other crops, such as cereals, owing to the critical periodicity of light and dark necessary to permit flower-formation only occurring in this country about midsummer, are restricted, unless artificial lighting conditions are employed, to a definite period of the year, whatever time the seed is sown. In Tobacco this reaction is made use of commercially to control flowering. Normally, the root crops are sown just so late in the opinion of the farmer as to prevent their arriving at maturity and bolting before this dead period sets in, when light and temperature fall below their critical values. When the growing season is prolonged by fine autumn weather, bolting occurs for the same reason as autumn flowering in normally spring-flowering perennials. If the crop is sown too early a proportion bolts, while the later sowing reduces the yield because the growth of the crop is stopped prematurely. Further, if the season is favourable to rapid growth, the critical development is more likely to be reached before the fall of light and temperature below their critical values, and bolting will thus be similarly encouraged.

Beyond these three variables in conditions—time of sowing, favourableness of the season for growth, earliness of the fall of temperature in autumn, there is the fourth variable or group of variables—genetical constitution. The exceptional bolting of small individuals in a root crop is the specific result of the genetic property of these individuals, which causes them to flower early, and therefore only occurs in a crop raised from genetically mixed seed. The condition of this bolting is an abnormal season, but purity of strain provides a complete practical remedy.

I may state that there are two directions in which the bolting propensities of a strain may show that genetical variation which enables the plant-breeder to select an improved form. In the first place a difference in rate of growth, in size or food reserves, other things being equal, may constitute the difference between a bolter and a non-bolter; but it will be seen that if the breeder selects for non-bolting in a reduced rate of growth he is selecting also for a reduced yield or inferior quality.

In the second place there is an elusive property,

or rather assemblage of properties, to which I can give no better name than responsiveness to the stimulus to flower. This consists in the amount of reserve material, or degree of development, necessary to permit flowering under given external conditions, and is of paramount economic importance. Only chemical analysis and measurement can determine to what extent each of these two possible variations is being selected for in choosing non-bolting plants to breed from.

The late Mr. Bateson found that many well-known varieties of Mangolds were exceedingly variable in respect of bolting. He selected from Golden Tankard and other varieties generally producing a proportion of bolters, certain individuals which did not bolt, although sown in heat in January, and almost immediately obtained strains which bred true to non-bolting even under the exceptional conditions of 1921, when not one of 1,700 plants from a sowing of April 12 showed any sign of bolting. That rate of maturing was, however, involved—that the difference was here, as always, a relative and not an absolute one—was shown by the bolting of one per cent. in one strain, and eight per cent. in another of plants raised from a December sowing of the previous year. It is not known whether such a high degree of freedom from bolting—perhaps an economically unnecessary degree—is compatible with the highest yielding capacity. In selecting these strains no attention was paid to this important practical question, and in consequence the quality of the roots may have slightly deteriorated. This need not, however, discourage the breeder from further efforts, which can hardly fail to yield economic advantages, for there is no reason to doubt that present yields can be maintained with complete freedom from bolting.

It is, perhaps, not too much to state that both genetical and physiologically bolting may be regarded as a normal, although very intricate, process. The physiological problem is not understood in detail, but far from standing alone it is in accordance with a considerable range of analogous phenomena. Making allowance for the complexity of the physiological processes, the genetics of bolting is equally in accordance with current views of analogous problems. There can, therefore, be no excuse for consigning bolting to a category of mysteries.

The remedy for bolting is clearly indicated: uniform cultural methods applied to crops raised from genetically uniform seed, rigorously selected for resistance to bolting, will, to a great extent, mitigate the effects of a capricious climate. C. D. Darlington, John Innes Horticultural Institution.

## OLD-FASHIONED FRAGRANT FLOWERS.

THE complaint is often made that modern varieties of such flowers as Roses, Pinks and Carnations are lacking in scent, and whilst breeders have given us rich colours and fine form, they have neglected fragrance entirely. In the meantime, why not hark back to the days of our grandparents and grow those old-fashioned flowers, many of them now but a fast-fading memory? Those who traverse the byways of Britain will even now occasionally find a cottage garden glorified by the colours and perfumed with the fragrance of old-world garden Pinks, the real old Clove Carnation, Sweet Rocket (Hesperis matronalis), and Brompton and East Lothian Stocks. Auriculas of the "Dusty Miller" type ("Bagers," a corruption of Bear's Ears, in West Country vernacular) and double Primroses, brighten the garden in spring, and these are soon followed by single and double Wallflowers, these in their turn being succeeded by the Madonna Lily and old-time Roses, with masses of Lavender, Rosemary and of Artemisia—"Old Man."

It is an exquisite pleasure to imagine such a garden, and realisation may be secured at very small cost; the greater difficulty may be the procuring of some of these old favourites, as, for instance, some of the double Primroses. These exquisite flowers possess a faint but delicious perfume, reminiscent of woodland and

**Do you wash  
your face?**

Of course you do, if you desire to be healthy. Then **WHY** expect to keep your Fruit, Flowers and Vegetables free from disease without making efforts to cleanse them?

In their case the need is the more urgent because of the multitude of voracious insects that infest them,

and of the amazing rapidity with which they multiply, if unchecked.

The wise Gardener takes time by the forelock and attacks the pests with an efficient spray before they begin to multiply. He further shows his wisdom by selecting an insecticide of established reputation of which

## THE FINEST BEDDING DAHLIAS

The most popular and beautiful bedding plants of to-day. They provide masses of colour from time of planting until frost, and are unaffected by weather.——No stakes or tying required.

### COLTNESS GEM

Award of Merit, R.H.S.,  
after trial in their gardens at Wisley.

Bright deep scarlet-red single flowers  $3\frac{1}{2}$  to 4 inches in diameter, on strong, upright, wiry stems, 6 to 8 inches in length, carried clear of the foliage, covering itself with flowers; compact bushy habit, about 1½ feet in height.

<b>PRICES :</b>	doz.	100
Strong plants in small pots	6/-	45/-
Strong plants in $3\frac{1}{2}$ in. pots	7/6	55/-
Extra large in 5 in. pots	12/-	&15/-

### ADA

A magnificent clear beautiful yellow flower of faultless form. All that we say regarding 'Coltness Gem,' as to size of flower, stems, freedom of blooming and habit, applies equally well to this beautiful variety; by far the best of its colour.

<b>PRICES :</b>	doz.	100
Strong plants in small pots	7/6	55/-
Strong plants in $3\frac{1}{2}$ in. pots	10/6	80/-
Extra strong in 5 in. pots	15/-	—

All will bloom freely this season.

## DWARF BEDDING DAHLIAS

We have a very large stock of plants in fine condition.

**COLTNESS GEM** The most popular bedding Dahlia. Its brilliant scarlet flowers are produced in the greatest profusion during summer and autumn till frost comes. Habit dwarf and compact, height 18 inches. Plants from pots 12 for 7/-, 25 for 13/-, 50 for 25/-, 100 for 47/6. Carriage paid for cash with order.

**PAISLEY GEM** A new variety of the greatest merit. Flowers brilliant orange-scarlet with a double row of ray florets. It is quite as dwarf and compact in habit, and is even more floriferous than Coltness Gem. A decided acquisition which should be in every garden. Plants from pots, 12 for 13/-, 25 for 25/-, Carr. paid for cash with order.

*Catalogue of Hardy Scotch Grown Bedding plants may be had post free on application.*

London, E.C. 4.**

hedgerow, and they are thoroughly British; the double white and double lilac varieties are easily obtainable, and such beauties as the double sulphur, the double red (Madame Pompadour) and double purple will be found, if not in England, then in the Emerald Isle, where they have for long been favoured.

Of Roses, it may be written, as of the Carnation, that colour and form have been improved out of all knowledge and fragrance almost entirely neglected; very few modern Roses can compare with Cheshunt Hybrid, which was raised almost half-a-century ago, for scent. As I write, I can visualise from memory an old specimen of this Rose growing against the wall of an old West-Country mansion; in June, and again in autumn, every breeze that blew wafted the most exquisite fragrance through the open windows and, after all, fragrance is, perhaps, a flower's most precious quality. There is much that is restful and soothing in a garden filled with the scent of flowers, a true haven of rest from the humdrum of daily toil. The Mignonette—there is something beautiful even in its very name—and the Night-scented Stock, may be sown near to the house and will for long render the summer evenings sweetly reposeful; Tobacco plants possess an elusive and pleasing odour and the Honeysuckles, redolent of English woodland and beloved of bees, will be a joy the summer long.

Thymes and other low-growing odorous plants should obtrude on the path, and the slightest touch of passing feet will occasion a waft of moorland fragrance.

I would appeal to those flower-lovers who are in possession of old-world floral treasures to propagate and distribute them assiduously so that a goodly heritage may not be lost to breeders of popular flowers. I ask them to accept fragrance as their guiding star, and urge the leisured florist to search in the remotest hamlets of Britain for that most cherished possession, almost a tradition, the well-tendered and well-loved cottage garden, for from these humble homes many fine flowers and fruits have come, and there are still more waiting for the appreciative eye of those who seek them.

The scent of flowers is a wonderful thing, and an even more wonderful gift; it was appreciated by our grandparents, and the plants diffusing such scent were tended with meticulous care. There is a well-worn saying: "Any plant will grow for him"; those of whom this is said possess that indefinable gift of knowing their plants, of anticipating their every want, and this wonderful contact between plant and human has never been more marked than between the old-world favourites of the cottage garden and those who ministered to their wants. *Ralph E. Arnold.*

## ROSE GARDEN.

### APHIDES AND MILDEW.

A SHARP outlook should now be kept for attacks of aphides on Roses which, if allowed to increase are frequently very difficult to control; so soon as the fly is detected, the affected plants should be sprayed with an insecticide, a nicotine wash being most effective for the control of green-fly.

Where mildew was prevalent last season it is well to anticipate an attack this year by spraying with a suitable specific; one of the best sprays for mildew is liver of sulphur, used at the rate of half-an-ounce to one gallon of water, or two ounces to three gallons of water when the foliage is young and tender. A little soft soap added to the solution renders it more adhesive.

The surface of the beds should be kept well stirred with the hoe or cultivator; this not only serves the double purpose of aerating the soil and keeping down weeds, but a loose layer of soil conserves moisture and acts as a mulch during dry weather. I do not advise the use of mulching material for Rose beds at any time, as it prevents to a great extent the proper cultivation of the ground, which is so essential for successful Rose-growing. *J. C.*

## RAISING HARDY PERENNIALS FROM SEEDS.

ALTHOUGH the bulk of the hardy herbaceous plants may readily be increased by means of division or even cuttings, it is an excellent plan to raise stocks of both the larger-growing herbaceous plants, as well as the dwarf-growing subjects for the rock garden from seeds.

Many of the plants raised in this way will be ready for planting out in their permanent quarters during the autumn or following spring, but some of the slower-growing subjects will require a second season in the nursery.

Delphiniums are easily raised in this way, also many of the Campanulas, including *C. lactiflora*, a beautiful plant, not only for the wild garden, but also for the large herbaceous border. This species has large, fleshy roots, and should be planted in its flowering quarters

FIG. 178.—CHELSEA SHOW: ROSE GOLDEN SALMON.

This new variety was prominent in many of the collections of Roses.

Now that the bulk of propagation in connection with the summer bedding plants is over, there is more time and space for the raising of perennial plants. The seeds of most of them may, if desired, be sown in the open, but it is a great advantage if they are raised indoors, either in a cool house or in cold frames, sowing the seeds in pots or boxes according to the quantity of plants desired.

When large enough, the seedlings should be pricked off into boxes, from which they may subsequently be transferred to the nursery or reserve garden.

when quite young. *C. persicaefolia*, of which there are many fine varieties, is also easily raised from seeds, as is *Geum Mrs. Bradshaw*.

Seeds of a variety of hardy herbaceous perennials are easily obtainable from seedsmen, and most of them are not expensive.

Seeds of many alpine plants often take a long time to germinate, and if they fail to do so the first season, the seed-pans should be left out-of-doors during the winter, exposed to the influence of frost and snow. Usually, if the seeds are viable they will germinate the following spring. *J. C.*

# ROYAL HORTICULTURAL SOCIETY.

## EXHIBITION AT CHELSEA.

May 25, 26, and 27.

THE Spring Show of the Royal Horticultural Society held on Wednesday, Thursday and Friday of this week, in the grounds of the Royal Hospital, Chelsea, was the largest of the series, and the quality of the exhibits generally was superb. The Show was worthy of the Society and a testimony to the skill and enterprise of British gardeners.

The major portion of the exhibits consisted of beautiful flowers and flowering plants, which filled the tents with bright colours and perfumes, but all sections of gardening were represented, almost everything used in gardens or associated with horticulture being included. The new arrangements whereby the judging was completed on the Tuesday evening, and the Show opened for a private inspection of the Fellows on the Wednesday morning met with general approval; the show was so far advanced on Tuesday afternoon that the King and Queen were enabled to make a tour of inspection, and others present on the same day included Princess Mary, Lord Lascelles, and the Duke of Connaught. On the Wednesday morning the weather was beautifully fine; before the opening of the gates large crowds had assembled and it is estimated that the attendance on the first morning exceeded all records.

With regards to the Show itself, it occupied two-and-a-half acres more ground than the previous one, giving an additional area of 8,500 square feet. This increased space allowed for wider pathways in the tents, and added greatly to the comfort of visitors. The number of exhibits was 215, compared with 194 in 1926; sundries especially were more numerous, the figures being 99 last year and 144 this. One of the most notable increases was in the exhibits of shrubs.

Although the season has been unfavourable, there were several good exhibits of Tulips and Sweet Peas, and a great wealth of all kinds of border flowers. Rhododendrons were as beautiful as ever, and there were choice collections of Roses, Carnations, Hydrangeas, Irises, Begonias and other flowers. The rock gardens reached a high standard of merit and there were many beautiful formal gardens.

The Orchids were staged in a large tent by themselves and made a notable contribution to the Show.

The two sections of the Floral Committee made an unusually large number of awards, including three First Class Certificates and twenty-nine Awards of Merit. The Orchid Committee granted four First Class Certificates and twelve Awards of Merit to novelties.

The Fruit and Vegetable Committee made no award to a novelty, but there were several exhibits of outstanding importance in this section, including magnificent collections of vegetables staged by the Hon. VICARY GIBBS and Messrs. SUTTON AND SONS respectively, and a group of pot fruit trees by Messrs. T. RIVERS AND SON.

### Orchid Committee.

Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson, Mr. C. J. Lucas, Mr. H. G. Alexander, Mr. J. Cypher, Mr. R. Paterson, Mr. E. R. Ashton, Mr. S. W. Flory, Mr. W. H. Hatcher, Mr. A. Dye, Mr. T. Armstrong, Mr. John Cowan, Mr. F. K. Sander, Mr. Clive Cookson, Mr. J. E. Shill, Mr. R. G. Thwaites and Mr. Stuart H. Low.

### FIRST CLASS CERTIFICATES.

*Lycaste Skinneri* var. *Mrs. Hamilton-Smith*.—From Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey. This is by far the finest form of this well-known and beautiful species; the flowers

are exceptionally large and effectively coloured.

*Odontioda Corregio* (Oda. *Coronation* × Oda. *Vuylstekeae*).—From J. J. BOLTON, Esq., Claygate, Surrey. A beautiful variety; the plant carried a spike of six large flowers which are rose-tinted and blotched with rose-purple; the spiny crest is bright yellow.

segments are prettily arranged and coloured soft rosy-mauve, and with rich purple on the lip.

### AWARDS OF MERIT.

*Miltonia Conqueror*.—From Messrs. SANDERS, St. Albans. The spikes bore several well-formed flowers of light blush tint, with a bold

FIG. 179.—CHELSEA SHOW: ODONTOGLOSSUM IMPERATOR.

Shown by Messrs. Charlesworth & Co.

*Miltonia Lucia* var. *Stamperland*.—From ROBERT PATERSON, Esq. An elegant flower, particularly rich in its crimson colouring; the labellum is broadly developed and has a distinct blotch at the base.

*Cattleya Prince Shimadzu* var. *superba*.—From Mrs. ROBERT PATERSON. A very charming form of this well-known hybrid; the

and darkly coloured blotch at the base of the labellum.

*Odontoglossum eximium* var. *Colmanii*.—From Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey. A very distinct hybrid with circular blotches, derived from *O. crispum* Solum, and likely to improve greatly when the plant reaches maturity.

*Odontonia Corona* var. *Rajah* (M. Warscewiczii × *O. Harryanum*).—From Messrs. CHARLES-WORTH AND CO. The branched spike bore numerous flowers of yellow ground with dark chocolate blotching; a very distinct hybrid.

*Vuystekeara Melba* var. *atropurpurea* (V. Brevii × *O. Gorizia*).—From Messrs. CHARLES-WORTH AND CO. A great advance in the section. The flowers are large and of uniform rose-purple.

*Cymbidium. Erica* var. *Lord Lambourne*.—From Messrs. STUART LOW AND CO. The arched spike bore several charming flowers of clear canary-yellow colour; the lip has a few reddish spots.

*Miltonia Sanderiana* var. *Chelsea*.—From Messrs. BLACK AND FLODY. A very beautiful hybrid; the labellum of the rose-coloured flowers is well-covered with radiating lines of dark crimson.

## CULTURAL COMMENDATIONS.

To Mr. S. LYNE, Orchid-grower to J. J. Bolton, Esq., Claygate, for *Odontoglossum crispum* var. *Drussila*; to W. J. B. VAN DE WEYER, Cliffe, Dorchester, for *Eulophia purpurea*, with a tall spike; to Mr. J. COLLIER, gardener to Sir Jeremiah Colman, Bart., for a magnificent specimen of *Dendrobium Gattton Sunray*; and to Mr. A. F. BUSH, gardener to E. Sinclair, Esq., Chislehurst, Kent, for a plant of *Vanda Parishii*, with eleven spikes.

## GROUPS.

An interesting group was shown by Sir JEREMIAH COLMAN, Bart. (gr. Mr. J. Collier), Gattton Park, Surrey (see Fig. 180), who included a very fine series of *Lycaste Skinneri*, varying from pure white to rose-purple, and also the rare *L. locusta*, with green flowers.

as the pretty *Epidendrum Endresii*, added to the general effect.

J. J. JOICEY, Esq. (gr. Mr. J. Mackay) The Hill, Witley, had an interesting exhibit containing *Dendrobium cariniferum*, *D. transparens*, and two good specimens of *D. atrovioleaceum*. Rarities were staged in *Aerides Houlletianum* and *Cryptochilus sanguineas*, and pretty flowers in *Cypripedium Phipps*, ivory-white, and *Cattleya Mendelii* var. *White Queen*. *Bulbophyllum macranthum* and *Pleurothallis Birchenalii* were also included. The popular *Laelio-Cattleya Canhamiana* was seen in varieties with white sepals and petals, and in L.-C. Padova, the labellum is rich crimson.

One of the corner positions was occupied by Messrs. J. AND A. McBEAN, Cooksbridge, Lewes, with a choice selection of hybrids. Various *Cymbidiums* and *Miltonias* of the vexillaria section were most effective, while

FIG. 180.—CHELSEA SHOW: GROUP OF ORCHIDS EXHIBITED BY SIR JEREMIAH COLMAN, BART.

*Miltonia gloriosa superba*.—From Messrs. COWAN AND CO. A remarkable flower, the sepals and petals of which are marked with rich purple while the labellum has a dark crimson blotch surrounded by a bright zone.

*Miltonia Wm. Pitt* var. *Brilliantissima*.—From the Executors of the late Mr. H. T. PITT. A distinct flower in which the basal blotch on the labellum is well developed.

*Miltonia Kennie*.—From Messrs. SANDERS. A handsome flower, prettily formed and coloured, the distinguishing feature being the immense blotch of dark maroon on the labellum.

*Odontoglossum Prince Imperial*.—From Messrs. J. AND A. McBEAN. One of the finest of the blotched section; the flowers are of large size and handsomely coloured.

*Brasso-Laelio-Cattleya Ursula* var. *magnifica*.—From Messrs. H. G. ALEXANDER, LTD. The flowers are of great size, with rosy-mauve sepals and petals, and a deep purple lip.

*Cattleya Jupiter* (*Edith* × *Tityus*).—From Messrs. H. G. ALEXANDER, LTD. A charming flower of soft mauve colour; the lip is rich purple and with an orange throat.

A pretty hybrid was seen in *Angulocaste Vesta*, while *Odontiodas* were fairly well distributed. Among the *Cattleyas* were white varieties of *C. Mendelii* and Temple's variety of *C. Skinneri*. The centre was well filled with *Cymbidiums*, in front of which were placed *Dendrobium acuminatum* and several scarce *Masdevallias*. *Dendrobium Gattton Sunray* and *D. densiflorum* were both attractive. A fine effect was produced by large plants of *Brasso-Laelio Caligula* and *B.-L.-C. Veitchii*, the latter with eight immense flowers. Numerous *Cypripediums* of the emerald green section were tastefully placed, while at other points were the bright golden flowers of *Odontoglossum Wilckeanum Colmanii*, and the richly-coloured blooms of the new *Miltonia* hybrids.

From the Executors of the late H. T. PITT, Esq. (gr. Mr. Thurgood) came a pretty group, mainly composed of *Miltonia vexillaria*, among which were arranged some fine *Cattleya* hybrids. Well-cultivated specimens of *Anguloa Clowesii*, with cradle-like flowers, and the handsome *Maxillaria Sanderiana* came in for appreciation. *Renanthera lmschootiana*, with a panicle of red flowers, *Odontonia Nubia*, as well

*Cattleya Enid alba*, *C. citrina*, and the red-flowered *Masdevallia Veitchiana* stood out boldly. *Odontoglossums* were best seen in *O. Prince Imperial*, with immense flowers; in *O. crispum* var. *Cecilia*, and in the shrubby variety of *O. illustrissimum*. Two finely-grown specimens of *Coelogyne Stanny* (*burfordensis*) were prominent objects. Of the many *Odontiodas*, the finest seemed to be *Oda. Lawrecler*.

Messrs. COWAN AND CO., Southgate, filled the central area of their group with *Odontiodas* with good effect. *Odontoglossum triumphans* var. *L. Crawshay* was in fine form, as also were several varieties of *Cattleya Wolstersiana* and *C. Tityus*. *Dendrobium Devonianum* made a fine show with a multitude of blooms, while *D. Victoriae Reginae* bore flowers of slate-blue colour. *Coelogyne Mooreana*, with an erect spike of white flowers, and *Selenipedium grande*, were much noticed, while *Laelio-Cattleya Aphrodite* and L.-C. *Hyeana* again proved useful. Mention may also be made of some choice *Odontiodas* and the rare *Cattleya intermedia* var. *Aquinii*.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, put up an interesting exhibit, comprising

the new *Odontioda* Canberra, with large purplish flowers; *Laelio-Cattleya* Locarno var. Eileen rose-purple, with deep crimson lip, L.-C. Cantab var. Atlas, roundly formed, and *Odontocidium* Edwardatum. Among the species were *Cymbidium* Devonianum, with three spikes, *Maxillaria* tenuifolia, the red-flowering *Renanthera* Imschootiana, and *Anguloa* Clowesii. A distinct *Cymbidium* was staged in C. Erica var. Lord Lambourne, and an interesting hybrid in *Rolfeara* Charm, with flowers of apricot-yellow.

Messrs. SANDERS, St. Albans, occupied a corner position with a showy exhibit of *Miltonia* vexillaria, an outstanding variety being named Conqueror, with a heavy blotch on the base of the labellum. *Phalaenopsis* Rimestadiana, with white, moth-like blooms, the rare *Paphinia cristata*, *Bifrenaria* pubigera, and the quaint *Nanodes* Medusae may be mentioned. A remarkable Orchid was seen in a well-flowered specimen of *Bulbophyllum* macrobulbon, and another in *Cymbidium* Huttonii, with a couple of pendulous spikes. *Aerides* Fieldingii and *A. falcatum* var. expansum, both uncommon, came in for due appreciation. Of the many *Odontiodas*, one named Queen Mary had a fine inflorescence, while in *Oncidiodes* Mauricei, the white lip stood strongly against the deep rose sepals and petals.

Messrs. CHARLESWORTH AND CO., Haywards Heath, filled the opposite corner with a very attractive exhibit, in which the central part was filled with home-raised forms of *Odontoglossum* crispum, one particularly fine variety having a spike of eighteen large flowers. Probably the best of the hybrids was *Odontoglossum* Imperator (see Fig. 179) of wonderful formation and rich purple colour. A pleasing contrast was made by the golden flowers of *O. Wilckeanum* aureum. Masses of *Laelio-Cattleya* G. S. Ball, bright orange, and of L.-C. Hyeana, dark purple, stood out well. An interesting hybrid was staged in *Vuystekeara* Melba, with large flowers of rose-purple. Another part of this group was made up with various *Cypripediums*, *Epidendrum* gattonense, and the showy *Coelogyne* Stanny (burfordiensis).

Messrs. BLACK AND FLORY, Slough, had an attractive group of *Miltonia* vexillaria hybrids, the best being Kennie, with ray-like markings; Wm. Pitt, richly coloured; and some well-flowered specimens of *Doris*. *Cattleyas* were the other outstanding feature, and included distinct varieties of Dr. G. G. MacDonald, well-coloured forms of C. Tityus, the pleasing C. Cowanae alba, and C. Prince Shimadzu. One of the most interesting plants was the new *Burrageara* Windsor, while two other novelties were staged in *Miltonia* Era (*Doris* × *Lena*), and *Laelio-Cattleya* H. B. Turner.

Messrs. SUTTON BROS., Hassocks, exhibited some attractive plants in their group, such as *Dendrobium* thysiflorum, with masses of yellow blooms; *Laelio-Cattleya* Fascinator, *Odontiodas* Grisell, *Brasso-Cattleya* Digbyana Mossiae, and *Cymbidium* Ceres. Species were represented by *Pholidota* imbricata, *Scuticaria* Hadwenii and *Ophrys* aranifera. Messrs. MANSELL AND HATCHER, LTD., Rawdon, Yorks., had an attractive group composed of numerous seedlings of *Miltonia* vexillaria, some very promising, with various *Odontiodas* and *Odontoglossums*. Other plants of interest were *Vanda* Bensonii, *Zygopetalum* crinitum, *Anguloa* Clowesii and *Saccolabium* Blumei. The centre of the group was tastefully filled with *Odontoglossums* and *Odontiodas*.

Messrs. H. G. ALEXANDER, LTD., Westonbirt, Tetbury, Gloucestershire, put up a fine show in one of the corner positions. Noteworthy plants were the Westonbirt variety of *Cattleya* Tityus, with a spike of five flowers; *Cattleya* Enid var. Gloriosa, and several fine forms of C. Mossiae, a finely grown specimen of *Miltonia* vexillaria var. Snowflake, with many snow-white flowers; and M. Hyeana var. Venus evoked much praise, as also did the large examples of *Brasso-Laelio-Cattleya* Ajax. *Cymbidiums* were well represented, as also were *Cypripediums*, for the time of year. Among the species we noticed the tall *Dendrobium* Dalhousieanum, and the dwarf *Phalaenopsis* Lueddemanniana.

Messrs. CYPHER AND SONS, Cheltenham, arranged a varied exhibit of species and hybrids. Among the former were *Cattleya* Mossiae Wageneri, a specimen plant of *Brassia verrucosa*, *Renanthera* Imschootiana, and the yellow-flowering *Dendrobium* chrysotoxum. Hybrids were best seen in the popular *Laelio-Cattleya* Dominiana, with five flowers on the spike, *Sophro-Cattleya* Hector, of reddish tint, many *Odontoglossums*, both plain and blotched, as well as a selection of the decorative *Odontiodas*.

Mr. HARRY DIXON, Wandsworth Common, had an attractive exhibit in which one end was filled with *Cypripedium* species and hybrids, including C. Curtisii exquisitum, C. callosum and C. Maudiae. In the centre was a fine plant of *Odontioda* Gladys, with no fewer than forty-three flowers on the spike. Other notable Orchids were *Dendrobium* thysiflorum, with seven racemes, the pretty D. japonicum, *Maxillaria* tenuifolia, and fine varieties of *Cattleya* Tityus. *Selenipedium* Dominianum and S. macrochilum were also staged.

#### Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Chas. E. Pearson, Mr. H. R. Darlington, Mr. W. B. Gingell, Mr. J. T. West, Mr. D. B. Crane, Mr. James B. Riding, Mr. J. M. Bridgeford, Mr. M. C. Allwood, Mr. Donald Allan, Mr. H. J. Jones, Mr. W. H. Page, Mrs. Ethel M. Wightman, Mrs. Helen Lindsay Smith, Mr. Wm. Howe, Mr. Geo. Churcher, Mr. Arthur Turner, Lady Beatrix Stanley and Mr. A. E. Vasey.

Section B.—Mr. W. J. Bean (in the chair), Mr. F. G. Preston, Mr. Amos Perry, Mr. G. Yeld, Mr. W. G. Baker, Mr. Geo. Harrow, Mr. J. Reuthe, Mr. T. Hay, Mr. Hiatt C. Baker, Mr. L. R. Russell, Mr. Mark Fenwick, Mr. Chas. T. Musgrave, Mr. E. H. Wilding, Mr. C. W. Williams, Mr. R. D. Trotter, Sir William Lawrence, Bt., Hon. Henry D. McLaren, Mr. Reginald Cory, Mr. W. B. Cranfield, Mr. A. Bedford, Mr. F. C. Stern, Mr. Eric M. Marsden-Jones, Mr. E. A. Bowles, Mr. R. C. Notcutt, Mr. Chas. Lucas, Mr. A. W. Exell and N. K. Gould, Secretary.

#### FIRST CLASS CERTIFICATES.

*Azalea* John Jennings.—This appears to be one of the brilliant Knap Hill hybrids. It makes a neat truss of flowers, rather larger than those of the Ghent Azalea, and of vivid ruby crimson colour. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Hants.

*Cornus florida* var. rubra.—Although not generally hardy, *Cornus florida* thrives in various parts of this country, and the very beautiful variety rubra appears to be more suitable for our climate than the type shrub. It was first introduced by Messrs Parsons, of Flushing, New York. It differs from the type in the large bracts being lined and flushed with bright pink. The figure in *Bot. Mag.*, t. 8,315, shows the variety to rather better advantage than did the sprays now exhibited. Shown by LIONEL DE ROTHSCHILD, Esq.

*Daphne aurantiaca*.—This beautiful little shrub was introduced by Forrest and raised in the Royal Botanic Gardens at Edinburgh, where it thrives out-of-doors. It is a sturdy evergreen shrub bearing small, stiff, ovate leaves, about three-quarters-of-an-inch long. The flowers, which have fairly long tubes, are borne in pairs in the axils of the leaves, and are of bright yellow colour. They have a slight *Daphne* perfume. Shown by Mr. A. K. BULLEY.

#### AWARDS OF MERIT.

*Lewisia rediviva* Vancouver variety.—On account of its fleshy rootstock, this *Lewisia* has great powers of recuperation; dried specimens have been known to throw up fresh leaves after having been dormant for over two years. The plant makes a tuft of narrow, succulent leaves, from which spring short-stemmed, pink flowers, nearly three inches across and of Cactus-like appearance. The whole plant was not more than three inches in height. There is a good illus-

tration of the type plant in *Bot. Mag.*, t. 5,395. Shown by Mr. C. VAN TUBERGEN.

*Primula microdonta* var. *alpicola* (see Fig. 181).—This is a handsome Chinese Primrose. The entire, ovate leaves have long petioles. The stout scape is about two feet in height and bears plenty of lemon-yellow flowers on fairly long, erect stalks which curve close to the calyx so that all the flowers face nearly at right angles. The stems are slightly mealy. Shown by Messrs. OLIVER AND HUNTER.

*Carnation* G. K. Phillips.—A large, shapely perpetual-flowering variety of rich crimson colour and delicious perfume. Shown by Messrs. HEWITTS, LTD.

*Carnation* Evelyn.—A well-formed perpetual-flowering *Carnation* of medium size and slight fragrance. The petals are heavily stippled with bright pink, and the white ground shows occasionally in the form of white lines and flakes. Shown by Messrs. C. ENGELMANN, LTD.

*Paeonia* Moutan Hiatt C. Baker.—This Tree Paeony bears rather small, rounded orange-stained flowers. Shown by the ALMONDSBURY GARDENS.

*Rhodohypoxis* Bauri.—The generic name does not appear in the *Index kewensis* so must be considered provisional. The plant is very dwarf and has a tuft of hairy, acaulescent, lanceolate leaves, from which spring single, dull white flowers, which have somewhat the appearance of blind Primroses—the corolla segments meet in the centre of the flower.

*R. rubella*.—This is similar to the foregoing, except that the flowers are rose-coloured. Both were shown by Mrs. GARNETT-BOTFIELD, Albrighton.

*Weinmannia trichosperma*.—This uncommon shrub usually requires the protection of a cool greenhouse. The pinnate, angular, flattened leaves give a Fern-like appearance to the foliage. The terminal racemes are studded with small flowers, which have pink-tipped anthers. Shown by G. W. E. LODER, Esq., Ardingly, Sussex.

*Aponogeton distachyon aldenhamense*.—This is merely a coarse variety of the deliciously-scented Cape Pond Weed, or Winter Hawthorn, as this uncommon aquatic is often termed. Shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, Herts.

*Clerodendron fragrans*.—The chief value in this warm greenhouse plant lies in the rich fragrance of its flowers, but we suspect it is rarely grown outside Botanic Gardens. The plants have very large, sub-cordate pubescent leaves and a squat, terminal corymb of white flowers. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

*Hippeastrum pratense*.—This Chilean bulbous plant, which was introduced in 1840, was shown as *Habranthus pratensis*. The brilliant scarlet flowers are borne in umbels on stems about a foot high. Shown by Mr. R. C. NOTCUTT.

*Pitcairnia aphelandraeflora*.—An attractive dwarf Bromeliad introduced from Para in 1867. The lanceolate leaves are soft in texture, dark green, and are lightly toothed towards the ends. There were eight racemes of bright scarlet flowers. Shown by Sir WILLIAM LAWRENCE, Bt.

*Cercis racemosa*.—Like the better-known *Cercis Siliquastrum*, this species bears its flowers on the branches, but they are in pendulous racemes. The individual flowers are rather smaller and of flesh-pink colour. The young shoots and flower buds are downy. It is a beautiful little deciduous tree, growing about twenty feet in height and was introduced from Hupeh, China, in 1907. Shown by LIONEL DE ROTHSCHILD, Esq.

*Magnolia Nicholsoniana*.—This deciduous species, from China, grows about twenty feet high and flowers when quite young. The ovate-oblong leaves have fine hairs on their petioles and undersides of the midribs. The saucer-shaped, white flowers are fully four inches across and have purple stamens. Shown by LADY ABERCONWAY and the Hon. HENRY D. McLAREN (gr. Mr. F. C. Puddle), Bodnant, North Wales.

Illustrated  
Catalogue free

C. T. OVERTON &amp; SONS, Crawley, Sussex

*Cytisus Lord Lambourne*.—A graceful, free-flowering Broom much of *C. Dallimorei* type. The standards and keel are coloured primrose, and the wings are bright crimson. Shown by Messrs. C. WATSON AND SONS, LTD.

*Azaleodendron Galloper Light*.—A very handsome hardy, deciduous variety which bears good trusses of rosy-salmon flowers with crimson spots on the upper segment. Shown by LIONEL DE ROTHSCHILD, Esq.

*Viburnum macrocephalum*.—A deciduous shrub of fair size, from China. The small, ovate-oblong leaves are dark green. The bush bears large, rounded trusses of pure white, sterile flowers of Hydrangea-like appearance. Shown by LIONEL DE ROTHSCHILD, Esq.

*Lupinus polyphyllus Countess of March*.—This fine variety has tall spikes of flowers which are white at first, but later become flushed with lilac. Shown by Mr. G. R. DOWNER.

*Hydrangea Hortensia D. B. Crane*.—A large truss of substantial flowers of deep old rose colour. Shown by Mr. H. J. JONES.

*H. Mrs. Baardsi*.—A large, shapely truss of bright pink flowers.

*H. Deutschland*.—This variety has an immense truss of pink flowers, very lightly shaded with blue. Both were shown by Messrs. L. J. ENDTZ AND CO.

*Carnation E. Lyall Swete*.—A magnificent border Carnation. The large flowers are very shapely and of bright scarlet-crimson colour. Shown by Mr. JAMES DOUGLAS.

*Dianthus Allwoodii Susan*.—A shapely little flower of bluish pink colour. There is a substantial deep crimson zone. Shown by Messrs. ALLWOOD BROS.

*Aster alpinus Shirley*.—Although only about six inches in height, this splendid variety bears bright mauve-coloured flowers, nearly three inches across. Shown by Messrs. B. LADHAMS, LTD.

*Viola cornuta Jersey Gem*.—This is an excellent variety of compact, yet spreading, habit. The flowers are unusually large for the type and of royal blue colour. Shown by Messrs. WATKINS AND SIMPSON.

*Rose Kersbergen*.—A showy Polyantha variety. It bears a shapely, conical truss of double, rich crimson flowers. Shown by Messrs. WM. CUTBUSH AND SON.

*Begonia Mrs. A. Baldwin Bantock*.—A magnificent, tuberous-rooted, double-flowered variety. The very large, perfectly-formed flowers are of rose-pink colour, shaded with orange and are prettily waved.

*B. Mrs. F. Bedford*.—Another splendid variety of similar type to the above. The colour is cream flushed at the back and on the margins with Apple-blossom pink. Both varieties were shown by Messrs. BLACKMORE AND LANGDON.

*Tulip White Duchess*.—A very large, Cottage Tulip. The broad segments are occasionally notched, and of creamy white colour, with green lines along the centre at the back of the segments. Shown by Messrs. BARR AND SONS.

#### Stove and Greenhouse Plants.

While there were only two exhibits of stove plants, these were wholly admirable. Messrs. JOHN PEED AND SON arranged a splendid collection of Caladiums which included many new varieties. The chief of these were Mr. Robert Greenfield, Leopold, Roupell Glory, Streatham Pride, Stromboli and Fiery Cross, all of semi-transparent loveliness. Amongst the older varieties we especially noted Marquis of Camden, John Peed, Red Ensign, Henry Lovat and John Burns. The level of these exceedingly well-grown Caladiums was broken by excellent plants of Phoenix Roebelinii and Cordyline (Dracaena), Victoria. Along the front, Messrs. JOHN PEED AND SON arranged a very large collection of the splendid Streptocarpus which received such great admiration at previous shows in Vincent Square, and many equally well-grown plants of an admirable strain of Gloxinia. They also showed their vigorous, double-flowered, velvety purple Petunia, Mrs. John Campbell, and margined the group with Coleus Wittonii, Selaginellas and Asparagus plumosus nana.

Nearby, Messrs. L. R. RUSSELL, LTD., displayed a magnificent collection of miscellaneous stove plants. Caladiums of good quality were an important feature, as also were many good varieties of Codiaeum (Croton) and Cordyline (Dracaena). Vivid colour was provided by the scarlet spathes of Anthurium Scherzerianum Lord Lambourne and A. S. Russelliana. Of special note amongst the foliage plants was a pan of the charming little Anoectochilus petiola. Flowering plants included Clerodendron Balfouri, Francisceas, Medinilla magnifica and various Bromeliads bearing brilliant bracts. Adjoining these stove plants was a

comprehensive collection arranged by Mr. SYDNEY SMITH. This included well-grown plants of Mamillaria Schiedeana, M. coronaria, M. micromeris, Echinocactus Grusonii, E. pilosus, E. chrysanthus, Cereus (Pilocereus) senilis, Echinopsis, Euphorbias, Echeverias and Cotyledons.

Hydrangeas were extensively shown and in superb quality. The three exhibits, solely of Hydrangeas, splendidly illustrated different styles of arrangement. Mr. H. J. JONES favoured the moderately level method, broken by a delightful centre of vividly coloured plants of Parzival and selections, at the four

FIG. 181.—CHELSEA SHOW: PRIMULA MICRODONTA VAR. ALPICOLA.

(see p. 376).

most pleasant group of Tree Ferns, largely of Dicksonia antarctica, with an occasional Cyathea dealbata rising high above more lowly Ferns and Bromeliads.

Hippeastrums were especially well shown by LADY ABERCONWAY and the Hon HENRY McLAREN (gr. Mr. F. C. Puddle), Bodnant, North Wales. These excellent plants were delightfully arranged in a variety of splendid colours, and illustrated a desirable strain as well as first-rate cultivation. In a row of Streptocarpus which was arranged along the front of this exhibit, there were many good specimens, principally of purplish shades, which were also worthy of admiration.

The only exhibit of succulent plants was a

corners, of his charming seedlings, while specimen plants were disposed in approved places. His principal varieties included Le Cygne, white; Rubis, rich pink with bronzy-green centres; Elmar, frilled pink; Thos. Stevenson, a large truss of soft pink flowers; Blue Prince, of hazy blue shading over pink ground; Peer Gynt, of Geranium pink colouring; and Heiderosee, a very large truss of medium pink colour.

Nearby, BARON BRUNO SCHRÖDER (gr. Mr. E. J. Henderson), The Dell, Egham, displayed a handsome bank of well-grown Hydrangeas, with occasional raised vases of selected specimens which made an effective display. Amongst the many varieties were Parzival, Maréchal Foch, crimped, pink; Goliath, an immense

truss; Madame Vonon, pink flushed with mauve; Madame Moulliere, with a violet eye; and Hydrangea Maresii.

At the far end of the same tent Mr. PHILIP LADDS had a most delightfully arranged group of Hydrangeas. We understood that Mr. H. Jolis, Managing Director of Messrs. Silvesters, was responsible for the arrangement, and that the exhibit was intended to follow the lines of the recent displays of the British Florists' Federation in illustrating the best varieties grown for market sale. As in the other collections, the variety Parzival was splendidly shown, and this filled a large central basket. Other ornamental baskets contained plants of such varieties as Madame Moulliere, Madame Truffaut and Madame A. Riverain, blue; and Madame Chautard, pale pink. Hydrangeas were also shown by many other exhibitors in association with various plants.

On this occasion, Messrs. SUTTON AND SONS confined their exhibit to a display of Salpiglossis (Fig. 182). Thirty-six distinct varieties were represented, and these were arranged in a series of bold, undulating groups in the centre of No. 1 Tent. This most comprehensive and best collec-

varieties and Salpiglossis of considerable merit. These gave way to dwarfier, but equally meritorious plants of large-flowered Calceolarias, Nemesias in many delightful shades of colour; Statice palmata, Primula obconica grandiflora, of great excellence; and dwarf Cactus Cinerarias, in a great range of colours.

A well disposed exhibit of Calceolaria integrifolia and small-flowered hybrids of great beauty, was made by Mrs. SHEPPEE (gr. Mr. W. Limmer), Holly Spring, Bracknell, and Mrs. DENNY (gr. Mr. Thrower), Hornwood House, Bucks., had a tasteful arrangement of Calceolaria integrifolia and Statice profusa.

THE STUDELY HORTICULTURAL COLLEGE exhibit was composed of Clarkia elegans, Rehmannia angulata, with a few plants of exceptionally bright colour; Statice Suworowii and Hydrangeas. The central place was given to an admirable collection of Brompton Stocks. The group, which was edged with Isolepis gracilis, was arranged with skill and taste.

A magnificent collection of tuberous-rooted Begonias was arranged on the staging by Messrs. BLACKMORE AND LANGDON. On the

FIG. 182—CHELSEA SHOW: A CORNER OF MESSRS. SUTTON AND SON'S GOLD MEDAL GROUP OF SALPIGLOSSIS.

tion of Salpiglossis that has ever been shown, was most fascinating in the charming and delightful colourings of the flowers. Every possible shade and combination of colours were to be seen, but those which seemed to be the most popular were Velvet Red, of intense velvety colouring, the association of Heliotrope, crimson and gold, the self yellow and the rosy-crimson. But there were many others equally delightful in the intensity of their colours and markings, while every plant was a perfect example of the highest cultural skill.

At the Embankment end of the tent, Messrs. J. CARTER AND Co. had a series of three very charming groups of greenhouse plants linked up with arches of Sweet Peas. In the larger, middle group, they had bold masses of Clarkia Brilliant Princess, Rehmannia angulata and Schizanthus var. Pink Shade merging into smaller groups of Petunia Rose Queen, Gloxinias and Begonias of good strains, and the whole edged with velvety grass and a row of an Ageratum of graceful habit. In the secondary groups were displayed Irises, Salpiglossis, Cinerarias and Calceolarias.

An extensive exhibit, arranged by Messrs. WEBB AND SONS, contained generous batches of well-flowered greenhouse plants. In the background there were tall plants of Clarkia, of rich salmon colouring; Cineraria stellata

present occasion it seemed that these well-known growers excelled even themselves in the excellence of their plants. The flowers, which in the main part of this very imposing exhibit were double, were immense in size, but very shapely and of many beautiful shades of colour. The chief were Lord Lambourne, orange shades; Hilda Langdon, shell pink; Brian Langdon, deep rose-pink; Peace, cream; Sidney Robinson, orange; Betty Hampton, rosy salmon; Mrs. Peter Blair, white, and Grand Monarch, rich, deep crimson. Over these superb plants were suspended baskets of equally meritorious plants of pendulous habit. There were Mollie, blush; Lena, red; Mrs. Bilkey, orange, and Corallina, pale coral.

Zonal Pelargoniums, as greenhouse plants, seem to have lost favour with gardeners during past years, so that extensive exhibits are not now looked for, but Mr. W. A. R. CLIFFON illustrated, in his exhibit of trusses of many varieties, their decorative value. The central position was given to several vases of a new variety, Nouvelle, which bears large trusses of orange-coloured flowers which have a white eye. Chief amongst the older varieties were Mars, of rich colouring; Venus, Janet Scott and Sensation. Besides these he had a grand selection of double-flowered varieties.

## Roses.

A large group, arranged by Messrs. CHAPLIN BROS., provided a mass of glorious colouring. The side wall of the marquee was hidden by profusely-flowered Polyantha varieties, such as Dorothy Perkins, Hiawatha, Excelsa, and Paul's Scarlet Climber, while along the centre of this large group there were tall standards of similar varieties rising above excellent plants of Hortulanus Budde, Mabel Morse, Beattie Chaplin, Mrs. Henry Bowles, Betty Hulton, Lady Hillingdon and many other valuable Roses. Below these tall plants was massed a ground-work of dwarf plants of Scarlet Leader, Annie Miller, Susanne Müller, Superba and Girlie, behind the front rows of John Henry, Souvenir de Claudius Pernet, Mrs. Atlee, Vera, Fascination, Shot Silk and Mrs. Tresham Gilbey.

On a large ground space, Mr. ELISHA J. HICKS had an attractive group of Roses in pots. There were tall standards of Mary Hicks, Orange King, Shalimar and other free-flowering sorts rising above dwarfier plants of Golden Salmon (Fig. 178) Dainty Bess, Dorothy Dix, Paul's Scarlet Climber, Souvenir de Claudius Pernet, Angele Pernet and many other good garden Roses.

A large corner space was attractively filled by Messrs. WM. CUTBUSH AND SON with a graceful group of Polyantha Roses and Hydrangeas. The Roses included floriferous plants of Kersbergen, crimson; Frank Leddy, bright pink; Golden Salmon (Fig. 178), Salmonea, Mary Casant, pale salmon; Scarlet Leader and La Reine Elizabeth, crimson. The chief Hydrangeas, which were arranged with well-coloured Japanese Maples, were Helge, Lorley, Marechal Foch and Parzival.

Their recent H.T. variety, Capt. S. Harvey Cant, was represented by Messrs. FRANK CANT AND Co., with several fine plants bearing large pink flowers. There was also a goodly batch of Lord Lambourne and Mrs. Henry Bowles of the same type, while a profusion of bloom was provided by Mrs. Anthony Kluis, a showy Polyantha variety, and Kirsten Poulsen, a single rose-coloured variety, which lasts for a considerable time.

On the staging, Messrs. B. R. CANT AND SONS displayed good examples of Padré, Mrs. Beatty, Sovereign, Souvenir de Claudius Pernet, Hilda, a deep rose-pink H.T., Margaret Spaul, of soft salmon shading; Phoebe, lemon-yellow; Lady Wakefield, orange-salmon shades, and Cecil, a rich yellow. Mr. GEORGE PRINCE had floriferous sprays of the yellow Banksian Rose, and also showed typical examples of Golden Salmon and Rosa Hugonis.

A good selection of standard varieties staged by Messrs. E. PAUL AND Co., included Ophelia, Molly Sharman Crawford, Mrs. Aaron Ward, Madame Abel Chatenay, America, Hoosier Beauty, Covent Garden, Los Angeles and Colonel Oswald Fitzgerald. Free-flowering Roses were displayed by Mr. J. H. PEMBERTON, who had good specimens of Ideal, Chatillon Rose, Echo, Golden Salmon, Corry Koster and Edith Cavell.

The chief feature of Mr. WALTER EASLEA'S exhibit was his variety Thelma, which was awarded the Cory Cup last year; this was represented by many large plants. He also showed Amami, a new H.T.; W. A. Bilney, a pink flushed H.T.; Thora, M. A. Kluis, a dwarf Polyantha, and Orange King.

## Carnations and Pinks.

Several growers of Carnations set up imposing collections which contained an immense number of fresh and beautiful flowers. Messrs. C. ENGELMANN, LTD., placed their flowers in a series of tall pillars, which made a most effective display. In addition to several unnamed seedlings of considerable value, they had large quantities of Nigger, Saffron, White Enchantress, White Wonder, Red Laddie, Dainty, a pretty Fancy variety; Lady Northcliffe, Spectrum and Aviator.

The collection of Messrs. ALLWOOD BROS. was arranged on the staging in graceful undulations, surmounted by hanging baskets filled with a generous profusion of flowers. Their principal varieties were George Allwood, Spectrum, Velvet, a new Fancy variety of rich red colour with crimson stripes; Master Michael

Stoup, Butterfly, a fragrant Fancy with red flakes on a white ground; Eldora, white ground Fancy which they consider to be the most fragrant of all greenhouse Fancy Carnations; Red Laddie, Shot Silk, a red and crimson Fancy, and a selected strain of Mary Allwood. On a ground space near by, Messrs. ALLWOOD had a garden of Border varieties and *Dianthus Allwoodii* which was also very effective. The Border sorts included Lord Stern, yellow Fancy; Lieut. E. Shackleton, Grenadier, scarlet; and Skirmisher, yellow ground Fancy. Chief amongst the *Dianthus* were Arthur, Peggy, Fred and Phoebe. One corner was devoted to a good selection of alpine Pinks.

In their collection, Messrs. KEITH LUXFORD AND Co. displayed goodly vases of such perpetual-flowering Carnations as Topsy, Tarzan, Saffron, Circe, Sheila Greer and Mrs. Hamilton Fellowes. Mr. A. F. DUTTON staged several large vases filled with his new rich crimson and fragrant variety, Mrs. A. J. Cobb.

An extensive collection of Border Carnations with some Auriculas was displayed by Mr. JAMES DOUGLAS. The chief Carnations were Winsome Clove, Cleopatra, Mrs. Audrey Campbell, Ravenswood, Fair Ellen, Bookham Rose, Princess Mary, Bookham White, Steerforth, Red Gauntlet and Rhoderic Dhu.

In a collection of his admirable garden Pinks, Mr. C. H. HERBERT included a good selection of new varieties of great beauty. The chief of these were Queen Mary, deep blush with crimson zone; Conquest, ruby crimson; Majestic, a large deep rose-pink flower; Novelty, a shapely crimson lake bloom; Princess Elizabeth, rose-pink; Model, the most perfectly formed of all Border Pinks; Fire King, vivid scarlet; Negress, a large, deep crimson flower; Mrs. Herbert, a soft pink with a crimson zone, and Bridesmaid, a lovely soft salmon-pink. Messrs. ISAAC HOUSE AND SON showed a large quantity of a free-flowering Border Pink named White Ladies.

### Ferns.

There was only one collection of stove and greenhouse Ferns and this was of comparatively small plants arranged by Messrs. ELLISONS. In the centre there was a goodly specimen of *Platycerium Veitchii*. The larger Ferns included *Polypodium Mandaianum*, *Blechnum granodense* and *Davallia ornata*, while towards the front there were dainty little plants of *Pteris tricolor*, *Gymnogramme Alstonii*, *Pellaea ternifolia*, and *Doodia superba multifida*.

A large collection of his well-known hardy Ferns was displayed with German Irises by Mr. AMOS PERRY. The Royal Fern, *Osmunda regalis*, was represented by several excellent specimens. Other sorts of great merit were *Osmunda regalis* Phillips, *Athyrium laciniatum*, *A. ramulosum*, *A. ff. cristatum* Elworthii, *A. ff. plumosum*, *Lastrea ramosa*, *Scolopendrium nobile* and *Struthiopteris germanica*.

### Irises.

The groups of Bearded Irises have become one of the features of Chelsea Show and they again formed the centre of attraction for the many lovers of these flowers which have been so infinitely improved in recent years.

Messrs. R. WALLACE AND Co., LTD., showed a group rich in newer varieties, *Souvenir de Madame Gaudichau*, *Franklin Beynon*, *Miranda*, with fine spikes of the better-known *Alcazar*, *Archeveque*, etc.

Messrs. BARR AND SONS staged a varied collection of such better standard varieties as *Sarpedon*, *Alcazar*, *Isoline*, *Princess of Wales*, and forms of *I. sibirica* with an edging of *Achillea*, *Thrift* and *Violas*.

Irises were also used with prominence by Messrs. WATERER, SON AND CRISP in their group of herbaceous plants, where we noted *Souvenir de Madame Gaudichau*, *Shekinah*, *Magnifica*, *Lord of June*, etc., and by Mr. AMOS PERRY in association with his hardy Ferns. Here was included a very delightful little batch of hybrids between *I. bracteata*, *I. Watsoniana* and *I. tenax*. Striking bearded varieties of special value were *Mary Gibson*, light rose-bronze; *Mrs. Marion Cran*, purplish pink; *Mrs. H. F. Bowles*, bronze and maroon; *Duke of York*, pale

mauve blue; *Mestor*, deepest violet; the well-known *Magnifica* and *White Queen*.

A very welcome exhibit came from Mrs. W. R. DYKES, who showed a batch of the finer seedlings raised by the late Mr. Dykes. Among the self-coloured blues were *Goldcrest*, *Venetia*, *Sapphire*, *Aphrodite*, tall purplish rose; *Moonlight*, slaty white; *Amber*, a good yellow; and *Lustre*, a red purple self were also fine. The pure yellow *Moraea spathacea*, finely grown, added a vivid patch of pure yellow.

The ORPINGTON NURSERIES staged a large semi-circular bank of good forms. Iris colours are not easily judged under canvas, but the more striking varieties included the immense purple *Mauna Loa*, the reddish plum shades of *Evadne* and *Seminole*, *Argynnis*, bronze and brown, *Aphrodite*, self purplish rose, *Athene* and *Queen Mary*, white, with the beautiful self blue of *Wedgwood*.

The finest collection of Irises in the Show both from the point of view of quality and variety was that arranged by Messrs. GEO. BUNYARD AND Co. The lifted plants showed extraordinarily clean, vigorous growth and while *Lilies* and *Eulalia* were used to lighten the decorative arrangement there could be no finer foil to the flowers than the Iris foliage itself. The advances made in recent years were admirably shown by the best varieties from American and French as well as British raisers. Some of the noblest flowers showed the Dominion parentage. Among the deep purples *Duke of Bedford*, *Pioneer*, *Centurion* and *Tenebrae* were outstanding. *Ambassadeur*, *Souvenir de Madame Gaudichau*, *Lent A. Williamson*, *Billia*, *Shekinah*, *Mrs. Marion Cran* and *Harmony* were a few other varieties shown in fine condition.

### Sweet Peas.

Messrs. DOBBIE AND Co. showed a unique collection of sixty varieties, exhibiting magnificent quality and cultivation. Perhaps the most striking sort was *Prince of Orange*, a much frilled flower of deep orange, several shades richer than *Royal Sovereign*; *Camellia*, a new frilled, white variety; *Hero*, salmon-cerise, and *Flamingo*, orange-cerise, were also very fine. Outstanding for its vigorous two feet stems, was *Pinkie*, bright vivid pink. *Daffodil*, *Blue Bird*, *Gleneagles*, *Mary Rose*, *Hebe*, and *Picture*, were other striking vases.

Messrs. ALEX. DICKSON AND SONS had a novel arrangement showing the flowers at the back of the group in large sprays against a cream trellis background, while in front were large baskets of one or two colours. Interesting contrasts were given by *Elegance* arranged with *Corona*, *King Mauve* with *Peggy*, *Crusader* with *Daffodil*, and *Lucifer* with *Edna May*. *Magnet* and *Flambeau* were noteworthy fine, and there was a new scarlet seedling of which more will be seen later.

Messrs. R. BOLTON AND SON staged a striking group of almost solid colour from the profusion of bloom in close-packed vases. The outstanding novelty for distribution in 1928 was the soft salmon, *Mrs. A. Searles*, finely shown. What *Joy* (cream), *Model* (white), *Jessie* (light pink), *Royal Sovereign* and *Colorado* (orange) with *Powerscourt* and *R. F. Felton* (still among the best of the mauves) were other outstanding vases. *Challenger*, a pink Fancy, is another of the firm's novelties likely to be popular.

Mr. J. STEVENSON, in a pretty arrangement which showed the varied colours to advantage, included *Glorious* (fine cerise), *Marjorie* (deep carmine), *Nina* (rosy-pink), *Austin Frederick* (improved (good mauve), and *Guinea Gold*, in a varied collection.

Messrs. JAMES CARTER AND Co. also showed a well-grown and varied collection of the best varieties. We noted *Model* (white), *Geisha* (cream), *Raynes Park* (mauve) *Venus* (cream pink), *Grenadier* (scarlet) and *Royal Sovereign* (orange).

### Rock Gardens on Tabling.

An excellent series of small rock gardens on tables made one of the most important features of No. 2 Tent. The popularity of grey mountain limestone, especially the weathered moss-covered, Westmoreland stone, was very marked, and no stone shows up the brilliant colours of rock plants to greater advan-

tage, but the use of other stones noted here and there is to be commended, so long as newly-quarried material, which spoilt one of the exhibits, is avoided.

Messrs. BOWELL AND SKERRATT, with a background of the newer Brooms *Dorothy Walpole*, *Donard Seedling* and *Cornish Cream*, included among their rarer plants *Viola pedata* and *V. elatior*, *Erigeron flagellaris* and *E. leiomerus*, *Astragalus massiliensis*, *Scorzonera rosea*, *Lewisia* and hardy Orchids.

Mr. P. GARDNER included the seldom seen white form of *Primula farinosa*, *Dianthus glacialis*, *Aquilegia calcarata* and other good things, in a setting of Yorkshire limestone.

Messrs. SHEPPARDS had a small collection in which we noted the bright *Armeria Merlin*, with good plants of *Oxalis enneaphylla*.

Messrs. BACKHOUSE, LTD., using the Westmoreland stone, had good plants of *Gentiana acaulis* and *Ramondia*. The tiny *Rosa Roulettii*, flowering at three inches, and *R. pumila* at six inches, both of which bloom continuously, were prettily shown, and are obviously becoming favourites. The minor form of *Arenaria tetraquetra* with a number of *Oxalis* species, were also good.

Few of the small rock gardens had a more varied collection than that shown by Mr. GAVIN JONES. *Dianthus callizonus* was a gorgeous plant, and with many good plants of commoner things, *Myosotis spathulata*, *Erodium chamaedryoides rosea*, *Erinus hispanicus*, *Oxalis chrysanthus*, *Raoulia australis minutifolia*, *Trifolium uniflorum*, and the scarlet-flowered *Saxifraga aizoides incarnata*, were items not noted elsewhere in the Show.

Dr. MACWATT's exhibit from Morelands, Duns, Scotland, gained distinction from its little-known species of *Primula*. Colour mass was given by Auriculas (of which a particularly good blue border variety was included in quantity), *P. Veitchii*, *P. sikkimensis* and other well-known plants, but the lover of rare plants found here *P. scotica*, *P. Ellisiae*, *P. macrodonta apicola*, (Fig. 181) *P. Florindae* and a very charming *P. marginata* hybrid.

Messrs. TUCKER'S, LTD., covered a sloping rocky bank with good things. The broad-leaved form of *Saxifraga Cotyledon* was strikingly good, and its profusion in flower sprays showed its value as a decorative greenhouse plant. *Smilacina racemosa* in excellent condition, seldom met with, was shown well. *Campanula abietina*, *C. thyrsoidea*, *Wahlenbergia Pumilio* and alpine *Columbines* were also notably good.

Messrs. OLIVER AND HUNTER, while not neglecting things the more common at once attracted attention by their unique collection of some of the aristocrats of *Primula* species, grown in a robust way that may well be the envy of less favourably placed gardens. In *P. Littoniana*, *P. Prionotis*, *P. Florindae*, *P. flexilipes*, *P. microdonta*, *P. seclusa*, *P. luteola*, *P. pseudo-sikkimensis*—we touch the fringe only of names of interest.

An interesting collection of out of the way plants was brought up by Mr. W. H. WALTERS, *Colesbourne Gardens*, Cheltenham. *Habranthus pratensis* is flowered well there. *Elwes'* bronze-leaved form of *Rodgersia* was very good. *Rheum Alexandrae*, *Paeonia Cambessedesii*, the double form of *Meconopsis quintuplinervis* and a number of rare terrestrial Orchids are a few among many items of choice character included.

Messrs. WATERER, SONS AND CRISP, with other good things, included *Roscoea*, *Viola pedata*, and *V. rupestris*, *Mimulus Rargrave* *Fireflame*, the *Wargrave Trollius pumilis*, *Globularia incanescens*, and fine plants of the little-known *Pentstemon confertus coeruleus*. The restful effect gained by restraint in the use of plants gave special value to the exhibit from Messrs. CLARENCE ELLIOTT, LTD., Stevenage, and the many good plants included showed up the better for their careful association. *Wahlenbergia Pumilio* and *Oxalis magellanica* were well shown.

Messrs. W. H. ROGERS AND SON, LTD., made good use of the *Leptospermums*, with *Embothrium coccineum* as a striking centrepiece. *Campanula muralis major*, *Polemonium carneum*, *Saxifraga catherhamensis*, and some good *Dianthus* species were noted.

A charming rock garden effect was given by a brown, moss-covered, local stone, brought up by Messrs. W. E. TH. INGWERSEN, LTD., Birch Farm, Sharpthorne, East Grinstead, which showed the good plants used to the best advantage. Plants not noted elsewhere included *Viola Thuringiaca*, *V. lutea*, *Epilobium chlorifolium*, *Alochemilla alpina* and *Mimulus Langsdorffii*, but clumps of commoner plants gave the chief colour effect.

Mr. FRED G. WOOD, with excellent plants of such useful subjects as *Azalea rosaeiflora*, *Verberna chamaedrifolia* and a variety of *Primulas* and *Saxifrages* had indeed more material in shrubs and rock plants than they were able to place wisely, and the sense of overcrowding weakened the general effect of the plants.

The WANSFORD NURSERIES exhibited miscellaneous rock plants, among which we noted *Saxifraga Canis-dalmatica* and *Wahlenbergia serpyllifolia*.

Messrs. J. CHEAL AND SONS backed a table of rock plants with herbaceous *Lupins*. May Queen, deepest purple; Delight, richest pink; and Terracotta, were outstanding among them.

Mr. G. REUTHE, with a background of *Conifers* and shrubs (we noted especially the beautiful little dwarf *Pinus beuvronensis*), showed a number of good plants from his unique collection of rock plants, terrestrial *Orchids* in variety, species of *Dianthus*, *Lewisia*, and other *cepinas*.

Another exhibit of rare plants came from the PRIMLEY BOTANIC GARDEN. *Berberis Thunbergii atropurpureum* is a notable piece of colour; *Dianthus Atkinsoni*, now very rare, was finely shown; *Leucadendron argenteum* and the Primley Blue *Malva* were also good, but particularly interesting were the seedlings derived from *Ceanothus papillosus* varying in colour from a grey tone of blue to a rich blue and differing immensely in leaf character.

In the very varied collection of rock plants from Messrs. ROGERS, Pickering, we noted good plants of *Cytisus Beanii*, *Ourisia coccinea*, *Gentiana acaulis*, *Dianthus Freynii* and *Campanula Stevensii nana*.

CENTRAL GARDEN SUPPLIES produced a good effect in their rock garden by the use of Brooms and other shrubs as a background and foil for the choicer rock plants in front. *Ranunculus parnassifolius* and *Achillea King Edward* took the eye.

From Mr. MAURICE PRICHARD came the group that more than any other in these limited spaces showed the great wealth of varied colour that rock plants provide at this time of year. Every plant seemed well-flowered, and among commoner things we noted *Gentiana verna*, *Ledum Lyonii*, *Helianthemum lunulatum*, *Silene Hookeri*, *Aster alpinus albus* and *Anthyllis montana*.

The interesting plants arranged by Mr. H. HEMSLEY included *Dianthus Prince of Wales*, *Heeria elegans*, *Roscoea Humeana*, *Dianthus versicolor* (changing from white to pink), *Alyssum idaeum*, *Mitrraria coccinea* and *Mesembryanthemums* in variety.

Messrs. CHAPLIN BROS. showed a little collection of *Violas* in which the Chestnut-coloured *Arkwright Ruby* and the very deep purple *Purple Bedder*, a sport from Lloyd George, were the outstanding plants.

The new white *Pink*, *White Ladies*, was admirably shown by Messrs. ISAAC HOUSE AND SON. Its purity of colour, length of stem, good shape and profusion, are bound to make it a popular plant. *Pentstemon heterophyllus* and the very good blue *Viola Ann Hathaway* increased the colour value of the *Pinks*.

Mr. H. LANGRIDGE, Westerham, Kent, showed a small group of rock plants using a freshly quarried brown Kentish stone as a setting, of which the newness rather spoiled the effect of the planting.

Messrs. MAXWELL AND BEALE had one of the most distinctive arrangements of rock plants. The *Heathers* in which they specialise were represented by the golden leaved and copper *Ling*.

Messrs. WM. WOOD AND SON, LTD., arranged an effective exhibit, with well-flowered plants in a grey limestone formation. The less common plants noted included *Pentstemon Bridgesii*, *Campanula Lauri*, *Primula Smithiana*, and the Beechwood, deep carmine variety of *P. farinosa*.

Mr. J. ROBINSON showed a miniature rock garden arranged prettily for colour effect with standard varieties of *Alpines*, *Saxifraga pyramidalis* and *Sisyrinchium anceps*.

Messrs. HODSON, LTD., showed rock *Conifers* and alpine plants.

Mr. SCAPLEHORN had an exhibit rich in little-known plants, with a good collection of encrusted *Saxifrages* in flower. We noted *Lilium parvum*, some fine *Haberleas* and *Ramondias*, *Shortia galacifolia* and *Primulas Littoniana*, and the Bartley strain of *P. pulverulenta*.

The Misses HOPKINS staged a pleasant little group rich in colour provided by such favourites as *Daisy Dresden China*, *Phlox Vivid* and *Armeria Lauchiana*.

Messrs. JEANS AND TROWBRIDGE had a rich collection of rock plants, among the varieties of which we noted some nice plants of *Cyathodes Fraseri* and *Leptospermum hybrids*.

The HORTICULTURAL COLLEGE, Aldersey Hall, near Chester, sent a collection of well-grown plants of the *Primulas sikkimensis*, *P. luteola*, *Red Hugh* and *Lissadell hybrids*.

congenial homes. Not the least pleasing of the many fine features was a colony of *Lithospermum Heavenly Blue*, and the uncommon *Convolvulus Cneorum*, which was finely in flower.

Mr. GARVIN JONES utilised large pieces of Cheddar stone in the construction of a rock garden that was effective and restrained in effect. The biggest stones were grouped on the highest portion at the back, and from this part flowed a stream that tumbled down rocks to a broad pool in the foreground, the extremity of which was planted with *Dodecatheon Meadia*, *Primula pulverulenta*, *P. sikkimensis*, *P. japonica* and *P. Eileen Aroon*.

Messrs. W. H. ROGERS AND SON contributed a small rock garden which showed to advantage against a dense background of shrubs. They arranged an irregular bed in the foreground and planted it very effectively with very low-growing plants, including a variety of dwarf *Conifers*, and this bed was separated by grass from a more pretentious rockery with very big stones. The best features were colonies of

FIG. 183.—CHELSEA SHOW: ROCK GARDEN EXHIBITED BY MR. G. G. WHITELEGG, AWARDED THE SHERWOOD CUP.

### Rock Gardens.

Mr. GEORGE G. WHITELEGG made a very natural-looking rockery that met with general approval for the skilful arrangement of the stones, the natural method of planting, and the judicious employment of water (Fig. 183) The general effect was a piece of alpine scenery with stream, waterfall and tarn, spangled with floral gems, amongst large portions of rock laid bare on the mountain side by the action of running water from melting snow, with debris trapped in the hollows in which alpine plants had found a suitable rooting-medium. In the background a colony of *Phlox Vivid* seemed to sweep as a cascade down the rocks, as a stream flows down to the lower levels. Above this were colonies of *Saxifraga catherhamensis* and *S. longifolia* overhanging from the crevices of the rocks above. On the other side of the stream was a drift of *Aquilegia pyrenaica*, a delightful touch of blue, and in the sheltered side of this rock was another pretty colony of *Ramondia pyrenaica*, gorgeous plants growing in the shade of the rocks. Where the stream passed was a little outcrop planted with the blue *Campanula muralis major*, and here the water tumbled in the cairn. To the left was another bold outcrop, and next a path leading to the higher parts with masses of stones outcropping the hillside in which *Saxifraga aizoon lutea*, *Aethionema Warley Rose*, *Viola grandeur* and *V. lutea* found

*Primula pulverulenta*, *P. Lissadell hybrid* and *Tiarella unifoliata*.

Mr. CLARENCE ELLIOTT arranged an outcrop of boulders of beautiful pieces of grey limestone in the foreground of his rockery exhibit, with a small patch of rocks behind, suggesting the continuity of the scheme in the background, the whole planted with the eye of a keen lover and acquaintance of these floral gems in their natural habitat. It was, indeed, the planting that inspired most, and no more natural effect could be produced than the sheet of *Sedum spathulifolium purpureum* that seemed to slither down the side into the valley below. The summit of the rockery was overhung with the spikes of *Saxifraga aizoon lutea* and *S. Esther*, and a moss-covered path led to other plantings of *Aquilegia glandulosa*, a speciality of the firm; *Campanula Stevenii*, *Armeria Vindictive*, which blended beautifully with the blue *Viola Blue Stone*; *Meconopsis Baileyi*, and *Primula sikkimensis*. Not the least pleasing feature, was a colony of *Juniperus hibernica compressa*, the plants ranging from specimens two feet tall and twenty-five years old, to pygmies two inches or so high, and some three or four years old.

Messrs. HODSONS, LTD., made a rockery with Westmoreland limestone, which was beautifully striated. The back of the rockery was arranged in a series of terraces, somewhat formal, perhaps,

but, on the whole, very effective. From the higher parts, a stream flowed to a pool in the foreground, the bank of the stream lined with stratified rocks, the tops of which were water-worn, and in the opinion of some, rather unnatural in such positions. The general effect was good and the planting effective, the most notable subjects being a colony of *Azalea amoena*, *Daphne Cneorum*, *Armeria Vindictive*, the yellow *Genista hispanica*, *Primula Red Hugh*, the blue *Gentiana acaulis*, *Viola grandeur* and *Phlox Vivid*.

Mr. HERBERT BROOK is to be complimented on his very natural rock garden, in which water was skilfully utilised; indeed, the water stream and water fall were admirably conceived and executed. By the banks of the stream colonies of such dwarf plants as *Myosotis rupicola*, *Saxifraga Wallichii*, *Gentiana verna*, *G. angulosa*, *G. acaulis*, *Dianthus arvensis*, *Aethionema Warley Rose*, *Saxifraga Cochlearia minor* and *Saponaria ocyroides splendens* found a suitable home, and there were other delightful subjects in variety associated with dwarf shrubs and Conifers.

Messrs. W. CUTBUSH AND SON arranged a

grace that only Lily stems and foliage possess and fine cultivation was shown in controlling the flowering period of such a rich range of species, each shown in quantity. *Lilium japonicum*, *L. regale*, *L. Hansonii*, *L. testaceum*, many forms of *L. umbellatum* and *L. Thunbergianum* were outstandingly fine and the garden picture provided by a grassy glade furnished on either side with Lilies, Irises, Rhododendrons and Azaleas was very much admired.

Messrs. BAKERS, LTD., arranged a pleasing group of Delphiniums and Astilbes in a rather uncommon colour scheme of blues and pinks. A pale form of Delphinium *Lascelles*, the double light mauve *D. David*, *Admiration* (mauve) and the well-known *King of Delphiniums* were included.

In Mr. J. C. ALLGROVE's group of herbaceous plants, subjects of special interest included *Rheum Alexandrae* and the *Eremuri Herriot* with its parents *E. himalaicus* and *E. robustus*.

Messrs. GEO. JACKMAN AND SON staged a clean, well-grown collection of good plants. *Lavatera Olbia* and Delphiniums were used as a background with Irises, Lupins, Pyrethrums and Columbines in front.

*Monarch of Wales*, tender rosy mauve of Mrs. Jessie Oldham, and rich purple of *Happy Thought*.

Mr. JOHN FORBES showed Stocks, Trollius, Violas, Delphiniums and other of his specialities.

Messrs. JARMAN AND Co. staged a charming range of *Viola cornuta* hybrids and Geraniums. In the Violas we ear-marked *Windley Gem*, very velvety violet, *Ruby Gem*, red-purple, *Goldcrest*, primrose yellow, and *Golden Spur*, rich yellow.

Messrs. MAURICE PRICHARD AND SONS staged a charming group including *Verbascum*, *Eremuri* and *Pyrethrums*, but specially rich in the range of colour tones given by herbaceous Lupins. *Brenda Prichard* (apricot), Mrs. G. Prichard (pale opal), and *Victoria* (deep purple) being specially fine.

Messrs. R. AND G. CUTHBERT staged a group of *Tritonia Prince of Orange*.

The improvements in herbaceous Lupins, emphasising especially the development of yellow shades and blends of yellow and pink were well shown by Mr. G. H. DALRYMPLE.

A group including some extra fine spikes of the *Lupinus Sulphur Gem* and *Ruby King* with *Paeonia anemonaeiflora rosea* and the silvery grey of *Artemisia arborea* was shown by the MAYTHAM GARDENS.

Mr. R. J. CASE staged Lupins, *Erigerons* and *Geums*, but had insufficient space to show them to advantage.

The CHALK HILLS NURSERIES, Mr. E. GALLAGHER, showed their giant Musks with Lupins, *Geums* and Irises.

*Eremuri*, Irises, Lupins and *Pyrethrums* were shown by Messrs. G. AND A. CLARK, LTD.

Messrs. RICH AND Co. staged Irises, *Pyrethrums*, Lupins and Poppies.

Mr. WM. YANDELL showed a very varied, well-grown collection of Violas in shallow trays.

*Ranunculus*, bulbous Iris, Lilies and *Gladioli* were staged by Mr. ALFRED DAWKINS.

Messrs. WATERER, SONS AND CRISP painted a charming picture using at the back the yellow *Lupin Sunshine* and *Verbascum vernale*, with the blues of Delphiniums and Lupins, while in the foreground were blended the varied pinks of Lupins and *Pyrethrums*. A plant to note is the semi-double orange *Geum* named *Fire Opal*, of the Mrs. Bradshaw class. *Lilium testaceum* was well shown with Irises, etc., making the group one of the most satisfying in the show from the artistic point of view.

The modern improvement in herbaceous Lupins was admirably shown in the group staged by Mr. G. R. DOWNER. No shades of colour are now better furnished than pinks, which range from the pale tint of *Lighthouse* to the deep crimson-pink of *Delight*, a variety found continuously in evidence throughout the show. Artist is a charming pale blue. Another series begins with the pale mauve of *Pilgrim*, and progresses to the deep purple of *Hermit*.

Mr. AMOS PERRY set up an exhibit of Oriental Poppies in which we noted the fringed scarlet *King George*, the unblotched immaculate *E. A. Bowles*, palest of pinks, and Perry's Blush.

Mrs. ALLEN showed a very striking piece of colour in *Gaillardia Tangerine*.

One of the unique exhibits of the show was the group of *Antirrhinums* staged by Messrs. DOBBIE AND Co. Admirably grown, the cut spikes showed how varied and decorative the Snapdragons now are. Scarlet Prince, Fiery Belt and coccinea were noted in the scarlet shades. Pinks included *Melrose*, *Fascination* and *Rose Queen*. Mauve was represented by *Mauve Queen*, *Nobile*, white with crimson blotch; *Prima donna*, pale apricot; *Moonlight*, orange and pink; *Gay Gordon*, scarlet and yellow, were also noted.

An attractive group was arranged by Messrs. B. LADHAMS who, over a groundwork of *Myosotis*, Violas, Daisies, Pinks, etc., had columns of taller subjects, such as *Thalictrum Purple Cloud* and *Pyrethrums*. The little-known but charming blue of *Rhazya orientalis* was seen here. *Veronica Teucrium Shirley Blue* was also good. *Sophora microphylla* and *Solanum crispum* were representative of the shrubs included.

Messrs. G. GIBSON AND Co. showed *Regal Lupins*, *Trollius* and similar herbaceous subjects, using *Alyssum*, *Saxifrage*, etc., as a foreground.

FIG. 184.—CHELSEA SHOW: RHODODENDRON GARDEN WITH VENETIAN TEMPLE EXHIBITED BY MESSRS. J. CARTER AND CO.

rock garden with fine pieces of sandstone, and planted it very effectively with a great wealth of rockery plants. The best feature was the waterfall, with Ferns growing in the crevices at the sides; the water tumbled down other rocks and led to a pool in the foreground. Amongst the many choice plants was a fine colony of *Ledum Lyonii*.

Messrs. PULHAM AND SON made a natural formation with weathered waterworn limestone, as found in Westmoreland, with a small stream fed from a dripping pool, the whole making a fitting finish to the range of rock gardens. The stone was of the finest quality and beautifully marked by years of running water. The disposition of the rocks allowed for spacious pockets, in which were growing colonies of many beautiful alpinines.

#### Hardy Flowers.

The outstanding exhibit of hardy plants was the unique collection of Lilies, Irises, *Eremuri*, and related subjects shown by Messrs. R. WALLACE AND Co., LTD. Nothing could have been more satisfying artistically than the beautiful arrangement of the Lilies. Japanese Maples, Bamboos and Grasses enhanced the

Messrs. KELWAY AND SON showed well the most varied collection of *Pyrethrums* with which their name has been so long associated as raisers. *Paeonies* were included with some rather weird nondescript colours (an intermixture of bronze and blue) in tree Lupins.

Mr. G. W. MILLER with other useful herbaceous flowers valued for cutting had a splendid stand of the grand pink *Pyrethrum Eileen May Robinson*.

The finest collection of Delphiniums was staged by Messrs. BLACKMORE AND LANGDON, who are among our foremost raisers. Prominent varieties in a large collection beautifully grown and tastefully shown were Mrs. Foster Cunliffe, an immense mauve flower, Mrs. Shirley, Millicent Blackmore, Sir Douglas Haig, Phyllis, pale mauve, and Edward Bromet, violet, white eye, which may be described as an improvement on the well known Rev. E. Lascelles.

Messrs. HEWITTS attracted much attention with a collection of Delphiniums representing the cream of modern varieties and exhibiting fine culture. A few varieties noted included the pretty blue of *Blue Bird*, the white of Mrs. Christie Miller, the Cambridge Blue of Mrs. Townley Parker, deep mauve and blue of

A group of mixed herbaceous and rock plants, including especially Delphiniums, Lupins, Irises, and Columbines, was shown by Messrs. WILSON AND AGAR.

Mr. H. CLARKE put up a collection of the best varieties of Violas in pans and baskets. An item of interest was a pot of *Mimulus moschatus* described as the true fragrant variety, and said to have been found in an old cottage garden in Somerset. Unfortunately, we failed to detect the fragrance. Perhaps it was the heat of the tent.

Messrs. E. J. REDGROVE AND SON showed Lupins, Geums and Paeonies, with an edging of the favourite Daisy Dresden China.

Mr. H. H. SCOTT exhibited Dahlia Coltness Gem.

The end included a rockery, and this was backed by Japanese Acers.

A very restful garden, overhung with trees, was arranged by Mr. WILKES, Horsecombe Quarries, Combe Down, Bath. It served to show the effectiveness of this Bath stone for garden seats, vases, sundials, etc., many fine examples of which were on view, and the garden afforded opportunity to show how such ornaments may be employed to good effect.

Mr. JAMES MACDONALD laid a perfect lawn with a formal water garden in the centre and utilised many handsome grasses in borders surrounding the same. A line of golden *Phleum pratense aurea lineatus* in front of a row of *Dactylus aurea elegantissima*, with taller grasses such as *Eulalia japonica variegata* and *Glyceria*

planted a Rhododendron garden, (Fig. 184) with an ornate Venetian Temple in the background approached by flights of circular stone steps and ornamented with Hydrangeas in leaden vases; the pillars of the temple were furnished with the beautiful-leaved *Vitis Henryi*. Two fan-shaped pools, one on either side, were fed by fountains that released the water at the feet of leaden figures, representing a boy with pipes and a girl with a lamb. The Rhododendron border on either side contained magnificent plants of a large number of varieties and the flowers were thrown into bold relief against the dense background of Conifers. Looking through the temple against a screen of Ferns overhung by a stately plant of *Viburnum Opulus*, finely in flower, the effect was enchanting.

FIG. 185.—CHELSEA SHOW: JAPANESE GARDEN EXHIBITED BY MESSRS. W. H. GAZE AND SONS.

#### Formal Gardens.

Messrs. PULHAM AND SON designed a very imposing garden in which a raised stone terrace with a very ornate pergola was the chief feature. The flagged pathway and terrace were fine examples of the paviour's art, and the stone pillars of the pergola were faultless in execution; it only needed the weathering influence of time to give the whole an established appearance. Much space was occupied by grass, in which were water-pools and beds of Roses, with old leaden figures raised on pedestals. The scheme was on a pretentious scale and the exhibit ranked as one of the best of its type.

Messrs. W. WOOD AND SON, LTD., erected a Tudor summer house in a garden of the same period, a very pleasing example of garden architecture with flagged paths, and central pool fed from dolphins, the water falling down steps to a pool grouped about with Primulas, *Campanula glomerata*, Aquilegias, Thrift and other old-time plants. The upper part of the garden was planted with Irises, and on banks held in position by dry walls were superb Lupins.

spectabilis at the back, was an example of perfect planting, and at the other end ornamental grasses were planted in the foreground of a shrub border gay with bright flowers.

Messrs. REAMSBOTTOM AND CO. made a small formal garden with a series of beds edged with Box and planted with St. Brigid Anemones in different colours, flowers which they specialise in and possess an excellent strain.

Messrs. MAURICE PRICHARD AND SONS planted a small garden with hardy border flowers of which Lupins were exceptionally good, and other features were choice Pyrethrums and Verbascum.

LONDON GARDENS planted the forecourt of a house with Verbenas in formal beds, the rest paved with stone. Under the windows of the house was a water pool for aquatics. The Verbenas were splendid plants carrying a wealth of beautiful flowers.

Messrs. HODSONS made a small formal garden and exhibited a model hard tennis court with a green surface.

Messrs. J. CARTER AND CO. designed and

and the cool, green sward in the foreground was restful and in perfect harmony with the scheme.

Messrs. R. WALLACE AND CO. exhibited a garden in which water was employed largely and to good effect, a series of broad pools terminating in a rock-face of water-worn limestone from which water dripped in a most natural manner, and in which Ferns found a congenial home. The banks of the pools on either side were planted with water-loving plants, such as *Iris sibirica*, *Primula japonica* and bog-loving Orchids. The far end terminated in a stone garden house on a terrace with steps leading to the pool. In turf around the water were numerous fine specimen Japanese Maples, and in the borders on the outskirts were floriferous Azaleas, Rhododendrons, Brooms, specimen Conifers and other shrubs.

Messrs. VERNON BROS. had a formal garden suitable for a London garden, in which a semi-circular pergola was the outstanding feature. The pergola was furnished with climbing Roses finely in flower, and in front of it was a circular pool with a bronze statue in the centre, a mag-

nificent piece of work. The centre of the garden included a broad, flagged pathway and borders on the outskirts were planted with a variety of showy flowers.

Messrs. R. NEAL AND SONS, LTD., made a feature of a sunk garden, in a pleasing design, the beds in this sunk garden being very attractively planted with dwarf Roses, Antirrhinums and Carnations. At the extreme end of the garden was a border of fine Rhododendrons which showed to great advantage against its background of tall Cupressus. On the outskirts were narrow borders with a row of white and blue Violas.

A Japanese garden designed by Messrs. W. H. GAZE AND SONS was one of the most novel and pleasing of the formal gardens (Fig. 185). Almost all the area was occupied by water which extended beneath a summer house built on piles, as is common in gardens in Japan. The summer house, which was finely designed, was approached by a rustic bridge leading past clumps of Iris sibirica of which there was a fine display in the centre of the water. Around the banks were other water-loving plants, and next to these a broad border of Flag Irises with Japanese Maples and Azaleas at intervals. This particular garden was a great attraction, both for its originality and fine execution.

Messrs. J. CHEAL AND SONS had a delightful garden in which Polyantha Roses contributed bright colour, and broad borders on either side were furnished with flowering shrubs and plants in variety, Rhododendrons, Wistarias, Brooms, Spiraeas and Campanula persicifolia being especially good. At the back of a stone terrace, with a circular pool in the foreground, was a bank bright with showy Azaleas.

A small round house thatched with Heather, after the fashion of the old Dutch houses found in some parts of Essex, was the special feature of the delightful garden arranged by Messrs. BAKERS, LTD. In front of the summer house was a pool, the banks of which were lined with water-loving plants, and at one part the pool was crossed by a rustic bridge in stone. Old Westmoreland stone was employed at suitable points of vantage, and a free use was made of flowering plants that love moist surroundings. Clumps of Daphne Cneorum, Incarvillea Delavayi, Primula japonica in variety and grand plants of Trollius were some of the outstanding features.

Messrs. A. CHARLTON AND SONS arranged a circular sunk garden with dry stone walls enclosing it, and approached by four flights of stone steps, and having two recesses with stone seats, the centre being set off by a leaden figure surmounted by a bird-bath. The terraces around were planted with a variety of shrubs and flowering plants associated with many choice ornamental leaved Asters. Rhododendrons and Kalmias were splendidly in flower, and gave big patches of colour. In the crevices of the paved floor and in the niches of the wall crevice plants in variety were skilfully disposed.

Messrs. R. AND G. CUTHBERT AND SON arranged an Azalea garden with three beds at one end massed with Hydrangeas. They built a retaining wall of old grey limestone and formed a terrace with a shrub border in the background, the chief subjects in flower being Azaleas and there was a bed of these floriferous plants at the end opposite the Hydrangeas. In the centre of the exhibit was a sunk garden with a pool and some grand plants of Azaleas bordering it. A row of Wistarias in bloom near to the edge of the terrace was a very pleasing feature.

Mr. ERNEST DIXON had a small sunk garden with a cane shelter at one end and he arranged a rockery in a very natural manner, the stone being exceptionally fine, old, grey, weathered limestone.

Messrs. SUTTON AND SONS showed model hard and grass tennis courts and a miniature bowling green, all to scale, and with red rubble paths between, the whole enclosed by a dwarf Yew hedge.

### Tulips.

Tulips were in general past their best before the date of the show, and the heat during the show unfavourably affected some of the exhibits. This brought into only greater prominence the richness in quality and variety of the exhibit staged by Messrs. BARR AND SONS

in which, at the opening of the show, a weak bloom was hardly to be found. Prince of Orange formed a noble centrepiece. Bouton d'Or contrasted with La Tulipe Noire—a grand vase of Zomerschoon—Bleu Aimable, Ronald Gunn, Pensu Amere, Corydon, Princess Juliana, Farncombe Sanders, Goldfinder were a few other vases singled out for their beauty. The attractiveness of the vivid colouring of the Tulips was enhanced by the use of Japanese Maples and Asparagus Sprengeri.

Another rich group of May-flowering Tulips was staged in fine condition by Messrs. DOBBIE AND CO. While a catalogue is needed to do the collection justice, a few varieties may be mentioned, e.g., the white Carrara and Zwanenburg (the latter rather spoiled by its black pollen) the deep scarlet of City of Haarlem, the glowing carmine of Petrus Hondius, the orange of Orange King and La Merveille, and purple of Frans Hals. Wm. Pitt, Harry Veitch, Charm, Salmon King and Clara Butt were also included in a fine condition.

The BRONWYLFE FRUIT FARM showed a varied collection of Cottage and Darwin varieties, but the flowers were already past their best.

Mr. HERBERT G. LONGFORD also showed good Tulips, arranging them as tall columns over a field of blue Spanish Irises.

Zwanenburg, the new white, Samson, Vesta and Mrs. Kerrell, were included in some good flowers shown by Messrs. DANIELS BROS.

Messrs. R. H. BATH, LTD., put up an interesting collection. The glowing rose of Triton and the rich colouring of the breeders Louis XIV and Turenne were prominent, with a large batch of that richest of yellows, W. T. Ware. Pyrethrums, Trollius, Lupins and some early Gladioli of the primulinus type were included in this group.

Mr. G. W. MILLER included a few of the lesser known varieties in his collection of herbaceous pink Cottage Tulips: Amber, very late and Professor Westwick, a striking coloured, Cottage variety, were noted, with Walter T. Ware and The Pearl.

### Fruit and Vegetable Committee.

Mr. A. H. Pearson (in the Chair), Mr. Jos. Cheal, Mr. W. Poupart, Mr. T. Pateman, Mr. W. Giles, Mr. P. C. M. Veitch, Mr. F. Jordan, Mr. W. H. Divers, Mr. E. Harriss, Mr. E. Neal, Mr. H. V. Taylor, Mr. J. Basham, Mr. A. Bullock, Mr. G. F. Tinley, Mr. A. E. Newby, Mr. J. Harrison, Mr. A. Metcalfe, Mr. A. Poupart and Mr. A. N. Rawes (Secretary).

### VEGETABLES.

The Hon. VICARY GIBBS (gr. Mr. Edwin Beckett), contributed one of the superb collections of vegetables for which he has gained fame at all the important exhibitions. On this occasion Mr. Beckett adopted a different style of staging, and introduced another novelty in including beds with plants as growing. The display was arranged on the ground, and occupied a space of twenty-four feet by twenty feet. Each corner was occupied by a stand of circular outline towards the centre, and in the middle was a tall trellised stand crowned with pot plants of Capsicums of red and yellow varieties. This central stand was in two portions, with Aubergines fruiting in pots plunged in soil, and with a carpet of sweet Potatoes. On the stand were shelves to accommodate such subjects as Marrows, Cauliflowers, Peas, Beans and Beets. The corner stands were grouped with a great variety of vegetables of the highest quality and most skilfully blended to produce a pleasing colour effect. With regard to quality, the exhibit reached the highest stage of the grower's art, for not a single dish left anything to be desired or admitted of adverse criticism.

Messrs. SUTTON AND SONS adopted a novel style of displaying vegetables, and made an exhibit equal in effectiveness to a group of fine plants or flowers. It was a bold attempt and entirely successful. The major portion of the exhibit was arranged on a low, semi-circular dais, carpeted with fine turf. The background rose to the eave of the tent and was covered with black velvet. One of the principal features were columns surmounted with baskets con-

taining different vegetables, and those at the back were connected at the top with festoons of Smilax. The great success resulted largely from the skilful blending of the differently coloured subjects, in red, scarlet, yellow, green, white, purple, and many other colours. The collection embraced 150 dishes of distinct kinds and varieties, representing practically all the kitchen garden affords throughout the whole year. Of the sorts we have only room to refer to the splendid Cauliflowers, Peas, Cucumbers, Carrots, Tomatos, Beans and Potatos, representative of the choice strains offered by this firm.

Messrs. J. CARTER AND CO. exhibited vegetables of fine quality, on staging with twenty-four feet run of frontage. The group was interesting in that growing plants were arranged with the picked produce. Thus Broad Beans were shown carrying the pods, with cones of pods in association. Cucumbers, Peas, Florence Fennel, Indian Corn, Aubergines and others were similarly exhibited, and the growing plants were of great interest, as showing the cropping qualities of the various varieties. Cauliflowers All-the-Year-Round, Forerunner and First Crop were especially fine, and there were excellent Marrows, Tomatos, Peas, Lettuces, Artichokes, Asparagus and various other kinds.

### FRUIT.

Messrs. T. RIVERS AND SON, LTD., showed pot fruit trees, filling an area of 400 square feet. This fine exhibit included splendid Orange trees bearing large crops of fruits and with exceptionally healthy growth. Peaches and Nectarines were represented by many well-fruited trees of such varieties as Peregrine, Kestrel, Duchess of Cornwall (Peaches); Early Rivers, Cardinal and John Rivers (Nectarines), the last a comparatively new sort which ripens its fruits earlier than any other variety in a cold house or out-of-doors. Cherry trees, with fine crops of fruits, and Figs contributed further variety to this excellent exhibit.

Messrs. LAXTON BROS. exhibited Strawberries as usual, and the high quality of the plants and berries surprised everyone, considering how unfavourable the season has been; indeed, we think this was the finest exhibit of Strawberries they have shown at Chelsea. They had pot plants all carrying heavy crops of ripe fruits, and many baskets of gathered berries. The Duke variety was given the central position, this being, in the firm's opinion, the finest new maincrop variety since Royal Sovereign was raised, and likely to supersede the latter in the many districts where it seems to have deteriorated. Amongst the novelties was Duchess of York, a maincrop variety of fine flavour, with strong constitution and bright scarlet colour. Other good sorts were Robust, maincrop; Maréchal Foch, mid-season; Majestic, mid-season; and Lord Beatty, a big, wedge-shaped variety.

Major the Hon. Sir JOHN WARD showed a general collection of hot-house fruits, of which Melons predominated, there being fifty excellent fruits of such sorts as Hero of Lockinge, Ring-leader, King George, Chilton Eclipse and Universal. Stands of Grapes of Black Hamburgh and Foster's Seedling were arranged toward the back, amongst the Melons, and in the foreground were choice Peaches, Nectarines, Strawberries and Figs. The quality of all the fruits was good and reflected the highest credit on the skill of the gardener, Mr. C. Beckett.

Messrs. GEORGE BUNYARD AND CO., LTD., exhibited a new Cherry named Chinese Early. It was discovered by the late F. N. Meyer in 1907 near Tangsi, Chekiang Province, where it is largely grown in orchards. Mr. Meyer sent grafts to Messrs. Bunyard from which they raised the first trees in this country. It was at one time considered to be Prunus Pseudocerasus; botanists now consider it to be distinct from this, but the exact name has not yet been determined. Owing to the flowers being produced very early in the year, it is not safe to plant this Cherry out-of-doors, though it is quite hardy in other respects. Under glass or on a wall it produces fruits abundantly, which ripen early in May, without any fire-heat. Mr. E. A. Bunyard informs us that the tree

is quite self-fertile, and fruits quite well where one tree only is grown. The flavour is very sweet and juicy, and the bright pink colour most attractive; but the fruits are of small size.

### Awards by the Council.

#### CHALLENGE CUPS.

*Sherwood Memorial Cup.*—For the most meritorious group in the Show; to Mr. G. G. WHITELEGG.

*The Cain Cup.*—For the best exhibit by an amateur; to Sir JEREMIAH COLMAN, Bart. (gr. Mr. J. COLLIER), Reigate, for Orchids.

*The Orchid Challenge Cup.*—For the best group of Orchids arranged by an amateur on a space not exceeding 60 sq. feet. This competition is open only to those amateurs who employ not more than three assistants in the Orchid houses, including the head gardener; to J. J. JOICEY, Esq.

#### SILVER CUPS.

To Messrs. BUNYARD AND CO., for Irises; to Messrs. WATERER, SONS AND CRISP, for Herbaceous Plants; to Messrs. H. G. ALEXANDER, LTD., for Orchids; to Messrs. J. AND A. MACBEAN, for Orchids; to Messrs. BARR AND SONS, for Tulips; to Messrs. JAMES CARTER AND CO., for Vegetables; to Messrs. T. RIVERS AND SON, for fruit trees in pots; to The Hon. Sir JOHN WARD, for fruit; to Messrs. CHAPLIN BROS. for Roses; to Messrs. R. AND G. CUTHBERT, for Azaleas; to Messrs. J. WATERER, SONS AND CRISP, for Rhododendrons; to Messrs. BLACKMORE AND LANGDON, for Begonias; to Mr. H. J. JONES, for Hydrangeas; to Mr. FRANK LADDS, for Hydrangeas; to Messrs. L. R. RUSSELL, LTD., for Tree Ferns, Stove and Greenhouse Plants; to Messrs. HILLIER AND SONS, for Flowering Trees and Shrubs; to Messrs. G. JACKMAN AND SON, for Clematis; to Mr. R. C. NOTCUTT, for Hardy Shrubs; to Messrs. JAMES CARTER AND CO., for a garden; to Messrs. R. WALLACE AND CO., for a garden; to Mr. HERBERT BROOK, for a Rock Garden; to Mr. GAVIN JONES, for a Rock Garden.

#### MEDALS.

*Gold Medal.*—To Messrs. R. BOLTON AND SON, for Sweet Peas; to Messrs. DOBBIE AND CO., for Sweet Peas; to Messrs. CHARLESWORTH AND CO., for Orchids; to Sir JEREMIAH COLMAN, Bart., for Orchids; to the Hon. VICARY GIBBS, for Vegetables; to Messrs. SUTTON AND SONS, for Vegetables; to Messrs. R. WALLACE AND CO., for a mixed group of Lilies, Irises and other plants; to Messrs. JAMES CARTER AND CO., for Greenhouse plants; to Messrs. SUTTON AND SONS, for Salpiglossis; to Messrs. C. ENGELMANN, LTD., for Carnations; to Messrs. ALLWOOD BROS., for Carnations and Pinks; to Messrs. BAKERS, LTD., for a Garden; to Mr. G. G. WHITELEGG, for a Rock Garden.

*Silver-Gilt Hogg Medal.*—To Messrs. LAXTON BROS., for Strawberries.

*Silver-Gilt Flora Medal.*—To Messrs. COWAN AND CO., for Orchids; to Messrs. STUART LOW AND CO., for Orchids; to Messrs. SANDERS, for Orchids; to Messrs. FRANK CANT AND CO., for Roses; to Mr. GEORGE PRINCE, for Roses; to THE YOKOHAMA NURSERY CO., for Japanese trees, miniature gardens and Azaleas; to Mr. AMOS PERRY, for hardy Ferns, etc.; to Lady ABERCONWAY and the Hon. H. D. McLAREN, for Hippeastrums and Streptocarpus; to Messrs. STUART LOW AND CO., for Carnations; to Messrs. W. FROMOW AND SONS, for Japanese Maples; to Messrs. HILLIER AND SONS, for Conifers; to Mr. G. REUTHE, for shrubs; to Messrs. H. CHARLTON AND SONS, for shrubs; to Messrs. GAZE AND SONS, for a garden; to Messrs. JAMES McDONALD, for a grass garden; to Messrs. R. NEAL AND SONS, for a garden; to Messrs. W. WOOD AND SONS, for a garden; to Messrs. M. PRICHARD AND SONS, for rock garden plants; to Mr. CLARENCE ELLIOTT, for a rock garden; to Messrs. HODSONS, LTD., for

a rock garden; to Messrs. DOBBIE AND CO., for Antirrhinums.

*Silver Flora Medal.*—To Messrs. A. DICKSON AND SONS, for Sweet Peas; to Messrs. J. CYPHER AND SONS, for Orchids; to Mr. J. J. JOICEY, for Orchids; to Mr. J. H. PEMBERTON, for Roses; to the Exors. of the late Mr. W. C. SLOCOCK, for Rhododendrons; to Messrs. TOOGOOD AND SONS, for a group; to Messrs. STUART LOW AND CO., for a group of Australian and other greenhouse plants; to Baron B. SCHRÖDER, for Hydrangeas; to Mr. S. SMITH, for Cacti and Succulents; to Mr. C. H. HERBERT, for Pinks; to Messrs. K. LUXFORD AND CO., for Carnations; to Messrs. FLETCHER BROS., for Conifers and flowering shrubs; to Mr. H. HEMSLEY, for shrubs; to THE HOLLAMBY'S NURSERIES, for trees and shrubs; to Messrs. R. GILL AND SONS, for shrubs; to Messrs. J. WATERER, SONS AND CRISP, for Conifers and shrubs; to Messrs. VERNON BROS., for a garden; to Messrs. W. H. ROGERS AND SON, for alpine plants and dwarf shrubs; to Mr. E. SCAPLEHORN, for rock garden plants; to Mr. W. WELLS, Junr., for rock garden plants; to Messrs. TUCKERS (Oxford), LTD., for rock garden plants; to Messrs. W. H. ROGERS AND SON, for a rock garden; to Messrs. CARTER, PAGE AND CO., for Dahlias; to Mr. G. R. DOWNER, for Lupins; to Messrs. G. JACKMAN AND SON, for Herbaceous plants; to Messrs. M. PRICHARD AND SONS, for Herbaceous plants; to Messrs. M. PRICHARD AND SONS, for Lupins; to Mr. W. YANDELL, for Violas.

*Silver Grenfell Medal.*—To Mr. PERCY S. CANE, for plans, paintings and photographs of Gardens.

*Silver-Gilt Banksian Medal.*—To Mrs. W. R. DYKES, for Irises; to THE ORPINGTON NURSERIES CO., for Irises; to Messrs. BLACK AND FLORY, for Orchids; to Messrs. MANSELL AND HATCHER, for Orchids; to the Exors. of the late Mr. H. T. PITT, for Orchids; to Messrs. B. R. CANT AND SONS, for Roses; to Messrs. W. CUTBUSH AND SON, for Roses; to Messrs. W. EASLEA AND SONS, for Roses; to Mr. E. J. HICKS, for Roses; to Messrs. M. COSTER AND SONS, for Rhododendrons; to Messrs. J. PEED AND SON, for stove and greenhouse plants; to Mr. JAMES DOUGLAS, for border Carnations; to Messrs. J. CHEAL AND SONS, for shrubs; to Messrs. L. R. RUSSELL, for trees, shrubs and climbers; to Messrs. W. WATSON AND SONS, for Brooms; to Messrs. A. CHARLTON AND SONS, for a garden; to Messrs. J. CHEAL AND SONS, for a garden; to Messrs. PULHAM AND SONS, for a garden; to Mr. G. REUTHE, for Rock Garden plants; to Mr. C. ELLIOTT, for Alpines; to Messrs. W. CUTBUSH AND SON, for a rock garden; to Messrs. PULHAM AND SON, for a rock garden; to Messrs. BLACKMORE AND LANGDON, for Delphiniums; to Mr. G. H. DALRYMPLE, for Lupins and Primulas.

*Silver Banksian Medal.*—To Messrs. SUTTON BROS., for Orchids; to Messrs. E. WEBB AND SONS, for greenhouse plants; to Messrs. A. F. DUTTON, LTD., for Carnations; to Messrs. W. CUTBUSH AND SON, for clipped trees; to Mr. C. TURNER, for shrubs; to Mr. E. DIXON, for a garden; to THE LONDON GARDENS, for a garden; to Messrs. OLIVER AND HUNTER, for alpine; to Messrs. WATERER, SONS AND CRISP, LTD., for rock garden plants; to Messrs. BAKERS, LTD., for herbaceous plants; to Messrs. CHAPLIN BROS., LTD., for Violas; to the CHALK HILL NURSERIES, for herbaceous plants; to Messrs. HEWITT AND CO., LTD., for Delphiniums; to Messrs. KELWAY AND SON, for herbaceous plants; to Messrs. LADHAMS, LTD., for hardy plants.

*Flora Medal.*—To Mr. J. STEPHENSON, for Sweet Peas; to Mr. H. DIXON, for Orchids; to Messrs. DOBBIE AND CO., for Tulips; to Messrs. L. J. ENDTZ AND CO., for Azaleas and Hydrangeas; to Mr. W. H. WALTERS, for hardy plants; to Messrs. ELLISONS, for Ferns and Palms; to THE HORSECOMBE QUARRIES AND STONE WORKS, for a garden; to THE CENTRAL GARDEN SUPPLIES, for alpine plants; to Mr. F. G. WOOD, for alpine plants and dwarf shrubs; to Mr. H. CLARKE, for Violas; to the

MAYTHAM GARDENS, for herbaceous plants; to Messrs. A. J. ALLEN AND CO., for Gaillardias; to Messrs. RICH AND CO., for herbaceous plants; to Mr. AMOS PERRY, for Poppies.

*Banksian Medal.*—To Messrs. JAMES CARTER AND CO., for Sweet Peas; to Major H. F. FLETCHER, for Tulips; to Messrs. E. PAUL AND CO., for Roses; to Mr. T. LEWIS, for Rhododendrons; to Mr. J. C. ALLGROVE, for shrubs and herbaceous plants; to Messrs. DANIELS BROS., for a group of Roses, shrubs, etc.; to Mr. G. G. WHITELEGG, for shrubs and rock garden plants; to Messrs. LOWE AND GIBSON, for Irises, Lilies and border Carnations; Mrs. M. DENNY, for greenhouse plants; to Mrs. SHEPPEE, for Calceolarias; to Messrs. BAKERS, LTD., for alpine; to Mr. W. E. T. INGVERSON, for rock garden plants; to Messrs. MAXWELL AND BEALE, for alpine and Primulas; to Mr. T. GARDNER, for rock garden plants; to Messrs. W. WOOD AND SONS, for alpine plants; to Messrs. J. CHEAL AND SONS, for Dahlias; to Messrs. G. AND A. CLARK, for herbaceous plants; to Messrs. E. J. REDGROVE AND SONS, for herbaceous plants; to Mr. R. J. CASE, for hardy plants.

*Bronze Grenfell Medal.*—To Miss E. H. ADIE, for paintings; to Miss S. AVORY, for paintings; to Miss A. L. SPARK, for paintings; to Miss WINIFRED WALKER, for paintings.

\*\*\* Our remarks on the trees and shrubs educational exhibits and horticultural sundries, will be published in our next issue.

### ROYAL GARDENERS' ORPHAN FUND.

THE Annual Festival Dinner of this gardening charity was held at the Hotel Victoria, Northumberland Avenue, W.C.2., on Friday, May 20, under the presidency of Sir Henry Whitehead; the dinner was laid in the handsome Edward VII Room, and the tables were beautifully decorated by Mr. Harry Miles, who employed yellow Irises and Yellow Arum Lilies to complete a scheme both original and pleasing. Sir Henry Whitehead was accompanied by Lady Whitehead, and amongst others present we noticed Mr. and Mrs. E. Sherwood, Mr. and Mrs. W. Cuthbertson, Mr. and Mrs. D. Cuthbertson, Mr. and Mrs. D. Ingamells, Mr. P. R. Barr, Mr. G. H. Barr, Mr. G. Ingram, Mr. J. M. Bridgeford, Mr. H. J. Jones, Mr. and Mrs. J. E. Dixon, Mr. and Mrs. J. F. McLeod, Mr. and Mrs. A. H. Howard, Mr. A. Metcalfe, Mr. and Mrs. G. F. Tinley, Mr. W. Poupert, Mr. F. A. Secrett, Mr. A. Dawkins, Mr. and Mrs. C. H. Curtis, Mr. John Collingridge, Mr. and Mrs. Frank Ladds, Mr. R. B. Leech, Mr. D. Campbell, Mr. W. Howe and Mr. and Mrs. John Linford.

After the usual loyal toasts had been received, the principal toast of the evening—that of the Royal Gardeners' Orphan Fund—was proposed by the Chairman. He described gardening as one of the great arts, and said that nothing was more enjoyable than to go into one's garden and see the picture the gardener had produced. Sir Henry said that the gardener's art, however, differed from that of painters, who, during their life time, received enough for their work to enable them to look forward to their future without any feeling of uneasiness. The gardener's case was different, for his finished article does not demand that return in the way of value that the work of a great painter does, and he has no opportunity of laying much aside for the future, or for his children. Sir Henry said he had looked forward to occupying the chair that evening with a great deal of pleasure because his sympathies were very definitely in the direction of inclining to help those who cannot help themselves, and he felt sure everybody came there with the same feeling and desire.

Mr. E. Sherwood, in responding, said it was his privilege to do so once again as Treasurer of the Fund. With reference to Sir Henry's remarks on the painter, he ventured to say that it was the gardener who creates the glorious landscapes which make such indelible pictures on our minds, and which the painter only copies.

The Fund was doing good work in providing for the orphans of gardeners who in their lifetime have been unable to save. Mr. Sherwood said he had received many letters of gratitude from the mothers of those orphans for whom they were able to make provision. At the moment there were not so many orphans needing the benefits of the Fund, as in the past, but the time would come when there will be many more who will be in urgent need of the Fund. Mr. Sherwood was glad to say the Committee had been able, in a great measure, to replace the investments which had, perforce, to be sold during the years of the war, when it was next to impossible to obtain even the annual subscriptions. He was glad to notice that Mr. G. J. Nicholls, who occupied the chair at the last Festival Dinner, was with them again that evening. Some people seemed to think, said Mr. Sherwood, that the activities of the Fund are only centralised around the London metropolis, but this is not so, and he would like to see more secretaries in different parts of the country. Mr. Sherwood thanked all those who took an interest in the Fund, and hoped they would continue to do so.

Mr. G. J. Nicholls responded to the toast of the Visitors in place of Mr. Leonard Sutton, who was unable to attend, and Mr. T. R. Moncrieff, J.P., responded. At this stage of the proceedings, Mr. A. C. Bartlett, the Secretary, announced that the contributions amounted to over one thousand guineas. The principal sums on the Chairman's list included £100 contributed by himself; 130 fully paid ten per cent. shares in Messrs. G. Bowles, Nicholls and Co., from Mr. George J. Nicholls; fifty guineas from Messrs. Hurst and Son; £50 each from Sir James Hill and Sons, Messrs. Sutton and Sons, and Mr. John Harrison; twenty-five guineas from Messrs. Rothschild and Co.; twenty guineas from the Royal Horticultural Society; twelve guineas from Messrs. Corry and Co.; ten guineas from Messrs. Barr and Sons; eight guineas from Mr. David Swain; seven guineas from Messrs. Stewart and Co.; £240 collected by Mr. David Ingamells in Covent Garden Market, including fifteen guineas from Mr. F. A. Secrett; ten guineas each from Mr. Ingamells, Mr. H. Miles, Mr. J. L. Kinnell, Mr. J. Cull, Mr. M. Larsen and Mr. J. Collingridge; seven guineas from Mr. H. F. Hannibal; six guineas each from Mr. W. Turner, Mr. R. T. Bates and Mr. D. Tucker; five guineas each from Messrs. Lowe and Sawyer, Mr. A. Dimmock, Mr. W. T. Ware, Mr. J. Kirk, Mr. J. Linford, Mr. R. A. Witty, Mr. A. H. Stevens, Messrs. G. Prickett and Son, Mr. W. Maxwell, Mr. A. H. Maxwell, Mr. F. W. Ladds, Mr. H. Jolia, Mr. W. Stevens, Mr. G. Woodstock, Mr. T. J. Poupart, Mr. Edwards, Mr. F. Ridley, Mr. W. H. Robins, and £5 from Mr. A. Ward; seventy guineas from Mr. J. M. Bridgeford, including eighteen guineas from Messrs. Watkin and Simpson's Cricket and Tennis Clubs; five guineas each from Messrs. Watkin and Simpson; Mr. A. Watkins, Mr. J. M. Bridgeford, Mr. A. H. Howard and Messrs. J. Bodger and Sons; £25 from Mr. H. J. Jones, including five guineas each from Mr. F. P. Steward, Mr. D. B. Crane, and Mr. W. C. Sayers; £22 from Mr. J. F. McLeod and friends; £20 from Mr. J. E. Dixon and friends; £16 5s. 0d. from Mr. G. F. Tinley, including £8 18s. 6d. from *The Gardeners' Chronicle* Orphan Fund Box, and five guineas from the proprietors of *The Gardeners' Chronicle*, Ltd.; and fifteen guineas from Mr. A. Rayner. Five guineas each were contributed by Mrs. M. Campbell, Baron Bruno Schröder, Mr. W. E. Churcher, Mr. A. Dawkins, Mr. C. Heidsieck, Mr. A. R. Hollins, Mr. W. Marshall, Major E. G. Morro, Mr. W. C. Sayers, Mr. F. Turner, Mr. W. A. Vernon and Mr. R. B. Leech; £5 each from Mrs. E. Shepherd, Messrs. Charlesworth and Co., Lord Leverhulme, Sir Otto Beit, Mr. E. Tate and Mr. G. A. Witelaw.

The toast of "The Chairman" was proposed by Mr. William Cuthbertson. Sir Henry Whitehead in reply expressed his thanks and stated that it gave him great pleasure to preside at the Dinner of such a worthy institution. During the evening a programme of vocal and instrumental music was rendered under the direction of Mr. Ralph Norris.

## Obituary.

**William Knowles.**—We regret to record that Mr. William Knowles, gardener to the Earl of Dysart, Ham House, Petersham, Surrey, died on May 16 last, from bronchitis, after only two days' illness. Altogether, Mr. Knowles had served the Earl of Dysart for forty-three years. In 1884 he entered the Earl's Leicestershire gardens at Buckminster, and became head gardener in 1896, where he was especially successful in growing and exhibiting Muscat of Alexandria Grapes. In addition to care of the gardens, he was responsible for the woodlands and carried out extensive forestry plantings. In 1909 he took charge of the beautiful Ham House gardens at Petersham which he controlled with conspicuous success. During the war, large quantities of vegetables were grown, and the extensive lawns were devoted to hay production. So soon as the national need was over Mr. Knowles quickly restored the lawns and gardens to their previous beauty. Mr. Knowles leaves a widow and one son who, now a telegraphist at the Kingston Post Office, served in the Royal Engineers during the war and was engaged in laying telephone wires in the African jungle. His youngest son was killed at Jutland.

## TRADE NOTE.

### EXPORTING PLANTS TO NEW ZEALAND.

IN accordance with the promise made in our issue of May 15, Mr. A. Wilkinson, Hon. Secretary of the New Zealand (Nelson) Alpine and Rock Garden Society writes as follows: "Our Society has just received from England a collection of over four hundred plants for the Nelson rock garden. The consignment was packed on January 5, and did not arrive until March 22, so the plants were practically in the dark for eleven weeks. Despite this, however, they were in splendid condition, and in the whole shipment only three died. This excellent result must be a record, and proves clearly that with proper care in packing and shipping it is possible to send nearly any kind of plant to New Zealand. The most important points are proper packing and shipping, and it is just as well to give some particulars of the shipment under notice.

The plants came from three nurseries, i.e., Messrs. Bakers, Mr. Clarence Elliott and Mr. Amos Perry. Strange to say, all had adopted different methods of packing. Those from Messrs. Bakers were splendidly packed in layers, with plenty of Sphagnum-moss, each plant well tied and labelled. They consisted chiefly of Primulas, Funkias, Hemerocallis and Irises, and only one plant died on the journey. I believe many plants would not survive the use of wet moss, as they would rot away, especially Saxifrages, Dianthis and others.

In Mr. Clarence Elliott's consignment the plants were all packed in wet moss, but each one was sent in its flower pot. These came through well, but this method is a very expensive one, as the freightage charged is far greater, and there is a risk of the pots working loose, plants falling out, and labels getting mixed.

The third lot was from Mr. Amos Perry's plant farm, and if this is not an exception, his method of packing is the best, judging by results. Every plant was packed in thin wood shavings, wrapped round and round and well tied; the name label was wrapped in paper and fixed firmly to each plant. No Sphagnum moss was used, and the pots were just laid in a box without divisions; out of two hundred plants only one was dead on arrival. The plants were strong, with plenty of roots, and were, principally Aubrietias, Campanulas, Saxifrages, Sedums, etc. The cases had side ventilations which is very necessary.

Care in packing is useless, however, unless proper shipping conditions are adopted. The consignor should pack only just in time to catch the steamer decided upon, and the steamer should be one that will make its first call at the town nearest the destination. The shipment

in question was sent by ss. Port Caroline, which made its first call at Auckland, and it was delayed there a fortnight, whereas, if sent direct to Wellington, delivery would have been made three weeks earlier.

The most important point of all is proper arrangement with the steamship company. If the cases are placed with ordinary cargo it means there will be complete loss. A member of our Society had £38 worth of plants shipped with cargo, and practically every plant died. The cases must be placed in the vegetable room, or some similarly cool place on the steamer, under proper supervision. It is more expensive to send this way, but it is still more expensive to lose all the plants. The freight insurance on, say, four hundred plants, comes to about £5, which is only threepence per plant. We find that, with all charges, it costs about sixpence per plant to land them in New Zealand. Finally, plants are best despatched about January, as they arrive when the weather is getting cooler in the Dominion.

## ANSWERS TO CORRESPONDENTS.

**BROKEN TULIPS.**—*F. I.* Most of the Darwin Tulips are apt to "break" on occasion into more or less irregularly-flamed or feathered flowers. Those who cultivate Darwin Tulips extensively believe that deep planting is one means of preventing this curious variation from the typical form. Branched Tulips were described and illustrated in *The Gardeners' Chronicle* of May 15, 1909 (p. 317).

**FOLIACEOUS PEAR FLOWERS.**—*W. S.* The flowers in which some petals and the calyx segments have become foliaceous provide evidence that the floral parts have been evolved from the foliar ones.

**NAMES OF PLANTS.**—*Reader, Stoke-on-Trent.* 1, *Pyrus japonica* var.; 2, *P. j.* var. *atropurpurea*; 3, too withered to identify; 4, *Cotoneaster Henryana*; 5, *Polygonum baldschuanicum*; 6, *P. cuspidatum*; 7, too withered; 8, *Potentilla fruticosa*. *Mrs. M. W.* *Cytisus monspessulanus*, an entirely different plant from the "Genista" (*Cytisus racemosus*) grown for greenhouse purposes. The former is a native of Southern Europe, the "Genista" comes from the Canary Islands. *G. F.* Malformed flowers of a double Daffodil.

**PEAR TREES UNFERTILE.** *W. E. B.* On the evidence given we cannot state with any certainty why the tree fails to fruit. As there are Pears, presumably of several different varieties in the vicinity, it is unlikely to be a matter of pollination. It is possible that the tree, although of fair age, is still too vigorous to be fruitful. If this appears to be the case, the effect of root-pruning might be tried.

**TULIPS FAILING.**—*M. L. F.* Your Tulips are suffering from a very bad attack of *Sclerotinia parasitica*, and mite and eelworm are also present. We believe, however, that the eelworm is the secondary and not the primary cause of the trouble. The bulbs are far too badly diseased to be cured by any specific, and your best plan is to lift and destroy them, sterilise the soil, and not plant Tulips thereon again for two or three years.

**TULIPS WITH BRANCHED STEMS.**—*E. F. G.* Although Tulips with branched stems are not commonly seen in gardens, they are by no means rare; indeed, there is a strain in which branching, or rather, the production of several flowers on one stem, appears to be fixed.

**TOMATOS LACKING COLOUR.**—*P. C. G.* In our opinion the lack of colour in your Tomatos is due to the need of potash in the soil. This can be supplied by a top-dressing of wood-ash that has not been leached, or by one or two small dressings of sulphate of potash.

**Communications Received.**—S.W.T.D.—W.C.W.—J. H. and C.—W. H. J.—N. M.—W. F. S.—J. A. P.—A. A.—T. A. S.—G. F. G.—G. D. A.—B. L.—Swansea.—C. M. G.—M. C.

REMARKS.—Double white Narcissus and White Stocks are retaining the prices quoted last week some very fine spikes of mauve Stock is being offered. Except for a small

consignment of Narcissus Poeticus from Scotland, supplies from other sources have finished. Other subjects which have increased in quantity during the past week are Cornflowers, Coreopsis, single and double Pyrethrum, including more white, which meets with a good demand, also Iceland Poppies; Gladioli are much improved in quality and include some Giant Salmon and Primulinus sorts. The prices for the best pink varieties of Carnations are a trifle firmer, those of Cupid, Northcliffe, Eileen Lowe, Delight, Mrs. Hemus, Liddle, Winsor and the scarlet varieties Faith Dutton, Spectrum, Aviator and Crimson Topsy, being in demand. Roses were a trifle easier in price to-day, but the best quality blooms in red and white are below requirements, pink and yellow sorts being more plentiful. Some very fine Paeonies are now arriving from the South of France, also some white Pinks and Statice sinuata. Statice Snurwoll and Coreopsis are the latest to arrive from home-growers.

REMARKS.—Business in Covent Garden is fairly active, there being a good demand for the considerable quantities of produce available. Apples from Australasia are a popular feature, as are Grapes and Pears from the same source. A few Grapes are still arriving from the Cape and are selling well. English hothouse fruits are selling freely, although prices generally are rather high, and such fruits as Peaches, Nectarines, Grapes, Melons, Figs and Strawberries are always in demand during the London "season." Tomatoes are more plentiful and Cucumbers slightly cheaper. Moderate quantities of Gooseberries are now being marketed and maintaining a very good price level. Hothouse vegetables are selling well, and English Asparagus is a fairly good trade. Salads are a poor trade. Mushrooms have developed remarkably well and quantities are such that prices are inclined to be low. New Potatoes from France, Jersey and Spain continue to arrive in quantity, and prices all round are lower.

## GLASGOW.

Price movements were narrowed during the past week in the cut flower market, but the general tendency was towards a higher level of values. Carnations were worth 2/6 to 3/6 per dozen; pink Roses, 3/- to 4/- per dozen; white Roses, 2/- to 3/-; red Roses, 1/6 to 2/6 per dozen; Eye Narcissus, 2/- to 3/-; Anemones, 3/- to 4/-; Guernsey Irises, 2/6 to 3/6 per dozen of 6's; English Irises, 9d. to 1/6 per bunch (12's); Sweet Peas, 8d. to 10d.; Clara Butt Tulips, 3d. to 6d. (6's); Paeonies, 8d. to 9d.; Lily-of-the-Valley (outdoor), 3d.; Lilium longiflorum (Harrissii), 2/6 to 3/6; and Richardias (Arums), 3/- to 4/-.

Bedding plants were dearer. Violas made 2/- to 2/6 per box. Coltness Gem Dahlia, 4/6 per dozen; Sweet Peas and other annuals, 1/3 to 1/6; Spiraeas and Marguerites, 1/- per pot.

The first consignment of fruits from New Zealand reached the market on Friday. Winter Nelis Pears sold at 8/- to 9/- per tray. Jonathan Apples realised 17/6 per case; Delicious, 18/6, and Dunn's Favourite, 16/6; while Canadian Winesap Apples averaged 12/6, and Newtown Pippin, 17/6. Valencia Oranges further advanced in price, 300 counts making 22/- to 25/- per case; 360's, 17/6 to 18/6; and 240's, 26/6 to 28/- per case. Grape Fruits were scarce round about 35/- per box.

In the vegetable section Scotch Tomatoes averaged 1/6 per lb., and English and Guernsey Tomatoes, 1/- Cucumbers sold at 5/- to 8/- per dozen; Cauliflowers were worth 5/6; Lettuce, 2/6 per crate; Carrots and Turnips, 1/- per bunch; Mint, 3d. to 6d. per bunch; and Maltese Potatoes, 16/- to 18/- per cwt.

## SCHEDULES RECEIVED.

Covent Garden, W.C.2

## SITUATIONS VACANT

Twenty words (or three lines, including headline),  
4s., and 1s. for every succeeding eight words (or  
line or portion thereof). Fee for having replies  
addressed to this office, 1s. over and above the  
amount payable for all words appearing in the  
advertisement, including our own address.

Advertisers desiring their Advertisements  
repeated must give full particulars. Name and  
address alone are insufficient.

Gardeners writing to Advertisers of Vacant  
Situations are recommended to send them copies  
of testimonials only, retaining the originals.  
To part with original documents is to run a great  
risk of their being mislaid.

When addressing Box numbers, it is essential  
to give the initials or pseudonym as well as  
the correct number of the box.

## MUNICIPAL AND PUBLIC.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council invite applications for the position of COLLECTOR (to assist in the collection and packing of botanical specimens) on the staff of the Botany Scheme, Avery Hill, Eltham, S.E.9.

Scale of Pay, 30/- a week, rising by annual increments of 2/6 to 40/- a week, and temporary additions, making the total commencing rate of pay 54/- a week at the present time, subject to periodical revision according to the cost of living.

Applicants should not be more than 35 years of age, should possess botanical qualifications, and should have had training in gardening in which two years should have been spent at a recognised horticultural school.

Other things being equal, preference will be given to those who have served, or attempted to serve, with the Forces of the Crown.

Apply to the EDUCATION OFFICER (Staff), the County Hall, Westminster Bridge, S.E.1 (stamped addressed foolscap envelope necessary) for form of application to be returned not later than 4th June, 1927.  
Canvassing disqualifies.

MONTAGU H. COX.

Clerk of the London County Council

**WANTED**, Active AGENTS calling at private gardens; would suit seed traveller as a side line.—Apply for information to E. H. W., Box 63 5, Tavistock Street, Covent Garden, W.C.2.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 1d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## PRIVATE.

**GARDENER-BAILIFF or HEAD GARDENER**, thoroughly experienced in both branches; 3 years present place, 10 previous.—HAND, Rickmansworth Park, Herts.
